The Rural New-Yorker.

VOLUME XXXIX, 1880.

INDEX TO ILLUSTRATIONS.

ARBORICULTURAL.

Acorns, bur-oak....201
Chionanthus Virginica, Fringe tree....533
Fagus heterophylla, leaves....765
Forest trees, pruning....6
Japan Judas tree....833
Kœlreuteria paniculata....261
— — seed and capsule of....261
Liriodendron tulipifera....53
Pabria macrostachya....5
Quercus suber, cork oak....264
Tulip tree....53
— — fruit of 54....51
Ulmus parvifolia....54

BIOGRAPHICAL.

Bateham, M. B....549
Beal, Prof. W. J....373
Furnas, Robert W....21
Lyon, T. T....517
Stockbridge, Levi....201

DAIRY HUSBANDRY.

Anti-sucking device....250
Butter making, Danish....359
— packed for shipping....359
Cheese, cream for home use....583
Churn, hand....359
Dairy and ice-house....763
Dairy cow....485
— — stable for....624
Dairy-house....720
Creamery, Ferguson Bureau....57
Ice-house....768
— fork....768
Jersey Queen of Barnet....637
Knife and rammer....167
Milk and ice rooms....751
— can....800
— — lid....800
— collar....704
— closet....782
— cooler....359
— house....719, 737
— shelves....782
Milking tube....638
Pail, milk....653
— — dodges....24
— dairy....657
Prints....102
Refrigerating closet....782
Rennet, to dry a....583
Shelves, milk....782
Spring house....737
Strainer....53, 800
— double....653
Swedish system of creaming....800
Tanks, water....800
Water-tank, sectional view....800
— — with milk cans....800
Well house....737

DOMESTIC ECONOMY.

Dish-mop....159
Milk-shelves, mouse-proof....302

ENTOMOLOGICAL.

Army worm....832
Army worm, larva....380
— — moth....389
— — pupa state....380
Beetle, grape-vine flea....817
Haltica chalybea....817

FARM ECONOMY.

Bolt, carriage, rivet....766
Bowlder before, after blasting....423
Carriage-bolt....766
Corn crib, protection for....55
Gate, with carriage-bolts....766
Hogs, device for hauling up....831
Mole traps....184
Scraper, road and ditch....152
Steaming apparatus....501
Stump before, after blasting....423

FARM TOPICS.

Bolt, carriage, rivet....766
Carriage-bolt....766
Farm, RURAL NEW-YORKER....581
Gate, made with bolts....766
Ice-house....768, 806
— fork....768
Steaming apparatus....801
Stump puller, handy....87
Wheel, to get out of mud....87

FIELD CROPS.

Andropogon furcatus....391
— scoparium....390
Bromus unioloides....215
Caru, Cuzco....166
Cynodon, Dactylon, Bermuda grass....375
Lespedeza striata, Japan clover, 375
Grass June....695
Mangle, Kluver yellow....117
Muhlenbergia diffusa....295
Panicum sanguinale....295
— gracile....295
Plants, Leguminous....69
Potato White Elephant....581, 591
Potatoes within potatoes....70
Poa pratensis....655
— serotina....487
Sorghum Halepense....263, 264
— Nutans....421
— Rural branching....589
Vetch....797
Vicia sativa....797
Wheat, Defiance, shrivelod....585
— — sound seed....585
— — stalks....586
— Eldorado....389
— plants, cultivation....623

FLORICULTURE.

Azalea, Indian....701
Croton "Prince of Wales"....455
— Stewartii....455
Flower Beds, Geometrical....311
Rose, green....453
— tea, Niphetos....251

GARDEN.

Asparagus plants....216
— shoots, blanching....246
Tomato, turban, scarlet....135

HERDSMAN.

Ayrshire Cattle....181
Bull-Holstein....781, 815
— of the Roman Campagna....21
Cow-stall, novel....119
Fire escape, Danish....551
Hereford, bull....21
— — Grateful....537
Heifer, Lady Wildeyes....15th, 121
— Mamie Smith....753
— Panacea....781
Holstein bull....781, 815
— heifer....781, 784
Horns crumpled by art....729
Jersey Queen of Barnet....637
Rack, feed....471
— movable....471
— sled....471
Short-horn bull, Baron Hillhurst....839
Short-horn bull, Duke of Howl John....537
— cow, Lady Wellesley....199
— heifer....73, 408
— "Prime Minister"....328
Short-horns....198
Stable for cows....552
— bulls....392
Steaming apparatus....801
Stock, devices for managing....216

HORSEMAN.

Hoof, horses....801
Horse-shoe, convenient....801
Percheron-Norman horse....587
Shoulder, galls, remedy for....487

HORTICULTURAL.

Aralia monstrosa....519
Dioscorea batatas....213
Calycanthus floridus....717
Currant, Fay's prolific....621
Diameter of small fruits....798
Label, wooden....654
Mistletoe, the....357
Mole trap....535
Mushroom cave....565, 567
— entrance....565
— passage....569
Mushrooms ready for market....566
Pruning shears, long, small....219
Raspberry, Caroline....831
Raspberry, Gregg....165, 551
Seed-house, Vick's....786
Strawberry, Bidwell, No. 1....584
— — No. 2....584
— Boyden....149
— Charles Downing....149
— Cinderella....502
— Cumberland Triumph....149
— Gen. Sherman....501
— Glendale....501
— Longfellow....584
— Marvin, No. 1....584
— — No. 2....584
— Monarch of the West....149
— Nunan....261
— Primo....502
— Seneca Queen....503
— Sharpless....149, 501
— Windsor Chief....502
Sweet-scented shrub....717
Veteh....797
Vicia Sativa....797

INDUSTRIAL IMPLEMENTS.

Butter workers....85
Clover separator, Monitor....265
Corn drill, Hoosier....255
Creamery, Ferguson Bureau....57
Drill, Empire grain and fertilizer....169
— Hoosier grain....201
Engine, Hookwalter....362
— safety steam....565
Evaporator for sugar....169
Grain drill, Buckeye....394
Harrow, Acme steam pulverizing....105
Harvester, Bradley's American....249
Marker, adjustable....247
— simple adjustable....316
— Cane, Star....425
Mill, corn and feed....121
— — I. X. L....105
— — Victory....9
— Era....249
— grinding, Nordyke & Marmon's....27
— plantation and farm....249
— portable, excellent....817
Mole trap....535
— — and gopher....247
Plow, Diamond iron....249
Pruning shears, long, small....219
Rake, Bay State....185
Reaper, Anson Wood's No, 3....169
Rotary motion, Ryther....377
Saw, Grant riding....27
Spring bolster, Pulliam's....7.7
Sugar extractor, Centrifugal....329
Telephone, Brooks's loud-speaking....249
Thrasher, Invincible....391
Wind-mill, I. X. L....281

INDUSTRIAL TOPICS.

Oleomargarine, churning....313
— delivery room....341
— melting room....313
— packing for retail....312
— — in firkins....343
— press room....341
Tea leaf curing....689, 691
— — implements for curing....693
— — Indian....688
— — its product....691
— — kinds of....687
— — machinery for curing....694
— leaves, uncurled....695
— plant....685

LANDSCAPE GARDENING.

Curve, faulty....278
— too sharp....278
Embankment....279
Ground outline....279
Sky outline....279
Walk, flowing curved....279

MISCELLANEOUS.

Fire escape, Danish plan....551
Vase, prize....41

POMOLOGICAL.

Apple, Bethel....103
— Clark....815
— Cranberry Pippins....7
— Davenport....23
— French Paradise....245
— — flowers of....245
— Magog, Red Streak....55
— Mountain Tulip....199
— Simmon's red....519
Pear, Aston Town....151
— Beurre Clairgeau....151
— Duhamel de Monceau....246
— Hoosic....246
— Iron's Favorite....358
— Pitmaston Duchesse....246
— Souvenir du Congres....183
Plum, Japan Eriobotrya Japonica....309
— outline of Wild Goose....586

QUERIST.

Barn, convenient....707
— trees....554
Chickens, marking....299
Cisterns, stone, to build....298
Dairy barn with lean-to....803
Lime-kiln floor....578
Privy vault....787

RURAL ARCHITECTURE.

Barn, convenient....133
— general purpose....294
Country villa, $3,000....784
Dwelling, country, $1,500....335, 327
Farm-house, first-class....469
Green-house, a cheap....405, 407
House, country, $3,000....784
Ice-house....133, 768, 816
Rural New-Yorker office....293
Stanchion for cattle....294

SCIENTIFIC AND USEFUL.

Electric light, forcing plants by 297

SHEEP HUSBANDRY.

Cotswold-Merino ewe....376
Goats, varieties of....720
Lambs, Oxford Down yearlings 104
Merino ram....654

THE POULTRY YARD.

Brooder....784
Chicks, artificially....783
— eating, teaching....783
Incubator....784

SWINE-HERD.

Berkshires....197
"Hog-rope"....216
Irish greyhound....197
Poland-China....197
Trough, good pig....817
Yorkshire sow, prize....72

VETERINARY

Needles....672
Wound....672

VINEYARD.

Grape, Bacchus....813
— Eumelan....85
— Jefferson....733
— Lady Washington....689
— Naomi....749
— Vergennes....277
— vine, fleas on....817

INDEX TO PRACTICAL DEPARTMENTS.

APIARIAN.

Apiary....264
— best form of....506
Bee account for 3 years....120
— glue from the hands, removing....43
— house, novel....488
— keepers, aids and helps....200
— keeping, profits of....506
Bees, Cyprian, introduction....41
Bees in Winter....845
— feeding....88, 315
— — in Winter....786
— how much to increase....407
— in Utah....344
— Italian....135
— keeping....6, 7
— Ligurian hunoy....818
— queen by mail....135
— September management of.642
— Spring hints....88
Colonies, increase of....377
— prolific queens for....377
Drones....377, 506, 753
Handling, best time....406
Hive, best....506
— make your own....204
Honey stock, surplus, care of..377
Moth and worms....506
Queen by mail....135
— the....568
Queenless colonies....506
Queens, to introduce....506
— to rear....506
Robbing....506
Transferring....506
Wintering....506, 689

ARBORICULTURAL.

Abies Sibirica, sowing seeds of. 134
Acer circinatum....22
— Colchicum rubrum....22
— striatum....22
— Tartaricum Ginnali....22
Æsculus, double-flowering....818
Allanthus, merits in....814
Ash, white....724
Arbor-vitæ, American....708
— — Geo Peabody....702
— — Little Gem....738
— — white-tipped....738
Birch, purple-leaved....236
Birches....121
Catalpa....567
— as a timber tree....473
— Kumpferi, dwarf....524
— speciosa....9, 738
— Syringæfolia aurea....251
Cherry as a lawn tree....294
— — an ornamental tree....294
— wild black....724
Chionanthus, virginica....533
Clethra alnifolia....524
Coffee tree, Florida....70
Beech, cut-leaved....765
Elm, a rare....64
Eriobotrya, Japonica....357

THE LONG-RACEMED BUCKEYE.—(Pavia Macrostachya.)—Fig. 1.

Arboricultural.

THE LONG-RACEMED BUCKEYE.
(Pavia macrostachya.)

Our first-page engraving is a very accurate picture of the leaflets and flower racemes of this fine hardy shrub, drawn during the past summer from a specimen plant at the Rural Grounds. We have often alluded to it before and never, perhaps, without expressions of regret or surprise that it is so rarely seen in our gardens and lawns. This is simply because it is not well-known, for nurserymen's catalogues offer it at the usual price of such shrubs, and it can scarcely fail to please those who give it a fair trial. It is very distinct and possesses features belonging to no other shrub that we have ever seen. The five leaflets droop almost as much as those of Mandrake (Podophyllum peltatum). The long, vertical spikes of buds, at an early stage bring to mind the spikes of Plantain. They grow until they become a foot or more in length, the flowers meanwhile unfolding until all are in bloom. Broader than high, the outside stems of the plant hug the ground for some little distance and then grow up forming a hemisphere of foliage. Adorned with its many racemes of fragrant, hyacinth-looking flowers and blooming in July and continuing to bloom for a long time when most other hardy plants have ceased, few plants will give more pleasure.

We know of specimens which are 50 feet in circumference and eight feet high. Our largest specimen is four feet in hight and 15 feet in circumference. It bore last August 50 racemes of flowers and is now five years old—that is, it is five years since it was taken from the nursery. We could quote many of our best horticultural authorities to prove that it should be found in every collection whether large or small, and we hope our readers will place it in their lists to be ordered next spring. It is a native of South Carolina and Georgia.

HORSE CHESTNUTS.

SAMUEL PARSONS JR.

There are truly Horse Chestnuts and Horse Chestnuts. The number of distinct species and varieties may be estimated at scores. Most common of all on lawns is the well known Horse Chestnut, Æsculus Hippocastanum, so called, some say, because the form of a horse-shoe may be conjured out of the shading of the nut. At any rate, common peculiarities mark nearly every species and variety of Horse Chestnut, whether the horse-shoe be there or not. All have large, light-green, shadowy foliage; are more or less round-headed and have massive spikes of solid-looking flowers. Flowers, indeed, make the chief attraction of the tree. All Horse Chestnuts, moreover, put forth leaves early in spring, yet before autumn, if not before August, many of these leaves fade and become discolored. None of the varieties like a sandy or dry soil, and all especially need liberal feeding, that is, fertilizing. All are worthy of distinguished, isolated positions on the lawn, and group finely together in considerable masses. This is especially true when the eye looks down from above on the leaves parted on every hand by splendid clusters of flowers. So persistent are these peculiarities that I question whether they do or not, to a great extent, in the several species and varieties overshadow other differences. There are few genera of trees whose respective species and varieties look so much alike, to the casual glance, as do those of the Æsculus. Yet, on examining the flowers, fruit and even foliage, the different species and varieties are notably distinct.

There are two sections or subgenera of Horse Chestnuts according to many botanical works, although the best authorities speak of Æsculus as an all-embracing genus. The Pavias, as a genus or subgenus, have proved distinct enough to gain a decided foot-hold in the minds of the general public. Yet their distinctions from the Æsculuses, we must acknowlege, are not very sure. Most, not all, of them have smooth husks on the nut, while the shell of the Æsculus is always prickly. Generally, the Pavias are low trees or bushes. Propagators also say they can most surely tell the Pavia from the Æsculus by the smooth, dry buds of the former and the gummy, sticky buds of the latter. They say this test never fails. The largest, tallest tree of the Æsculus section is the common form of Æsculus Hippocastanum, with the typical light-green foliage of Horse Chestnuts, so lovely during the time of putting forth. Like those of most Horse Chestnuts, the flowers are early and only peculiar from their white color. The stamens are prominent and purplish or yellow. Perhaps, as a whole, we appreciate this Horse Chestnut as much as any. True, as every one has noticed, the leaves do fade early in August; but what will you have? Nothing is perfect.

We have many varieties of the Æse. Hippocastanum more or less distinct. There are pyramidal forms, dwarf pyramidal and other dwarf forms, which again have lapsed into a weeping variety. Crisped-and curled-leaved kinds may be seen. There are cut-leaved and dissected kinds, the last cut into mere shreds of leaf tissue. They are all very curious, certainly, and quite distinct when we come to examine them more closely.

Æsculus Memmingerii deserves special mention for its fine foliage distinctly dotted with white spots, and there is also a maculated kind, more or less marked with golden spots. This coloring changes in other varieties, as in Æse. variegata and marginata, while either form or color again differs in the beautiful Æse. alboflore pleno, serotina, pavioides, fructu-eduli, spectabilis, nigra and procera. But I must stop. Our array of names is already overwhelming. Sometimes the names themselves are sufficiently descriptive, as in pyramidalis. Generally, though, the kinds I pass over thus rapidly are not specially distinct or striking. Æsculus rubicunda, however, is a species possessing distinguished qualities. I have only to look at a certain specimen standing in a prominent place in Flushing, to feel ready to use strong expressions in its favor. In late spring and early summer this tree is a great globe of rich green, heavy foliage, literally studded with large clusters—bouquets, I might say—of bright pink flowers. Good authorities term it a cross between Æsculus Hippocastanum, and some Pavia or Buckeye. It is certainly of lower growth than many of its immediate relatives, and has much of the glowing color of Pavia rubra, etc. I do not think I am exaggerating when I say that Æculus rubicunda is the decided favorite among Horse Chestnuts employed on the lawn. It grows very slowly, and hence is usually grafted on the more rapid Æse. Hippocastanum.

When we turn to the Pavias or Buckeyes, we find a tolerably distinct class, except for the hybrids that shade in to the so-called Horse Chestnut type after the fashion of Æsc. rubicunda. Pavia rubra has, perhaps, the most value for the lawn planter, and this, again, is called Æsculus Pavia, from its resemblance to the common Horse Chestnut. Its flowers are a brownish-scarlet and the branches slender. The tree is not large.

Besides these, there are Pavia rubra atrosanguinea and Pavia rubra Whettleyana, with small, brilliant red flowers and rich foliage. The trailing, P. humilis is also an interesting variety and when grafted high on the Hippocastanum it is an elegant, curious tree, especially when it assumes a weeping form. Pavia glabra, the Ohio Buckeye, is of good size, with pale-yellow flowers. It does not compare in beauty, however, with Æse. Hippocastanum. Pavia pallida is a variety of glabra. Pavia flava and flava purpurescens are still other Buckeyes with flowers more or less yellow. Then there is the interesting Michauxii and many more distinct species and varieties. Loudon speaks of P. neglecta with pale yellow flowers veined with red, and makes it a hybrid between P. rubra and P. discolor. P. discolor is a straggling bush rather than tree and, though early flowering, remains in bloom a considerable time. It is well fitted to make picturesque small trees by grafting on strong stocks. Pavia macrocarpa is an ornamental tree, open-headed, and graceful, not merely round and somewhat formal, like the Æsculuses generally. It is said to be a hybrid between Æse. Hippocastanum and Pavia rubra. Pavia Californica is much admired as a low spreading bush with rose-colored flowers blooming at midsummer. There is also an interesting Æsculus Chinensis. Pavia parviflora is a low-growing tree or bush, a real Buckeye of the West. All the Pavias are used with effect upon the lawn, but, as a whole, they have not the ornamental value of the Æsculuses. I except, however, from this statement Pavia macrostachya which Spach, Lavallée and others class in a distinct genus, Macrothyrsus, so different is it from other Pavias (See engraving). It is a low bush, broader than it is high, because the slender shoots, as they spread, root at any joint that may happen to rest on the ground. The foliage is large, that of a common Horse-Chestnut to all intents and purposes, but the flowers are in pure white spikes and fragrant. The stamens project much and are very ornamental, and the blooming occurs in midsummer. In fact, its late period of blooming, a broad vigorous bush form and immense spikes of beautiful flowers make it one of our best ornamental plants.

This is truly a cursory view of so noteworthy a group as the Horse Chestnuts, but their resemblance to each other has induced me to give the consideration of many species and varieties less space than I should have done had they been Maples or Oaks.

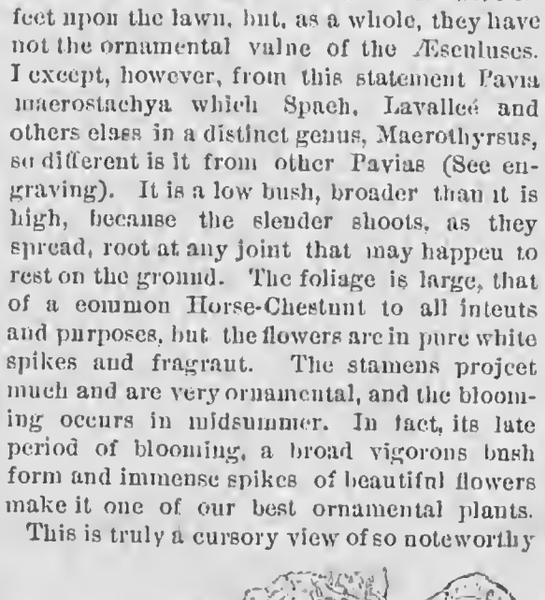

Fig. 4.

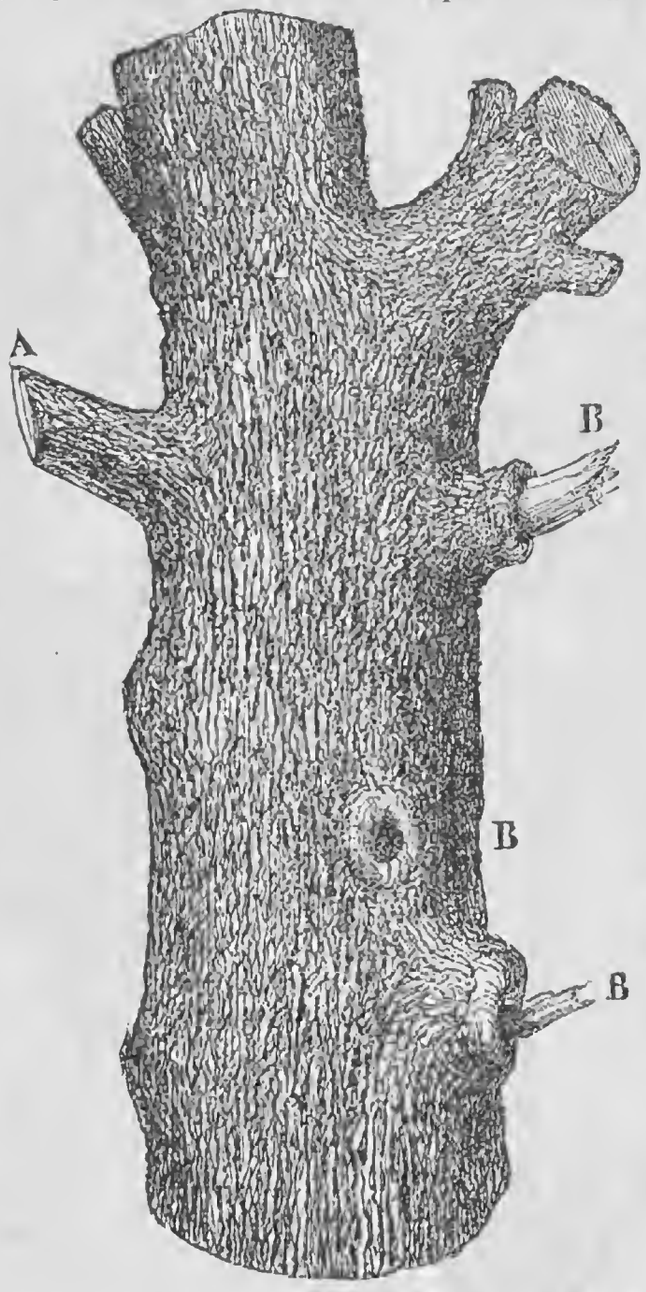

Fig. 2.

Fig 3.

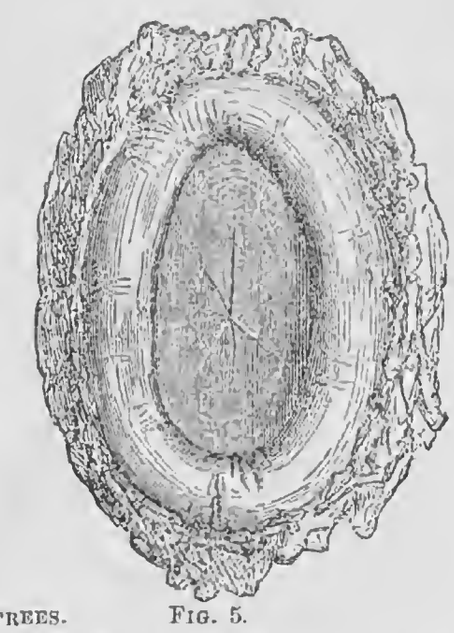

Fig. 5.

PRUNING FORESTTREES.

PRUNING FOREST TREES.

At this season of the year, when the work of removing and trimming large trees is generally done, it will not be amiss to give a few hints in regard to the pruning of forest trees, and, indeed, of all trees from which large limbs are to be removed. It is usually so much easier to cut off large limbs some distance from the trunk—as the tools can be more conveniently handled than when cut close to the body of the tree—that the average workman, who has no interest in the appearance and well-being of the trees afterwards, is very apt to leave a long, unsightly stump for each large branch lopped off. Fig. 2 shows how a tree appears when pruned in this style. The rugged appearance, however, is not the only objection, nor, in the case of forest trees, is it the most important one. The remaining stumps will eventually decay and form holes in the trunk. In these the rain will collect, and the decay will speedily be carried into the heart of the tree, thus destroying its value for timber.

The stumps at and above A are one year old after pruning. The vitality has left them; they are but dead wood and have begun to crack open from the influence of the weather. The new layer of wood that yearly enlarges the tree cannot, in this case, cover the wounds while the wood is yet sound. At B is shown the appearance of such stumps several years after pruning. They have here wholly or in part decayed, but the wounds are still unclosed and the decay is rapidly working inward. In Fig. 3 is a better illustration of the same case. The old branch is slowly disappearing, the many cracks furnishing lodging-places for the atmospheric moisture, and the new wood is bulging out in a gnarled growth in the unsuccessful attempt to cover the wound. Fig. 4 shows such a wound when the stump has finally decayed, B. B. being the lips of the new wood gradually approaching each other, and C. the still intervening opening. In the same figure is shown a section of a similar wound, in which the wood of some 12 or 14 years' growth is destroyed. Fig. 5 is a good illustration of a wound as it appears a couple of years after the branch has been properly cut off. The stump is here so short that the forming layers of new wood can cover it before any damage has been done by its decaying. The timber will be unharmed, and the tree, for ornamental purposes, present a much neater appearance. The above cuts which we have re-drawn, were originally published in the London Garden.

No large branches should ever be cut from any tree unless they are dead, or they, for similar urgent reasons, must be removed. But when they must be cut off, the cut should be made close to the trunk, and the wound covered with grafting-wax, tar, clay, or a similar substance that can prevent the moisture from taking effect. In the laying out of new places, as well as in the improvement of old ones, it is often desirable to retain a few giant Oaks, Chestnuts or Tulip Trees, but to lessen the power of the wind in their crowns, or for other considerations, it is sometimes necessary to remove part of their tops. This may be done to good purpose, but it should be borne in mind that long stumps are not only an eye-sore, but they will eventually interfere with the health of the tree and reduce its value for timber.

Pomological.

OHIO STATE HORTICULTURAL SOCIETY.

A Progessive Organization and Meeting.

The thirteenth annual meeting of our State Horticultural Society occupied three days the past week, and was fully up to the usual standard in attendance and interest, although rain and mud kept many from being present, and the location (Canton) is in the midst of the oldest wheat-growing district, where most of the residents or their parents, came from Pennsylvania or Virginia, and are not noted for their interest in horticultural or modern improvements generally. But, through the efforts of a few enterprising farmers, a county Horticultural Society was formed here the past spring, which has held a number of good meetings, with exhibitions of summer fruits, and already awakened considerable interest, the effects of which were manifest at this meeting of the State Society, which was appointed there on the invitation of the local Society; as it is the practice to change the place of the annual meeting each year, so as to reach and benefit all quarters of the State.

There was quite a good show of fruits at the meeting, considering that this is the "off year" for our apple orchards, and all kinds of late fruit ripened so early in the fall that but few remain sound at this time.

The first business of the meeting, after the appointment of committees, was to hear a report from the secretary of the doings of the Society and its Executive Committee for the past season.

The difficulties and failures of the old orchards constituted the first topic of the programme for discussion the next morning; the question being. "How can the old orchards best be renovated, and is it not better in most cases to cut them down and plant new ones." The writer of this and one or two others took the ground that apple trees cannot be expected

to last for ever, but should be counted as having about the same average duration as man—say 60 to 80 years, under favorable circumstances, and that on thin soil with poor treatment a period of from 50 to 60 years was as long as the trees could be expected to yield any profit. Hence it is full time that a large share of the orchards were cut down, as not worth the trouble and expense of renovation. At any rate no time should be lost in planting new orchards where they are desired to take the places of the old ones, which should be cut away as soon as the young trees afford a home supply of fruit. Various methods were suggested for renovating orchards, by plowing, fertilizing, pruning etc.

Next was an able essay on the science and practice of pruning, by G. H. Miller, of Norwich. The next topic was, codling moths and canker worms—how to combat their ravages—Most of the speakers deemed the band method of trapping the moths too laborious or troublesome for large orchards, but thought they were the best where pasturing with hogs or sheep cannot be practised. Several spoke of the efficacy of the latter method, and urged all farmers to adopt it, as a cheap and easy way of securing fair and merchantable apples. Complaint was made that sheep are apt to injure the trees by eating off the bark, and it was replied that this can be easily prevented by washing the bark with strong soap-suds in which a small quantity of carbolic acid has been stirred—say an ounce of the crude, or half an ounce of pure acid to a pailful of soap-suds. It will not need to be applied more than once in two months, or twice in a season. The same wash will prevent the attacks of borers, and the gnawing of rabbits and mice.

Methods of Evaporating Fruits.

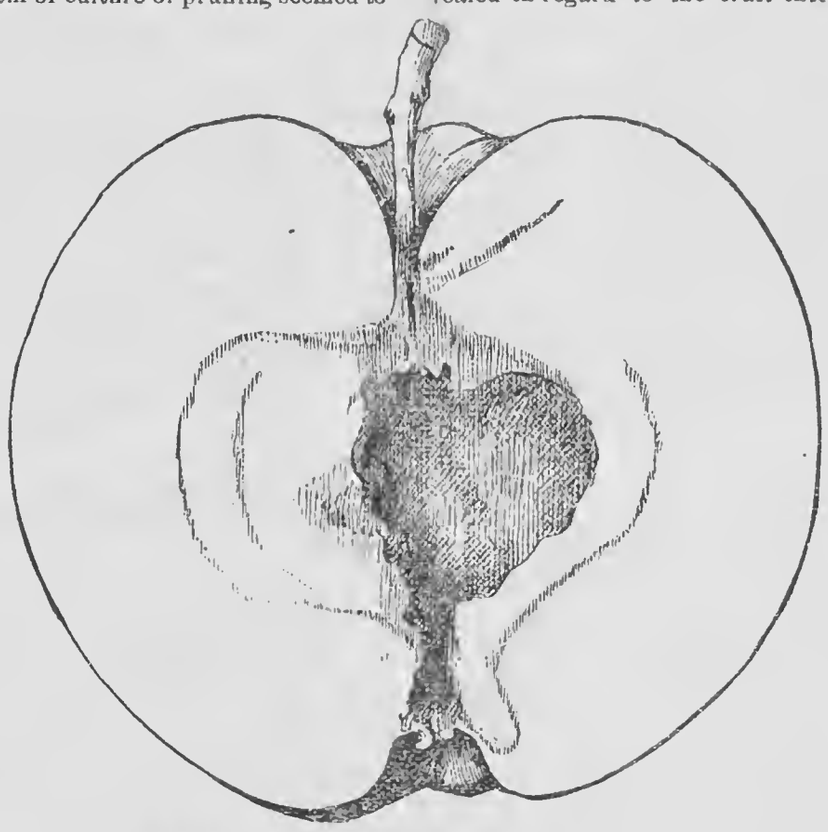
An essay on evaporting fruits by the use of the "American Fruit Drier," by Jas. Edgerton, was next read. His apparatus was of small capacity, costing only about $60, and designed for farm use. He regarded it as the best contrivance of its kind, and a good instrument for orchardists who are distant from market, or liable to have a surplus of fruit, especially such as have children or can hire suitable help for paring and handling the fruit. The quality of the dried fruit is the same as of that dried by the Alden process, and vastly better than that of ordinary dried fruit. He found it pays better to dry Black Cap raspberries by this method than to ship them in a fresh state.

Mr. S. B. Mann, Mich., was present as delegate from the Michigan Pomological Society, and, by request, gave an account of a very large establishment of which he is manager, for evaporating fruits by the Alden method, using three large machines, which, with the buildings and appliances, cost $10,000, and, when in full operation, uses at the rate of 400 bushels of apples per day. It was started five or six years ago as a stock company, by a number of farmers having orchards, and, after heavy losses by fire and other causes, most of the owners were discouraged, and sold their interests to the present company, who revived the business and have run it for several years with fair profit to themselves and much benefit to the farmers around. The market is also improving for the evaporated fruit, both for export and use in this country, so that they are confident the business will pay better in the future than it has in the past. Mr. Mann, on being asked about the use of sulphur for bleaching the fruit and improving its keeping quality, said his firm had adopted that method, but the question as to paying any patent royalty had not yet been fully settled. Remarks then followed about the dispute that is going on in regard to this patent question, between the fruit-driers of Western New York and the Ohio man who claims to have a patent for the sulphur process, by which it appeared that the validity of the patent is likely soon to be tested in the courts.

Grape Culture. New Varieties. Diseases.

Mr. G. W. Campbell, who is our standard authority on varieties of Grapes, read an essay on the new Grapes as observed the past season, speaking especially of those exhibited at the show at Rochester, and some he had seen elsewhere. The writer of this also gave his impressions of a number of new Grapes, especially those examined by him at the Rochester exhibition and in gardens about that city. Mr. High, of Middle Bass Islands, gave the results of his experience with the Brighton and several other new Grapes. Specimens of the Prentiss Grape, sent by Mr. Hubbard, of Fredonia, were exhibited at the meeting, and made a favorable impression as to its appearance, flavor and keeping quality, the only doubt being as to the vigor of the vine, and its ability to withstand disease in this climate. All who had tried the Brighton, or seen it fairly tested, spoke well of it; much confidence was also expressed that the Niagara and Pocklington would prove valuable in Ohio; perhaps also the Duchess and Lady Washington, at least for amateur culture, their fine quality rendering them worthy of careful trial, and, if necessary, the use of sulphur to prevent mildew. Favorable mention was also made of the "Rochester" and "Monroe," seedlings of Ellwanger and Barry, and of Mr. Ricketts's "Jefferson."

Discussion on grape rot showed that this disease had not prevailed very generally in Ohio the past season, owing, it is supposed, to the dry summer; though in some localities the disease was quite destructive. Several persons testified that it invariably made its appearance during hot and rainy or sultry weather, and that no system of culture or pruning seemed to have any effect in its prevention, unless the vines or clusters of fruit were sheltered from the weather, as by a coping of boards over the trellis, training against buildings or inclosing the clusters in paper bags. My abstract of the discussion on this subject at the Rochester meeting, as published in the RURAL NEW-YORKER of Nov. 29, was read, and the facts and inferences met a general assent.



CRANBERRY PIPPIN.—FROM LIFE.—SECTION.—FIG. 6.

Essays By and For the Ladies.

One of the surest signs of progress in our State and County Societies, is the interest taken in the meetings and proceedings by ladies. The second evening of this meeting was especially the ladies' benefit, and quite a number of those of the city, as well as from the country were present. First was the reading of an essay by Mrs. Helen V. Austin, delegate from the Indiana State Horticultural Society, entitled "Women as Horticulturists." It was of considerable length, and marked ability, containing many good hints and points which elicited frequent applause. Mrs. Austin, in advocating the rights and privileges of women and their fitness for the pleasures and employments of horticulture, showed up in strong terms the conduct of very many farmers in denying to their wives and children this natural and cheap source of recreation and enjoyment.

Next was an essay by Mrs. J. K. Niesz, wife of the president of the County Society, on the influence of Horticulture on Rural Life. This also was quite timely and good. Then followed an excellent and practical paper by Mr. M. Milton, of Youngstown, O., who is a well educated florist and a good writer, on Window Gardening and the care of Winter-Blooming Plants.

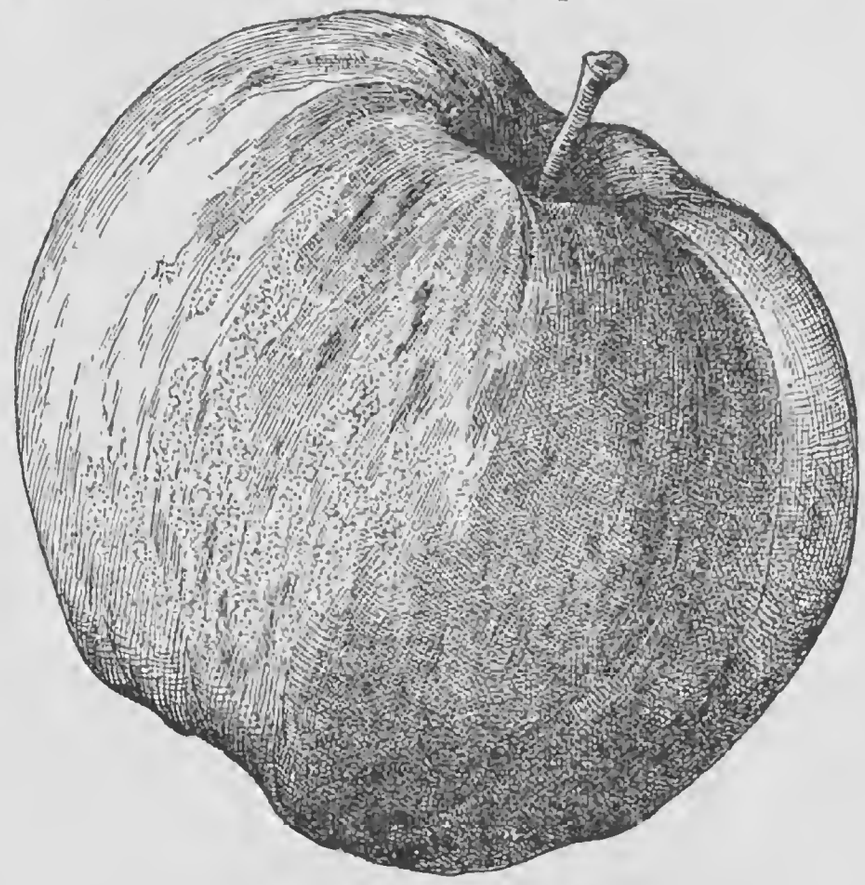
I find that space will not permit me to glance at the practical topics of our third day's discussions; such as raspberries, strawberries, new peaches, plum culture, curculio, black knot. These, with the essays and speeches, will be published in our annual report of which 20,000 copies are printed each year by the legislature, as an appendix of the State Agricultural Report, and 500 copies in pamphlet form for members of the Society.

Painesville, O. M. B. BATEHAM.

The Fruit Interest on Lake Michigan.

At the recent meeting of the Michigan Pomological Society some instructive facts were revealed in regard to the fruit interest on the Lake Shore. Last winter the Legislature of Michigan passed a law for the suppression of yellows in the Peach, by directing the prompt destruction of all diseased trees. It was shown that in South Haven and the surrounding country, where the fruit-growers had rigidly enforced this law, there were but three and-a-half per cent. of diseased trees for the season, and men in that vicinity are confident that if the supposition that the yellows spread only by contagion is correct, the prompt extermination of all affected trees will reduce the annual loss to about three per cent. An interesting point was also brought forward concerning the value of local Horticultural Societies. The best fruit was marketed from points throughout the State where live Societies were at work, while in localities where there were no Societies, mostly second-class fruit was marketed. Many of the fruit-growers present acknowledged that they, in great part, owed their success to the hints and encouragement they had received from the Societies.

It is found almost impossible to enforce the yellows law in districts where there are no Societies through which people may co-operate in their work, and by discussions on the subject learn that it is for their benefit. People, however, are gaining faith in their ability to hold the disease within bounds, and the present indications seem to show that in a few years all the high land bordering on the lake shore and extending back from 10 to 20 miles will be planted with Peaches and various other kinds of fruit. Western Michigan fruit-growers, who formerly shipped only to Chicago, are commencing to send direct to cities further west and north. The probabilities are that the western fruit trade will be greatly developed, in which case there will, most likely, be no locality in the country that can offer better inducements to fruit-growers than western Michigan. F. A. G.



CRANBERRY PIPPIN.—FROM LIFE.—FIG. 7.

THE CRANBERRY PIPPIN.

This very beautiful apple, of which we here give illustrations, originated on a farm near Hudson, N. Y. It does not appear to be widely known, comparatively few being found in the market. The specimen here presented we bought one day while strolling through Washington Market, in this city, where this variety readily sold for $5 a barrel. We cannot affirm as to the suitability of the tree to all sections of the country, for, as far as we are aware, it is as yet cultivated only in the East, and there to a limited extent; but the tree is said to be a vigorous grower and very productive. The size and beautiful appearance of the fruit make it very attractive, and therefore excellent for market. It is medium to large, roundish-oblate and regular. The skin is thin, very smooth, of a light yellow, with a bright scarlet cheek, the red flush sometimes spreading over the greater part of the apple. In point of flavor it is not a first-class apple, though for cooking purposes it is unsurpassed. The flesh is white, tender, pleasant, subacid and quite juicy. It is in use from November to the beginning of March. It is worth trying in all localities where fruit will thrive. Wherever it does well, it will rank among the best as a market apple.

ORCHARDS IN ILLINOIS.

A. C. WILLIAMS.

THAT there are so many farmers to whom it has never occurred to put out an orchard, is indeed strange—and farmers, too, who have supplied themselves and families with almost every other comfort. Even in the great State of Illinois there are entire neighborhoods in which there is not one good orchard. Especially is this the case in many prairie districts. I have seen several such places within the last fortnight: farmer-like residences on either side of the highway, manifestly built years ago; mammoth barns, and tasty out-houses in keeping with well kept farms; miles of well grown hedges; meadows dotted with stacks; fat cattle roaming upon the verdure of a "thousand hills" in township-like pastures, but no orchard to furnish fruit for the family. In timbered districts such farms are not so common. We may account for the absence of orchards in the prairie districts, however, by reasons other than sheer neglect; but I will not undertake to do so here, since negligence is the main trouble. Certainly those farmers do not let their families do without fruit, so that the money expended for it, any year, would quite equal the cost of trees and planting.

At this day, with the priceless advantages of the agricultural press, pomological books, and societies, common sense is all that is requisite, for one not only to put out an orchard, but to do it well, and know, or *find out*, exactly what to plant in his particular locality, climate and soil. For Illinois, till something first-rate in quality is found, nothing is better than Ben Davis in the way of apples for winter, Hubbardston Nonsuch, Snow (Fameuse), Maiden's Blush, Rambo, or Porter for autumn and early winter, and Astrachan, Duchess of Oldenburgh, Primate, or Red June for summer. Of course, there are many others that do well in Central Illinois, but this list is intended for beginners who would probably set out a plain and unpretending orchard, if they only knew a few sorts that would be certain to succeed with half a chance—orchards in Illinois seldom get a whole chance.

Most families, however, would want for winter more than one sort, and I might add Winesap, Westfield Seek-No-Further, or Jannet, and for a sweet apple, Talman Sweet. There are scores of other sorts deservedly popular, a few of which I cannot refrain from naming and pointing out certain defects they are subject to when grown here. The Eastern man who comes West expecting to grow Baldwins, Spys and Roxbury Russets, and enjoy them in their perfection, as he has from boyhood, will generally be sorely vexed and disappointed, since they are almost always unreliable here. The first-named, as I have seen them, are imperfect, ripen prematurely, and are damaged badly by dry, rotten specks, while on the tree. Spys come to perfection, and *such* perfection, but are ripe and must be used long before cold weather. Such has been my observation, no matter what the care and treatment have been. Roxbury Russet is open to the same objections as the Baldwin, except, perhaps, that it may not rot on the tree so badly.

Of Cherries, I have experimented with Dukes, Hearts, Bigarreaus and Morellos, and here in Illinois, especially in the central portions, I would advise the inexperienced to hope for fruit from the Dukes only, and of them the "Early May" (May Duke as we call it), is the best; still any of the various sorts belonging to the Duke family is not likely to disappoint the planter.

It is a very common practice to set cherry trees in the yard, here, and if Dukes, worked on Mahaleb stock, were used, it would not be bad, but nearly always the worst old scrubby seedling Morello stock in the country, is used

and, sprouting as they do, the yard is soon spoiled and made a wilderness with very little fruit. I believe those who have yet to put out orchards will never regret it, if they will select a piece of land, make the orchard on it, and keep all fruit trees banished from the lawn or yard. It is neither elegant nor suitable in any possible sense to make orchards of the yards, where little or no cultivation can be given, and those "old-fashioned" cherry trees, as we term them here, are even unfit for a well kept orchard. They might do very well for shade, planted in lots where hogs are kept, but they soon become ugly jungles and bushy thickets, no matter where they are put. What I have said in this article is for the benefit of the class referred to at the beginning, and I shall have something to say about Peach, Plum, Pear, Quince and berries next time.

Douglas Co., Ills.

PEAR BLIGHT AND SALT.

It is amusing to read the varied experiences of Pear growers after the application of salt on their orchards, which have been called out by Gen. Noble whose pear orchard by the sea-side is not affected with blight. Mr. Woodward, in the interior of New York, has applied salt, also wood ashes and bone dust. He has a good orchard and no blight; while your correspondent, H., from Ontario Co., N. Y., has applied salt liberally and killed his trees; or else all died from blight. Mr. Woodward's trees are Duchess, short-jointed, slow growers and not much subject to blight. Perhaps if he had mixed sand instead of salt with his ashes and bone dust, the results would have been the same, for ashes and bone dust are like the meal put with saw dust for horse food—the more meal, the better.

What causes blight, and the remedy are great questions, and especially with us in Georgia who claim to have the best country for Pears and Peaches in America. Out of 4,000 pear trees, I have lost about 400 with blight in the last three years, mostly the Bartlett, Clapp's Favorite and other rapid growers. The Duchess and Seckel have not blighted. Two Barlett tress planted on each side of my smoke-house where the roots have access to salt, have not blighted, while other Bartletts 20 feet off, blighted. This would argue somewhat in favor of salt. My observation of the blight led me to conclude it was caused by extreme and sudden cold or heat affecting the succulent, more rapid-growing sorts, like the Bartlett and others; while the slow growers were exempt. Acting on this thought, I allowed my pear orchard to grow up in weeds and grass without any cultivation this year. The growth was retarded and the blight stopped. But says one: "This is not a blight year; it comes in waves and when the wave is over, the blight stops and every fellow's remedy hits, and is THE remedy, until another wave comes and washes it all out." Let us have more experience on salt.

Spalding Co., Ga. W. W. WOODRUFF.

NOTES ON INFLUENCE OF STOCK ON GRAFT, ETC.

I HAVE been much pleased with the many articles which have appeared in the RURAL on the influence of the stock on the graft. But it rather surprises me that so few experiments have been tried, or, if tried, that so few have been reported.

There is no orchardist of the present day who is not well aware of the fact that the stock has a great influence for either good or bad on the graft; but few are aware of the cause of that influence, or of a practical remedy for the evil effects. I have been much disappointed in that none of the many able contributors of the RURAL has suggested some method that would lead to something beneficial. Grafting on whole seedling stocks, is no remedy, as some of your contributors appear to think, because there is in the quality of the fruit from such trees as much variation as, or more than there is when grafted on short pieces of old roots. If it were not for the loss in propagation by cuttings and the unhealthiness of the majority of such trees, a partial remedy might be found. At any rate, the fruit would be of an even quality, although inferior to the best grown on grafted seedlings, because some stocks improve the quality while others hurt it. The nurseryman who is first able to control this influence and can supply us with trees that are certain to bear the very best fruit, may consider his fortune as made. In the meantime, for private use, I have for some time practised the following method which so far has been satisfactory: If I want a fruit tree that will bear a superior quality of fruit, I search all the orchards within reach for a tree of the particular variety I require and hat bears the very best quality of fruit. This tree when found, I mark, and at the proper time I take both cions and short pieces of healthy roots on which I graft the cions. I then have a tree with the same roots and top as the one from which they were taken, and providing the soil, location, etc., are similar, the fruit has "in all cases that I have tried," been equal in quality to that of the parent tree.

T. F. FORFAR.

The Herdsman.

THE JERSEYS.

RICHARD GOODMAN.

THERE is some excuse for the mistakes of the reporters of the daily papers in their accounts of the International Dairy Show, when they mix up the breeds of cattle in sad confusion, miscall the names of the prominent breeders, refer to the herd of "Jerseys" entered by one competitor and the "Alderneys" by another—no Alderneys being there at all—and no carping owner of stock would say, "Has this fellow no feeling of his business?" for it is not his business, and the various races of cattle are as much a novelty to him as the mowing of the parks is to the eager crowds that hang about the slow city scythemen in early spring.

But when we read in the report of an address before the Massachusetts State Board of Agriculture, by a veteran breeder of Devon stock in Connecticut, that "Alderneys embrace the Jerseys and Guernseys," just as the minister apologises for always using the term men, because it embraces women—the men certainly do—we are apt to become cantankerous and to insist that public speakers, at least, should know what they talk about. Every intelligent stock raiser in this country, who takes a paper adapted to his business, knows that the designation of "Alderney," there being so few of the latter animals raised and imported, has been merged into that of "Jersey," and that the only two classes of Channel Islands cattle known to American breeders, are the Jersey and Guernsey, and these are so unlike each other that he who runs may distinguish them.

Mr. Hyde is no nearer the truth when he says that these cattle have been too closely bred, and are therefore too delicate and effeminate for the ordinary practical farmer, and that they are larger eaters than other cattle as compared with what they produce, the fact being that they are hardy and long-lived, will thrive upon pasture other stock would starve on, and are quickly injured if fed excessively, as most other stock are to produce the quantity of butter yielded by the Jersey or Guernsey. At the meeting at Greenfield, Mass., where these remarks were made, one day was set apart as a dairy day, and large prizes having been offered for various samples of butter, there were multitudes of competitors from the dairy districts and towns about, and it is a somewhat noticeable fact that the prize-winners were small farmers, owners of Jersey or grade Jersey cows, who made the butter in the old-fashioned way, setting the milk in shallow pans; but from the milking to the final packing the utmost cleanliness was observed.

Another point of importance was, that all the premiums were given to butter made during the end of November, showing that as good butter can be made in the winter by skillful hands as in the spring or fall, and that the complaint of the ordinary farmer that he cannot make it in winter, arises either from his ignorance or indolence—generally from both—and it was formerly no unusual reply of a New England farmer to the inquiry why he dried off his cows so long, that it was cold milking in the winter and the butter, if made, would not sell, as it was bitter. The Jerseys have been influential in remedying this state of things, as they were too costly not to be utilized as long as possible, and there is more difficulty in drying them off when it is necessary so to do, than other cows, and their butter, retaining its color—if they are properly fed—as well as its flavor, the consumers who have become accustomed to fresh butter when residing abroad, have made a demand for a similar article, and large quantities of the "gilt-edged" article are now sent to the cities from private dairies, and this with that from "creameries" must soon be the leading staple for the table of those who can afford and are willing to pay a remunerating price.

Therefore let us give the *Jerseys* their due; sink altogether the term *Alderney;* spell the *Holstein* with an n not an m; remember that they are really Dutch cattle; that Short-horns and Durhams are identical, and that the *Ayrshires* came from the same region that gave birth to Burns, and that just as he was an *Ayrshire* ploughman and his only AIMS are in his songs, they are *Ayrshire* cattle.

Lenox, Mass.

WINTERING CATTLE.

L. S. HARDIN.

PROTECTION of dumb beasts against inclement weather may be said to be the basis of farm improvement. Just in proportion to a man's care for the stock under his charge, can you measure his degree of progress toward the point of perfection that we should all struggle to attain? The higher types of thoroughbred cattle that reach these shores with such blood-like and elegant forms, are created almost solely by great care in protecting them through long lines of breeding, from the hardening and roughing effects of exposure. In this way we can readily see how much the English stock breeder is ahead of us in his system of handling cattle. We are, however, a people quick to imitate the practices of others when they strike us favorably. In this way we have produced copies of the English race-horse and fat cattle that have been able to stand the test of competition on the other side of the big waters. We thus see not only the importance of protecting stock, but it is evident we are abundantly able to do it when we set our heads in that direction.

By "wintering cattle" I mean not only feeding, but in some measure, at least, protecting them from inclement weather. At the Far West where cattle are handled on a grand scale, it seems impracticable to furnish any protection outside of a vigorous constitution and a thick hide, so that cattle there, so far as protection is concerned, may be said to winter themselves. As we come Eastward we find the herds smaller, and consequently better taken care of. In the dairy districts particularly there is something of a reform going on in the way of protecting cattle in winter. It was only the other day a dairyman was telling me of often, when a boy, having heard the creaking of the cows' feet on the cold snow at night, as they moved about the stable-yard, to keep up the circulation. He also said that many a frosty morning he has made the cows get up, that he might warm his bare feet where they had been lying. So it seems, in days gone by, the boys were not much better wintered than the cows. But even to this day in the best dairy districts it is simply amazing to see the utter neglect of shelter that is practiced by dairymen. The roughest shed will save, in the condition of the cows, a large percentage of feed, while full protection will allow the number of the herd to be added to fully one-fourth on a given quantity of feed.

In the matter of what constitutes perfect shelter, doctors disagree. I have seen the very best results in product of milk and health of cows, where the thermometer in the stable was never allowed to go below 60 degrees in the coldest weather, and the air in the stable was saturated with the smell of manure—there being a total absence of ventilation. This may not be the most profitable temperature for handling cows, but the dairymen who did so, made fortunes. There is one thing certain, however, in relation to the correct temperature of cow stables:—the air should never be allowed to fall below the freezing point, if a profit is expected from the milk yield. A cold cow is about as useful for making milk as a frozen pump.

Young stock require protection with a view to their future usefulness. If they are for beef, then the better the protection, the greater the profit from the returns. If they are intended for the dairy, a little hardening will not hurt them. "Roughing it" detracts from the fattening tendency, and thereby makes a more profitable milk producer. Feeding and watering are correlative principles with shelter; and in wintering animals they should be treated in respect to one of these practices as they are in the other. The ultimate purposes for which the beasts are intended should govern their treatment, for just as they are wintered will be their future development.

CIRCULAR AND BY-LAWS OF THE NATIONAL DAIRY CATTLE CLUB.

NEW YORK CITY, Dec. 26, 1879.
(Butter & Cheese Exchange) 309 Greenwich St.

DEAR SIR:—This Association has been organized for the sole purpose of measuring and recording the yields of dairy cows. It is an acknowledged fact that 25 per cent. of the cows in our best dairy districts are unprofitable. To remove this burden from the dairyman, the practice of handling cows must be reduced to a business basis. To accomplish this, owners must keep strict accounts, as all good business men do.

This Association presents a simple, clear and practical method by which the dairyman can measure the value of each cow—her daily production — so recorded that it will point unerringly to any change in the cow's yield—whether it comes from sickness, neglect or accident, bad quality of newly purchased food, unwise change of pasture, or other injurious practice that could not have been detected except by the great loss occasioned thereby.

A daily record, like a faithful sentinel, sounds the alarm at the approach of danger, and puts us on our guard against the hazards of serious loss.

We appeal to you to assist us in this good work by becoming a member of this Association, or at least sending us the records of your cows.

Respectfully,
L. S. HARDIN, SEC.

BY-LAWS.

For the purpose of carrying out the design of this organization, the Executive Committee pass the following by-laws:—

(1.) It is suggested to dairymen that, in general, cows to be profitable should yield as follows:—Cows over four years old should yield not less than 7 lbs. of butter a week, or 200 lbs. of butter a year, on 25 lbs. of milk a day, or 4,000 lbs of milk a year; a cow under four years of age should yield not less than 5 lbs. of butter a week, or 150 lbs. a year, on 18 lbs. of milk a day, or 3,000 lbs. a year.

(2.) It is deemed advisable to admit cows of any product to be registered under the following rules:—

Class A.—A continuous daily record of milk or butter, or of milk and butter, for 12 months.

Class B.—A periodical record of the product of three days in the first week of each month for a year, of milk or butter, or of milk and butter.

Class C.—The product for 7 days of milk or butter, or of milk and butter.

(3.) In all tests under classes B and C the cow must be milked dry within 12 hours preceding each term of trial.

(4.) Bulls may be put on record after their dams or daughters are recorded.

(5.) The fees for a single record shall be two dollars. Each additional record in the same herd, or a subsequent record of the same cow, shall be one dollar.

(6.) A discount on these terms of 25 per cent. shall be allowed to members.

(7.) One-half of the fees for recording shall go to the Secretary.

(8.) Persons keeping annual records are requested to make monthly reports to the Secretary for immediate publication—at his discretion.

(9.) All final reports must be made on blanks furnished by the Secretary.

(10.) State the whole yield in pounds and quarters of pounds.

(11.) All applications for record must be filled out by the applicant and subscribed and sworn or affirmed to before an officer of the law.

(12.) When the application is filed, a certificate of yield shall be returned to the applicant.

(13.) Should an application not be satisfactory to the Executive Committee, then such application shall not be recorded unless such steps are taken as in such case the Committee may deem advisable.

(14.) The Secretary, upon application, shall furnish all necessary blanks for recording yields.

Certificates of application and certificates of record on receipt of 25 cents.

Blank forms will be furnished on application to the Secretary.

The fee for membership is $3.

WE call special attention to the auction sale of Holstein cattle advertised elsewhere in this issue. Whether for milk, butter or cheese this fine breed is rapidly gaining a wide popularity in this country. Moreover, the great prepotency of the bulls, due to the purity of their blood, renders them valuable sires for improving our natives, and the aptitude of the cows to take on flesh readily, when turned off for the butcher, adds to their value as abundant yielders of milk.

Field Crops.

TILLERING OF THE WHEAT PLANT.

PROFESSOR LEVI STOCKBRIDGE.

THE wheat plant, like some others of its class, has the habit of developing underground stems from the base of its main upright stem. These are full of nodes or joints from which grow upright stems with true roots. This method of growth is called tillering and is a feature of great importance to the wheat grower, because it may result in very largely increasing the final yield. Instances have been recorded, where by tillering as many as fifty full heads have been produced from one seed, when but for it the product would have been a single one. It is a noticeable fact, that in different circumstances wheat tillers very unequally, and apparently without law. The same development is not made in different years by the same variety of wheat, or in the same year in different circumstances of soil, exposure and plant food. Yet careful observation has led to the quite general belief that this development is materially influenced by three causes which are worthy of note.

The first is the depth at which the seed is planted. A vigorous plant with much vitality and in rapid growth, tillers more than a feeble and slow grower. If, now, the seed is planted so deep as to be in cold soil and excluded from aerial influence, it germinates slowly; in other words, it decomposes slowly. The young plant is poorly fed and expends all its power of development in struggles to reach its normal position in the air and sun-light. In such a case, the plant will be deficient in layers beneath the surface from which other aerial stems may be produced. The same result may follow too shallow planting, from the same cause. A position near the surface in a comparatively dry soil, makes decomposition slow and a plant feeble, the same as deep planting. Wheat seed should be covered in the surface soil, and, other things being equal, it will tiller the more the nearer the sur-

face, provided it lies in soil constantly moist. The proper depth to obtain the most favorable conditions, is between one-half inch on heavy, moist loams and clays, and two and one-half on dry, sandy loams.

Plants, like animals, have their periods of infancy, youth, maturity and old age. The perfection of the two last, depends materially on the developing influences of the first two. A hot-bed growth which crowds the plant through all these periods with unnatural activity, is not favorable for the best development in either of these, and lessens the result sought in large returns. Tillering is effected in the period of infancy and youth. The shorter this period and the more unfavorable its attendant circumstances, the less the development. This is illustrated in the growth of spring wheat sown from the 20th of April to the 10th of May; after the copious rains of spring have passed, the clear, warm sun-light, and comparatively dry soil of June hurry it rapidly to the July harvest. It tillers very little; it has no time, and produces but few more stalks bearing heads than the number of seed grains sown. Therefore we sow a bushel more of spring than of winter wheat to the acre; and of winter we sow more the middle of November than the first of October. Those circumstances of abundant moisture, cool but not cold weather, which give the time and power for wheat to tiller freely, exist in the fall months. The wheat grower, therefore, if he would avail himself of this habit of the plant, should sow this grain about the first of September in middle New England, while in the southern part of the Middle States the same result might be reached if it was sown three or four weeks later.

The next cause of abundant tillering is food. Good cattle are the result of good and abundant food *judiciously* supplied, and that continuously through all the period of their development. It is exactly so with wheat. There may be over-feeding which will amount to unnatural growth and injury in both cases. Stuffing and starvation should both be avoided and the best food for the young calf and the young plant, may not be the best for the ox or the plant in an advanced state of growth. Tillering takes place in the infancy and youth of the plant, and if at that time, its short and not fully developed roots are surrounded by an abundance of actual food, which can be taken up by simple absorption, their complete development does not occur, tillering is deficient, the plant is over-fed and hastened on to unnatural maturity, at which time its root power is not sufficient for its perfection. The young plant to tiller well, should be well, but not over-fed and stimulated to a too rapid growth. Yard manures and composts which have passed through their *active* stage of decomposition, but in which that change will yet go slowly on for weeks and months, will produce the result we seek, and carry the work on to completion. The same result may be produced by more active chemical elements; but in this case the manures should be intimately mingled with the soil a sufficient time before sowing the seed, to have their intense activity modified by action on the soil itself.

LUCERNE HARDY IN CANADA.

The following is a letter sent to us by a friend in answer to our inquiries. He resides at St. Lambert's opposite Montreal:—

In reply to your inquiry about Lucerne, I have to say that I have about three acres of it, which I have cut over for three years past. The soil is light and deep upon a clayey base; the land slopes in two directions and *no water* can stay upon it. I cleaned it well with root crops two years previously. I sowed the land in the spring broadcast, of course, after fall plowing and thorough harrowing. In a month I was disappointed and disgusted with a crop of weeds. Being busy with other work, I let them grow some time longer. When, however, we mowed the weeds the Lucerne was up about six inches. We happened to have summer showers and it started up immediately and in another month we had a fair crop of it. I cut it a second time, the weeds having been killed out. We cut last year and this on the 1st day of June and of the following July, August and September. After having obtained four crops each season, feeding four horses and two bulls (one feed of hay per day for the animals), I am quite satisfied with it. The roots have gone down over two feet. I gave it a top-dressing of plaster this year, but do not think it did much good. I intend to top-dress it with a compost of barnyard manure and earth from ditch cleaning. I should prefer well rotted manure if I had enough of it.

We had fine crops this year. One month we had no wetting rain whatever, yet the Lucerne was undiminished and gave us a good cut. In starting this crop, look out for water; some of my furrows were not well made, and in the spring retained the water which killed the Lucerne in those spots. I can improve in my next attempt by working the land more carefully. They say it will last twenty years with careful top-dressing, so that it is worth the labor needed to prepare the ground well. I have much better soil on my farm, but I chose the present spot on account of its sloping and offering no place for the water to stand. I am told that it does well seeded down with barley. This knoll of land does not keep the snow and is, of course, not well protected during the winter; in fact, it is one of the most exposed places on my farm. If I had read some of the books, I would not, perhaps, have chosen this spot. *None* of the roots have been winter-killed, so that it has proved hardy so far.

MATURITY OF THE COW PEA.—J. A. F. writes us from Terre Haute, Ind., that the Cow Pea has been grown there, in latitude 39° 30', in a small way for many years, fully maturing its seed. Indeed, so far as he knows, it has been grown for its seed alone, to be used as food in winter. He has known and heard of its being grown there for 20 years. The Crowder and Lady Pea are those mainly grown there, and they are esteemed by some for table use.

Farm Topics.

THE TRUTH ABOUT IT.

[THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

THE TRUTH ABOUT SORREL.

T. H. HOSKINS, M. D.

Col. Curtis is quite correct, as far as he goes, in what he says (p. 803) about the use of lime to prevent the growth of sorrel. But he is singularly incorrect in saying that "Men of science sometimes tell us that sorrel is an effort of nature to get rid of the acid in the soil, and as a remedy for the acid condition of the soil, and to get rid of the sorrel they recommend the free use of lime to sweeten the ground, thus by removing the cause, to cure the evil." I am astonished that the intelligent Colonel should say this, and I think it would puzzle him "awfully" to produce the first line or word from the writings of any man having any title to be called a "man of science," in proof of his hasty allegation. "The truth about it is *that this belief is a popular error*, against which not only men of science, but many practical farmers, have been contending for years. The conclusion that the acid of sorrel comes from the acids which exist in sour soils, is one of those hasty generalizations, the apparent plausibility of which is very attractive to people with no scientific training. But even a tyro in science knows that the acids of acid plants and fruits come ,not from the soil, but from the atmosphere; while the observing, practical farmer refuses to swallow the theory because he has frequently observed sorrel to grow luxuriantly alongside of a lime-kiln, or by the side of a pile of ashes, and has also noticed that sorrel is hardly ever seen in any abundance upon sour soils, while it thrives and grows abundantly on the very sweetest lands, when other and stronger plants are prevented from choking it out.

Nevertheless, we sometimes find in practice that in a field dressed with lime or with ashes, the sorrel will disappear, and that a heavy growth of grass and clover takes its place. Such occurrences are often quoted by those who hold to the "sour-soil" theory, regardless of the fact that such an event *never happens in a really sour soil*. The explanation of such a change, when produced by the use of lime and ashes, is very simple indeed. We find sorrel takes possession of our mowings under two conditions:—First, the clover or grass may be winter-killed, in which case the minute plants of sorrel (which are to be found all through and among the grass in all mowings on light soils) rapidly grow and multiply from their innumerable branching roots, and in a very few weeks entirely fill the ground, so that where, the preceding year, hardly a spear of sorrel would have been apparent in the thick growth of larger plants, we now find, early in June, a crop which seems, by the prevailing redness, to be all sorrel. The second condition under which sorrel takes the lead is where the soil has become exhausted by continued pasturage, or by successive mowings without any fertilizing application. Here the weaker sorrel gradually gets the upper hand as the stronger plants perish, or become weak for lack of sustenance.

Now, in either of these cases, if we dress liberally with lime or ashes, the weakened grasses and clovers may start up with renewed strength and overgrow the sorrel, thus reducing it to its normal state of subjection on all fertile soils that are seeded with anything better. If the alkaline application fails to give the grasses superiority over the sorrel, it is because something more (probably nitrogen) is needed. In such cases a top-dressing of good, fine stable manure will restore the sod, *provided the seeds or roots are there to make one.*

Orleans Co., Vt.

Miscellaneous.

TOMATOES.—In this latitude (34° N.) tomatoes come into general bearing by the 1st of July, and by August they rapidly deteriorate, being no longer good for salad, and calling for much sugar in cooking. For autumn use in cooking and for catsup, we have always resorted to the volunteer tomato, which is spherical and about the size of a Chickasaw plum. With reference to the Acme, we noticed, as have many others in your columns, that the first, earliest fruit was curiously defective in a ring of the size of a dime at the "flower end." After the first week of ripening this defect entirely disappeared; the fruit was abundant, beautiful and maintained its *superiority* of quality up to our first frost, on the 3d of November. They were never bitter, and continued to make good salad to the last. Henceforth we abandon all other sorts until a better one appears. In cultivation we give abundant space, two feet apart, in the row. We take our pea brush, which is then ready for removal, and stick it in two rows on either side of the tomato row, with tops inclining inwards. When the tomatoes get above the brush, we clip with a sickle, giving the row the uniformly rounded top of a hedge, which we maintain by subsequent clippings during the season. It makes an ornamental hedge, giving abundance of delicious fruit. The vines are frequently relieved from ripened and defective fruit, and any excess is taken to the poultry yard, to the great comfort and benefit of its voracious denizens. C. W. S.

AN EXCELLENT EXAMPLE.—Our friend, W. C. H., of Walden, Orange Co., N. Y., having sent in a number of subscriptions, refers to one of them as follows:—"This address is that of a boy sixteen years of age, who has been employed by me during the last eight months, and who, during that time, has taken such a great interest in the RURAL, and, consequently, so much the greater interest in my work, that I have decided to present him with the paper for the ensuing year. His wages have been paid to his father, and his portion for his summer work is represented by a pair of skates. To-day I offered him a present of $2 or a year's subscription to the RURAL. He did not hesitate in his choice for a moment, but thanked me for the gift, and said he thought the paper would do him the most good. Wise boy! Every week he has had the privilege of reading my copy, and I have been surprised at the large and useful fund of information he has gleaned from its rich columns. Although I have made it a practice to have my RURALS bound, I have found that by letting my work boys read them, they take a much greater interest in the work, and my papers are but little injured."

WHAT OTHERS SAY.

CATALPA SPECIOSA.—Professor C. S. Sargent, of Cambridge writes to the London Gardeners' Chronicle as follows: "Permit me to correct an error which appears in the account of Catalpa speciosa in your issue of Nov. 1. The fact that there are two species, or two very distinct forms, of North American Catalpa was first noticed and made known many years ago by Dr. J. A. Warder, of Ohio, to whom, and to Mr. E. E. Barney, of Ohio, is due the credit of having brought the very remarkable economic properties of this tree to public attention, my own connection with the matter having been entirely subordinate to theirs. I take this occasion to call the attention of European planters to Catalpa speciosa. It is in every way a far finer, and a more rapid-growing tree than Catalpa bignonioides, and should it succeed in Europe, as from its geographical range in this country I am led to believe that it will, it will prove a most valuable addition to the list of your ornamental and timber-producing trees."

PLANTING THE BRANCHES OF APPLE TREES.—Henry S. Young, of England, says that a neighboring farmer, some six years since, planted two branches of an apple tree, one the size of an ordinary walking-stick, the other four times the size; both were planted in a garden, about six inches deep, and both bore fruit the following year. They bear well now, look healthy and vigorous, and bid fair to do so for many years to come. These branches were cut with a cross piece at the bottom; they were not pruned, and were planted the middle of December.

WHY COMPLAIN?—America gets our cash, only because we want her grub. It is idle to complain because we have to pay for what, this year, we sorely want, and to snarl because we cannot tax those who are saving us from famine. This is the truth of the position. The foreign growers whom men are so anxious to tax, are the one assistant force which is staving off riot, disease and death from our crowded towns.—Ag. Gazette (Eng.)

DISEASED MEAT.—Dr. Carpenter says that animals fall an easy prey to every kind of epidemic; for all sanitary laws are, as a rule, ignored by farmers. He was not surprised when an inspector from the Metropolitan Meat Market declared upon oath in the Croydon Police Court that 80 per cent. of the meat which was sent to the London market was the subject of tubercular disease; and that to exclude diseased meat from the market would be to leave the metropolis without an adequate meat supply.

POSSIBILITIES OF AN ACRE.—Waldo says in the Ohio Farmer that he remembers one year making a very large profit from an acre of land, managed in this way: He first grew a crop of Tom Thumb peas, which matured in time for cucumbers, for pickles, and then he grew 500 bushels of turnips, sowed broadcast among the cucumbers. He found that these crops will mature without crowding each other, if properly managed.

POLLED ANGUS.—The Earl of Airlie, writing to the North British Agriculturist, under date December 26, 1878, says:—"I have at present seventeen pure Polled Angus milch cows in my dairy. The greater number of these give from 12 to 14, and sometimes 16 Scotch pints for a considerable time after calving. The milk is admitted to be much richer than that of either the Short-horn or the Ayrshire."

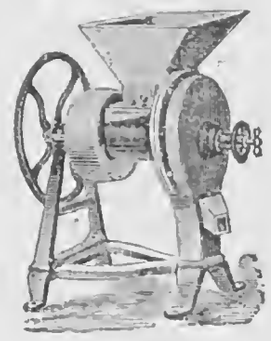
COLOR IN BUTTER.—The Channel Islands breeds almost invariably possess the faculty of conveying a yellow hue to the butter. This gift is personal. Some cows of all breeds have it when in full milk, but the Channel Islands breeds have it in the greatest measure, and retain it for the longest period after calving.—Dairy Farmer.

SCOTCH POLLED CATTLE.—Mr. W. B. Allen says that the black Scotch Polled, though admirably suited for breeding bullocks on the ranches of our Western plains, cannot be made generally popular among Eastern farmers, on account of their color and usual deficiency for the dairy.

Industrial Implements.

The Victory Corn Mill.

THIS efficient mill for grinding corn, corn and cob, oats, barley and all other grains for feeding stock, as well as bones, shells and charcoal, weighs 400 pounds, costs $45, and is manufactured by Thos. Roberts, Springfield, Ohio. Of the advantages of grinding feed for stock we have spoken so often that it would be superfluous to repeat them here. All these advantages can be secured by the use of this mill. Every part of it is duplicated, so that any broken piece can be readily replaced at a



trifling expense. If the corn is quite dry, it is claimed for it that it will grind 20 bushels per hour. Of course, if the corn is damp, it will grind more slowly. Shelled corn it grinds fine enough for family use, and by reversing the motion it sharpens itself. The crushing of the corn and cob is effected before going to the burr by means of a heavy cast-iron screw, revolving in a cast-iron chamber just under the hopper. The operation of the screw is such that it feeds the crushed mass along continually to the burrs, where it is ground coarse or fine, as may be desired. The fineness is regulated by a feed-screw, seen in front of the mill. It can be operated with any kind of power where a belt can be used. It will grind with a four-horse power, but if it is desired to run it to its full capacity, eight-horse power is required. Full information with regard to it will be promptly furnished on application to the manufacturers at the above address.

THE OPTIMUS RETURN BUTTER PAILS, manufactured by James B. Gilberds, Jamestown, N. Y., and favorably noticed in our last issue, bore away the first premium in articles of that kind at the late International Dairy Show. The same enterprising manufacturer took first premium for butter firkins also. These goods are strongly made and are deservedly gaining a large sale and wide popularity.

Everywhere.

COLORADO CORRESPONDENCE.

Much has been said of the mines and mineral wealth of this Centennial State, but little, so far, of her agriculture and population. Immigration has become simply immense — over 100,000, it is stated, having come here since last January. Our climate, soil and agricultural resources, as well as mining, have attracted them. Leadville, since January, has risen from a few hundred inhabitants to nearly 25,000; Denver, from 20,000 to over 30,000, and still she is rapidly enlarging her borders. Every little town is growing apace, and even the cattle, sheep and chicken ranches are full of people, and still they come to invest in any and every kind of speculation; some for health, some for pleasure, while the greater part come to make money and seek a fortune. Every available spot where water can be obtained, is being taken up at extravagantly high prices, and intelligent and skilled labor is in great demand. This "Great American Desert" is "booming"—minerally, sanitarily and agriculturally. People from every State are here, and thousands from foreign countries. John Chinaman graces every nook and corner of the cities and towns. His wash-tub notoriety makes him independent. He has plenty of money—but not to spend. He always rents and never buys. He greets you with his tapering eyes in front and his plaited switch behind, clad as to his feet with wooden shoes, and, as to his person, with the full, flowing and short celestial robe of blue. He walks the streets and adorns the theater as if he had us in his power. He is never seen on the farm; nor could he become a farmer if he would, from the fact, it is said, that he "reverses everything with which he works." He hitches his team to the plow handle, he takes the hoe by the blade, he drives a nail with the edge and cuts with the hammer of the hatchet, and I suppose he would walk on his head if he could make a dime without spending any of it.

The Utes are a failure—not in lying, but in their anticipated success in brow-beating the Colorado Governor and his people. This will not be their greatest failure. Every chief but Ouray has become a notorious outlaw. Turning State's evidence won't save them.

Fort Collins, Colorado. * * *

RURAL SPECIAL REPORTS.

Arkansas, Greenwood, Sebastian Co., Dec. 12.—Very pleasant weather; no snow; a few frosts. Farmers busy and happy. Cotton, 11c.; corn, 75c. in the car, and prices improving. Oats, none in market. Wheat, $1.25@1.50, and very scarce. Sweet potatoes, 50@60c.; Irish do., $1.25@1.50 per bushel, and very scarce. Farmers here do not know how to keep them. Eggs, 16⅔c.; live hogs, 3½c.; bacon, 5c.; hams, 8@10c.; flour, $4; shorts and meal, $1.50 per 100 pounds. R. R.

Canada, Fern Hill, Ont., Dec. 12.—Crops here turned out better than was expected in the early part of summer. Fall wheat was very good; but the spring sort was a miserable failure, some hardly getting back what they sowed. The midge was the principal cause of the mishap. Oats were a very fine crop. Of peas there was very little sowed. Corn, which was planted instead, proved a "middling good" crop. My Blount's corn did extra well. Some of it grew to the hight of 14 feet, and had from three to nine ears to the stalk, and it all ripened finely. It was planted 3½ feet each way on sod soil. Defiance wheat did much better than I expected of the shriveled seed. Hay hereabouts was a very fair crop, and so were late-planted potatoes. The Beauty of Hebron ripened here before the Early Rose. Fruits of all kinds are quite plentiful. Fall-sown wheat looks fine. That sown first has begun to lodge, and some farmers have turned in their stock to graze it. A great area has been sowed to wheat here this fall. The weather is very disagreeable at present; cold, like winter, some days, and as warm as in summer on others. J. M. W.

England, London, Dec. 9.—So far we have had the most severe winter we have ever had—really hard and continuous frost at the end of November and early in December, which is quite a novelty for us. W. R.

Iowa, Eldorado, Hardin Co., Dec. 11.—We have a splendid corn country, considering that we are in north latitude 42°. Our yield is from 40 to 80 bushels per acre, without manuring; oats about the same; wheat (spring) averages about 15 bushels. Not much fall wheat is raised here. Wheat now brings $1; corn, 25c.; oats, 25c.; potatoes, 30c.; hogs, 3½ to 4½c. per lb. gross; butter, 20c.; eggs, 15c. per doz. E. M.

Mo., Bucklin, Linn. Co., Dec. 10.—Autumn has given us more rain than usual, I think. We had five or six light thunder showers in November. Fall grain looks well. Of the Rural seeds we like the "Golden Rural" tomato very well. Though not as sweet as the Canada Victor, its flesh is peculiarly delicate in its texture, it is very handsome and bears well. The "Beauty of Hebron" potato did first-rate, and is destined, I believe, to supplant the Early Rose. The Rural Cricket ticks merrily on the wall, and says it is time to retire. Mrs. F. M. B.

Mich., South Haven, Dec, 18th.—Our autumn was unusually wet, with a heavy fall of snow in November, followed by a warm, rainy week or two, since which we have snow again, three or four inches deep, and the range of the thermometer from the freezing point to about 14°. No ice yet forming in Lake Michigan. T. T. L.

Ohio, Ripleyville, Huron Co., Dec. 16.—We have had a very fine fall for farming. Winter is now just setting in with snow two inches deep for the first time. Wheat never looked better at this season. We had an extra-good crop last harvest; on some places it went as high as 51½ bushels per acre. Corn was a poor crop with some exceptions. Oats were about middling. Potatoes good. Apples very scarce. Hay a very light crop. Wheat is now bringing $1.30; corn, 50c.; oats, 25c.; clover seed, $5.50; hogs, live weight, $4; butter, 25c.; eggs, 20c. J. K. R.

Rhode Island, Providence, Dec. 24.—You ask subscribers to tell you which part of the paper they like best. Naturally, being in the florist and nursery business, I like best the parts referring to that subject. I am also very much pleased with the seeds, as most of them have done well with me. We have plum trees set in our hen yards and they fruit well. E. T. D.

Texas, Dayton, Dec. 10.—Our crops are all gathered, and both corn and cotton were light, owing to the drought. Cotton has gone forward in fine order, for there has been no rain to speak of in six months. Thirteen days ago, I pulled three large-sized Voorhis watermelons, being the second growth. They were planted on the bank of the Trinity River in a bed of sand. I doubt if any of your subscribers can say as much, and I can assure you they were a rich treat. G. G.

The Querist.

ANSWERS TO CORRESPONDENTS.

Another Grape Swindle. (?)

A Subscriber, Norfolk, Va., asks our opinion of the following varieties of grapes:—Eva, Butler, Imperial, Moore's, Highland, Montgomery, Challenge, Wyoming, Monroe, Janesville, Rubies, Duchess. They were sold in that section last spring by an agent of a J. H. Hutchinson, "M. D.," of Geneva, N. Y. It was claimed for them that they were superior to any other Grape grown. The agent sold them at $16 a dozen, "to introduce them," asserting that the retail price was $60. Our correspondent seems to have some doubts as to the superlative merits of the Grapes, and even appears disposed to think that the claims put forward on their behalf might be somewhat fraudulent, and sends us a copy of the circular in which they are plastered with praise.

Ans.—The circular sets forth that the proprietors are introducing the "Medicine Grape of Europe, hybridized with our Iron clads of America;" that Prof. D. W. Jones, of the Department of Agriculture, says:—"We can cordially recommend them to all lovers of good fruit, and shall look with interest upon their general introduction to this country;" that Dr. Hutchinson, of Geneva, has analyzed 'those 12 hybrid grapes; that Dr. Bell is introducing and finds them to consist largely of citric, malic and tartaric acids and iron.'" Then the circular goes on to tell how tartaric acid is the name applied to the active principle of "those Hybrid grapes, producing a slightly stimulating or tonic effect upon the quickened system," and more bosh of the same sort that need not be reprinted. We have never heard of several of the Grapes above named. The claim that they are superior to any other Grapes grown, is false upon the face of it. The statement that the price is $60 per dozen at retail is also false. There is no such Grape as the "Medicine Grape" of Europe. The analysis of the grapes by Dr. Hutchinson is absurd. Of those named, Moore's (by which, perhaps, Moore's Early is meant), Imperial, Highland and Duchess are comparatively new sorts—good so far as tried, but not yet sufficiently tested to justify any broad assertions as to their value. We have never before heard of "Professor" D. W. Jones, Dr. J. H. Hutchinson, or Dr. W. R. Bell, all of whom seem to be connected in one way or another with this rather dubious transaction. By the way, we have had quite a large number of inquiries the past year as to the trustworthiness of various "nursery" firms hailing from Geneva, N. Y., and have seldom been able to answer reassuringly on the subject, although there are several excellent nurseries there.

Horse Queries.

W. E. A. S., Cincinnatti, O., has a five-year-old mare that can trot fast when urged on by whip or voice, but which, when these stimulants cease, quickly drops into a spiritless jog-trot, and he asks whether anything can be done to give her spirit and a good brisk gait. He also inquires whether weighed shoes increase the speed of a horse.

Ans.—Horses differ greatly in temperament. Some are dull, lethargic, even stupid, but these are very safe drivers. Others are nervous, high-strung, uncertain and restless; such are never safe except when a strong hand holds them. To change one kind to another is as impossible as to change a meek, patient, quiet stolid-tempered man, into a fiery, hasty-tempered, quarrelsome one. It is the nature of the animal, and whipping will only tend to render it still more stupid. "You cannot make a silk purse out of a sow's ear." This adage applies to the case in point. Weighted shoes, or foot weights, will tend to increase the stride of a high-actioned, and speedy horse, but will have a contrary effect on a dull, slow one. The weight having impetus given to it by the quick picking up of the foot, helps to carry the foot beyond the natural length of the stride. But a slow motion is made only slower by a weight.

Feed for Young Colt and Calf,

J. H. B. Belcher, N. Y., asks, 1, what kind of grain should be fed to a young colt to produce the best effect in bone and muscle, without fattening him; 2, would the same feed do for a calf seven or eight months old, and how much would it require.

Ans.—1. Our correspondent will find an answer to his first query in the article published on page 821, in our issue for Dec. 20. And in addition to the rations there given, if more cheaply obtained, he may substitute fine middlings for the oats, or if convenient to a mill, may grind two bushels of oats with one of corn, and give two quarts of this with one pint of linseed oil-meal. The oil-meal will keep the colt's stomach in as fine condition as grass. Corn is too heating to be fed, except in very small quantity or with other muscle-forming food. 2. The same food will be good for the calf, and especially if a male to breed from, or a heifer which is to be a breeder; and if the calf is to be grown for beef the same ration is best until its frame is grown, when corn may be added to put on the fat. With nice, early-cut clover hay, the grain ration may be reduced. The calf eight months old should make an excellent growth on four quarts of fine middlings and one quart of oil-meal per day, or three quarts of oats and corn, ground as above, with hay.

Indigestion in a Horse.

R. S. T., Shunpike, N. Y., has a horse out of condition that scours very badly on driving him five or six miles at a moderate gait. His feed is hay and oats. His coat looks rough and his legs swell while standing in the stable. The swelling, however, abates on driving him, but he doesn't grind his food as he should, and our friend asks what ails him and a remedy.

Ans.—Indigestion is the trouble. He may be too old to grind his feed well, and so swallows it whole, or maybe he eats it too fast, if he is not too old. Feeding meal would remedy the troubles. If the hay were cut fine and fed with the meal, he would probably do better. Doses of Glauber salts, two ounces daily, would give tone to the stomach and purify the blood. It is not uncommon for horses' legs to swell when standing in the stable. A tablespoonful of ginger would be good fed daily with the meal.

The Kieffer Pear.

H. E. P., Deposit, N. Y.; J. C., Akron, Ohio; E. D. H., Detroit, Mich, make inquiries as to the likelihood that the Kieffer Hybrid Seedling Pear will prove thrifty and profitable in their respective localities, and for more information with regard to it than was given in the Rural of Nov. 22.

Ans.—All the information we possess was given in the Rural which presented the portrait of the Kieffer Pear. We do not believe that our correspondents can ascertain whether it will "do well" with them, except by trial. We try to be foremost in informing our readers as to all new fruits, grains and plants; but we advise caution in trying them. It is now too late to transplant. The pear will be advertised in all rural papers before planting time in the spring.

Arboricultural Information Wanted.

O. W. F., Blackstone, Mass., asks for the experience of any Rural reader who has ever grafted or budded the Shag-bark Walnut on the common Pig Walnut, so-called in New England. He wants to know how it is done; the proper time for doing it; when to cut the graft or bud, and how the wax is made.

Miscellaneous.

M. L. B., Princeville (either in Ill. or Kan.), wants to know what is to be done with Blount's corn to obtain the book premiums offered by the Farmers' Publishing Co.; to whom and when shall the full proceedings be reported?

Ans.—The six book prizes offered by the Farmers' Publishing Co. are for the six heaviest yields of corn raised from the quantity sent out by the Rural, the corn to be weighed three months after date of harvesting. For the number and kind of books in each prize, see the issue of April 26th or the Querist of Nov. 15th. The reports should be sent to this office, and are to contain only the weight of the corn, properly certified to by some public officer.

G. G., Dayton Texas, has two orange trees twelve years old, and he wishes to transplant them. They have never borne any fruit. Is it best to move them *now* or in the spring? Of course, the ground is open all winter.

Ans.—There will be nothing gained by waiting till spring. If convenient otherwise, they can be transplanted now. Transplanting in the North is done in the fall and spring only because the ground is either too frozen or too wet during the winter to do the work well.

E. T., Penville, Ind., asks if the June Berry will do well in Central Indiana, and where it can be had.

Ans.—The June Berry, a variety of which (Amelanchier alnifolia) we illustrated in the Rural of July 19th, will do well in Central Indiana; indeed it grows wild in many localities in the West as well as in the East and North. It can be had in almost any well-stocked nursery, and any enterprising nurseryman will be able to supply it, though he should happen not to have it in his stock.

G. C., New Haven, Conn., has a bed of fine muck from three to fifteen feet deep on his farm. It is free from grit and seems composed of decayed leaves and vegetable matter, and he asks what value has it as compared with manure from cows fed on hay, and what should be added to it to make it equal to such manure?

Ans.—Such muck is about equal to poor cow manure, or such as would be made from hay alone. It would be made more immediately useful in the soil if composted with a bushel of lime to each wagon-load of the muck.

A. D. P., Union Springs, N. Y.; D. T., Youngstown, O., et al, inquire as to terms, &c., of Prof. Meehan's work, "The Native Flowers and Ferns of the U. S." We have given these particulars more than once and refer our inquirers to the publishers for further information—the American Natural History Publishing Co., Philadelphia, Penn.

Finis, Oshkosh, Wis., describes a plant and asks its name. He also wants to learn how to destroy the red spider.

Ans.—1, it is Eryngium Leavenworthii—a hardy annual of great showiness, if rightly cultivated; 2, wash the leaves with a solution of whale-oil or carbolic soap or tobacco. Try acetic ether.

J. B. G., Columbia, Pa., asks where the Duchess Grape, an engraving of which was given in the Rural of Dec. 6, can be purchased.

Ans.—Of J. T. Lovett, Little Silver, New Jersey.

S. C. C. F., North Carver, Md., asks what does J S. Woodward, in Rural of Dec. 3d, mean by the "light coat" of salt, wood-ashes and bone-dust he says he gives his pear trees—how much of each constitutes a light coat?

Ans.—Will Mr. W. please answer.

Many readers ask where they can get cow-pea seed. We cannot tell them at present.

Communications received for the week ending Saturday, Dec. 27.

THE FREE SEED DISTRIBUTION.

A LETTER FROM "CLINTON."

One of the agreeable features connected with patronizing the publication of the Rural New-Yorker is the privilege of participating in the benefits of its free distributions of new and rare seeds. One whose attention is directed towards the pursuit of agriculture or horticulture as a means of profit, cannot fail to appreciate the value of the introduction of new varieties of plants calculated to meet his wants. It cannot be expected that every variety of the seeds thus gratuitously furnished from the Rural office will be found to be adapted to every locality or soil, or to meet the wants of every individual. But it cannot be known, with any certainty, to what particular climate or soil any plant is *best* adapted till it has been fairly tested; therefore there need be no grumbling or feeling of dissatisfaction if, for instance, Blount's Prolific corn is generally found to be a failure in latitudes as far north as Central New York. We

had no guarantee or assurance that it would succeed in any such locality. But it had been highly recommended as an improved variety, and we were kindly furnished with an opportunity to test its value for our own use, without any expense to ourselves other than the trifling trouble of planting and cultivation. And yet, in looking over the several reports of those who have been thus favored, it has really seemed to me that some of them indulged a sort of feeling that they had been almost *imposed* upon by being persuaded to make the trial, when the simple announcement of the fact whether the corn would or would not succeed in their locality, and if not *why*, would seem to be all that it was necessary to report, that such report might be beneficial to others.

Neither the Golden Rural nor the Acme tomato may suit every one, but, at the same time, many may be highly pleased and duly grateful that they have been introduced to their notice, and another advantage of that introduction may be in stimulating others to efforts in the production of other improved varieties, so that eventually the tastes and wishes of a larger number of the lovers of this valuable vegetable or *fruit* may be gratified. Many of my age can well recollect when the tomato was first introduced to our tables as an article of food. We have also witnessed, with much satisfaction, the great improvement that has been made by the introduction of new varieties, not only in form and flavor, but in the time of ripening.

For one, I confess to a weakness (if you choose so to term it) for testing new varieties of seeds and plants, and have frequently succeeded, very much to my own satisfaction, where others failed. I am now anxiously waiting for an opportunity to test the seeds which the RURAL so kindly promises to furnish to its subscribers for the coming year.

These remarks remind me to speak of the flower seeds distributed from the RURAL office by its present managers. I have been pained, I might almost say *disgusted*, at times in reading the reports made by several of the recipients. Too many of them read like these, for instance: "The flower seeds you sent me proved an entire failure;" or, "Only one or two of the flower seeds ever made their appearance;" or, "The season was so dry that the flowers were a failure;" or, "The flower seeds were neglected till it was too late for them to succeed;" etc., indicating clearly, to my mind, that the fault was with the recipients, and not in the seeds. I can truly say that, with the many seeds received from the RURAL office at various times, I have been quite successful—more so, I have thought, than with those purchased of the dealers. Possibly I have been more careful with them, in view of the source from which they came. At all events, I can vouch for the genuineness of the seeds furnished, and if, in any case, I have failed of success, I am frank enough to attribute the failure to my own ignorance of the correct manner of treatment, or to some accidental cause. I would, therefore, respectfully suggest to the recipients of flower seeds from the RURAL office, if they have no taste for their cultivation or no time to devote to their proper care and attention, that they kindly hand them over to some friend or neighbor, who they are sure will give them a fair trial, at the same time informing him of the source from which the seeds came, and the manner of distribution. In so doing they will not only give pleasure to the individual, but may aid in gaining a new subscriber for the RURAL. I am certain I have induced more than one to subscribe by calling attention to this free seed distribution to subscribers, and, in some cases, giving them a portion of my seeds for trial.

Although the taste for the cultivation of flowers has been so largely improved within my recollection, and has now become quite popular, yet it is surprising to see how many there are who *profess* to have a taste in that direction, while in fact it is evidently a mere pretense made for the purpose of being supposed to be on the popular side. I have always given freely of seeds or plants to those who desired them, even to my own inconvenience many a time, as I take pleasure in encouraging their cultivation. But I have been surprised to notice how many there are, even at this day, who, on being inquired of afterward as to their success with them, have confessed either that they forgot to plant them, or that the weeds had choked them, or even that they had not looked at them since they were planted. With all such persons, my confidence in their professed love for the cultivation of plants or flowers is very much weakened, to say the least of it.

I fully indorse what has recently been said in the RURAL, under the head of "Miniature Hot-Beds" and "Floriculture for Young People," etc. After the plain and simple instructions there given, no amateur cultivator, who has ever read them, if possessed of a modicum of common sense, will hereafter be warranted in reporting that the seeds gratuitously furnished from the RURAL office "all failed to germinate."

The Poultry Yard.

PREPARING POULTRY FOR MARKET.

FORREST K. MORELAND.

BUTCHERING on the farm is no small task. The work itself, when once fairly commenced, is not so difficult, but it is an unusual task and one that is dreaded to some extent. Killing and dressing poultry are a task that usually falls to the lot of the women.

It is the practice on many farms to get ready for killing, get some assistance and butcher the hogs, and, perhaps, one or two beeves at the same time. The occasion is usually taken advantage of by the women folks to kill and dress all the turkeys, geese, ducks and chickens, and get rid of everything of this sort at once. There is a show of reason for this plan. Butchering, at best, is a very disagreeable matter, and by attending to it all in one day, there is much less trouble and annoyance. When the poultry is all killed at once, it must be marketed at the same time; and, of course, it is sold for shipment or to some dealer to be retailed. In either case, a somewhat lower price must be accepted than if sold in another manner, if, indeed, the farmer should not be so unfortunate as to strike a glutted market. Another method of disposing of poultry, and one which I have followed for years and have found to be uniformly profitable, is to procure a number of good customers who will take a certain quantity of poultry regularly until the entire stock is disposed of. Those who wish to sell their poultry in this manner will find it indispensable to success to observe a little care in fattening their fowls and preparing them for market. It will not do to sell old hens for spring chickens, nor will it do to stuff their crops after they are dressed or to send to market carelessly-dressed poultry. When care is taken to have a good article neatly dressed, fully twice as much can be realized from it, if retailed in the manner I have suggested, than if sold to commission men or retail dealers. I have found it well worth the extra trouble.

Fowls should not have access to feed for from 12 to 18 hours before killing. This may be accomplished by putting the fowls to be killed in an inclosure by themselves for that length of time. No more fowls should be killed at once than can be dressed before they get too cold. They are much more easily picked while warm. There are different methods of killing fowls—good, bad and indifferent. One method, much practiced, is to have a suitable block of wood in some convenient place; grasp the fowl firmly by the legs with one hand, and with a sharp axe—sometimes a dull one—sever the head from its body at a single blow—if two or more are not required. When this is accomplished, the fowl is left to thrash around on the ground, getting its feathers all besmeared with blood and dirt. This is the bad method of killing poultry. There are a great many indifferent methods and some very good ones. Inasmuch as indifferent methods of killing fowls are matters of utter indifference to the readers of agricultural papers, I shall pass them by, and endeavor to give a few practical suggestions that may lead to some slight improvement in dressing poultry. One method of killing chickens is to take the bird by the head and swing the body around two or three times rather quickly, which breaks the vertebræ and causes death speedily. Another is to give the fowl a sharp blow on the back of the neck with a small stick; this also causes death. Still another is to run a sharp penknife up through the roof of the fowl's mouth, penetrating the brain and causing death almost instantly. The method of killing poultry that suits me best and one in no way objectionable, is to tie the fowl's legs together and hang it up, head downwards, and with a sharp knife make a slit through its neck in such a manner as to pierce the principal vein. When the killing is performed in this manner, the fowl is thoroughly bled, and with birds whose feathers are valuable, it is the best possible method of killing. The feathers are perfectly clean and not disagreeable to handle.

There is another advantage in favor of this method and one which will bear mentioning; and that is, that in fowls whose heads have been cut off, the skin on the neck is drawn away down, which, to say the least, does not improve the appearance of the fowl. In the method which I have suggested, all this is avoided by first dressing the birds and then cutting off the heads before going to market. Even then, if the skin has a tendency to draw away from the neck, it can be tied over the latter.

The fowls should be picked while yet warm. They should be picked dry, if it can be done without tearing the skin. If this is tender and liable to be torn, which always spoils the appearance of poultry, then a single dip in scalding water for barely an instant will prove a certain remedy. Scalding rather improves the aspect of poultry, giving, I think, a fresher and better appearance to the fowl than if it were omitted. Some fowls, as geese and ducks, it will be found necessary to *singe*, in order to remove the fine downy feathers which can be removed in no other way. This is accomplished by making a good blaze with a quantity of paper, and then taking the fowl by the legs and neck and turning it once around in the blaze. A single instant will be found sufficient, and there will be no appearance of smoking or scorching.

After being picked, the fowl should be "drawn;" that is, the inside should be removed. The heart and liver and the gizzard, after having been cleaned, should be replaced. This is an operation that should be performed with great care. It is only necessary to make an opening large enough to insert the two forefingers. I have seen fowls almost ruined by "boggling" done in dressing. I have this much to say in reference to "drawing" a fowl—that no amount of instructions will take the place of actual experience. Too much care cannot be observed in order to prevent the fowl from looking "mussy." This is one of the cases where neatness "tells." After the fowls are drawn, they should be prepared for market. It is hardly possible they will be marketed the same day they are dressed; at least, they should not be, as they are not nice to handle. Take the larger birds, such as geese and turkeys; tie their legs together to facilitate hanging up; pass a cord around the body, confining the wings close to it. This will very much improve the appearance of the fowl in market and make it much easier to pack, if it is desirable to do so. After this has been all attended to and the fowl has been well washed, both inside and out, with warm water, and rinsed in clear cold water, it should be hung up in some cold room and allowed both to drip and stiffen.

If the fowls are to be sold to private customers, too much care cannot be exercised in preparing a good article in a neat manner. Purchasers are apt to take notice of carelessness, and are also sure to know when they have received a poor article. Let the fowl be a good one, and sell it for just what it is. Do not sell a five-year-old gobbler for a young turkey. Prepare the birds nicely, and if there is any profit in the business, poultry handled in this manner will be pretty apt to realize it. If the fowls are consigned to commission men or jobbers, let the same care be observed in preparing them for market. They should be closely and carefully packed in boxes or barrels and consigned to none but reliable dealers. And here the same good faith should be observed. The farmer should resist the temptation to slip in a poor fowl with the good ones. No box or barrel of fowls should be shipped without marking in plain letters the name of the consignee on the package. I think that poultry dressed and marketed in the manner I have suggested, will be found reasonably profitable—at least such has been my experience.

St. Lawrence Co., N. Y.

CONSTITUTIONS OF POULTRY.

HENRY HALES.

AFTER considering poultry as one species, it is not a little remarkable that the various breeds show a considerable diversity of constitution and longevity. Domestication not only brings out various colors and sizes, but every so-called breed of fowls differs in many other respects from the others, even as regards constitution and liability to certain diseases, some of which are known to have been imported with the birds; for instance, scaly legs—elephantiasis—was never seen in our poultry until its introduction with the Cochins and Brahmas. These grand, massive birds brought us cholera too; but at the same time they brought a constitution almost proof against cold. While all other breeds are more or less sensative to this, these heavily-feathered birds appear quite indifferent to it, and lay on through the coldest weather; whereas other breeds do not seem able to keep up enough internal vigor to make eggs in very severe cold. During chickenhood they are also very hardy and easily raised.

One would certainly expect the largest breeds to be longer-lived than the smaller ones, but this is not always so; the large Asiatics are not as long-lived as most of our ordinary-sized poultry nor do they keep up their laying qualities like many fowls. After they have attained the age of three or four years, they seem infirm, getting very fat when well fed, and unproductive, while Dorkings are not in their prime till they are two years old, and keep up their vigor for seven or eight years. I know of a Silver Gray Dorking hen ten years old, that still keeps laying. I had one eight years old that brought up two broods last year; but the Dorkings have not the constitution while they are young that the former have, but get strong when full-grown. Their principal weakness when young appears to be in the throats and breathing. They seem to outgrow their strength, for when they attain a certain size they are then hardy. Spanish fowls feather very slowly, and are sensative to wet and cold during their half-naked period. Leghorns, although of the same class, feather very quickly, and the Brown are specially hardy when very young; but are not hardier than most others when adult birds. They are then as much liable to roup as many other breeds. All the Hamburg family are predisposed to roup, so are Games and Bantams. The Polish are very delicately constituted; so are the French, of which the Houdans are the hardiest. The cross that produced the Plymouth Rocks seems to have grafted the weather hardiness of the Asiatics on the already comparatively hardy Dominique.

In giving this comparison of constitution, let it not be supposed that I recommend or disfavor any of the breeds on account of constitution alone; they have all their respective merits that are not to be overlooked. My object is now simply to classify their weaknesses, which every breeder should understand, especially the young fancier and farmer. I know there is a great disinclination among breeders of poultry to admit these facts; but why? They are sure to be found out sometime or other, and by knowing beforehand what to expect, one is better prepared to encounter or even prevent the ill effects of such constitutional weakness.

Sheep Husbandry.

A PROFITABLE SHEEP ACCOUNT.—On Nov. 8 Abel Hoyt & Son gave a statement in the RURAL of their gross income—$128 35—in one year, from a flock of 18 ewes and one ram. In our issue of Nov. 29 a N. J. correspondent, mistaking the gross for the net income, asked for an account of the outlay for keeping the animals. Messrs. H. & Son write us that their object in giving the account was to show farmers in different parts of the country what the entire income from such a small flock of sheep might be, each being able to judge best for himself what the cost of maintenance would be in his locality. In estimating the cost of keeping them, our correspondents offset two cows against the flock, or nine sheep to a cow. Eight full-grown sheep might be a fairer proportion, but five of these were yearlings or lambs. It is generally estimated that 2½ tons of hay are required to winter one cow; and hay in their neighborhood, Saratoga Co., N. Y., was worth seven dollars a ton last year in the barn. A small amount of grain was fed during lambing season. The usual price for pasturing one cow there is eight dollars, so that the account would be about as follows:—

Gross income		$128.35
Outlay—5 tons of hay, @ 7	$35.00	
Pasture	16.00	
Grain (estimated)	5.00	56.00
Net Profit		$72.35

With regard to care, all needed attention is thought to have been amply repaid by the manure.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

CONDUCTED BY

ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, JAN. 3, 1879.

A GLANCE BACK.

We have sometimes regretted that we changed the price of the Rural New-Yorker from $2.50 to $2 per year. We have no evidence that our increase of circulation is to any extent attributable to that cause; while, on the other hand, the lower price obliges us to be more cautious in continuing to make the marked improvements which have characterized the progress of the paper for several years past. Of those to whom we have sent specimen copies as many as ever reply that they would subscribe if we could make the subscription price less than it is. Now there are, no doubt, some progressive farmers and horticulturists who, while they are hungry for the best books and periodicals, are yet so poor that the difference of a dollar or even fifty cents in price would decide them to rest satisfied, for the present, with a lower grade of literature. With this class we sympathize. We would be happy if we could send them the Rural for 50 cents per year. But there is another class—a very large one too—that seems to have no appreciation of what constitutes *value* in agricultural journals, and a low price is the first if not the only requisite to engage their favorable consideration. We have no slurs to cast either upon this class or upon the cheap periodicals they choose to read. They have just as good a right to their opinions as we have to ours. The influence of an agricultural paper must largely depend upon the appreciation of its subscribers, and in this as in all things else, "birds of a feather will flock together."

We hope it may not be considered out-of-place at this time if we dwell for a moment upon the more marked improvements which have been made in the Rural New-Yorker under its present management and during the past two years and a half

First—Our columns have been filled by contributions from the ablest writers in the land. This has been freely admitted by the press in general, and even by leading agricultural and horticultural journals.

Second—With the exception of an occasional column or so under "What Others Say," the "Practical" departments of the paper have, without a single exception, been filled with *original* matter; and, to a considerable extent, the same may be said of the "Literary" departments.

Third—Nearly all of our engravings of farm, garden and orchard plants and fruits have been executed from drawings from nature by our own artists, and the same may be said of our building plans and farm contrivances—they have been drawn from original sketches or models. Now, if these had been old cuts that often "go the rounds" of both hemispheres, electrotypes of which may be purchased for a few cents per square inch, it would cost us less to use them than to fill the same space with a high grade of original writing. As it is, however, our drawings and engravings constitute one of our *heaviest* items of expense, to say nothing of the time, labor and research required to *obtain the subjects to be drawn.*

Fourth—We are the first, so far as we are aware, to have established experiment grounds in direct connection with journalism, an example we are gratified to see is likely to be followed by other journals who appreciate their great value in such connection. It is, however, to be regretted that the tendency is to copy after the objects and methods of the great Rothamsted farm of England, where Dr. Lawes for forty years has conducted a series of valuable experiments, the results of which are so trustworthy that little can be learned from their repetition even though other experimenters as rarely fitted in every way, could be found to conduct them. The object of the Rural's Experiment Grounds has been to test new plants and seeds, whether for the farm, garden or orchard; to produce improved varieties by cross-breeding, and to disseminate such rare and promising seeds and plants among our subscribers that, without expense, they may determine their value for their own lands. We are free to state that whether our labors in this field have or have not been serviceable to our readers, no mere profit to be derived from the income of the Rural New-Yorker alone will be likely to compensate us for the cost of maintaining and working these experiment grounds.

Last—We have somewhat improved the quality of the paper upon which the Rural is printed; we have enlarged it by lengthening its columns; we have improved the mechanical execution in every way; we have increased our editorial force in order to insure greater care and accuracy in every department. These, however, need not be dwelt upon, since they are improvements which might reasonably be looked for in any progressive, prosperous journal. We need not either dwell upon our Free Plant and Seed Distributions, for the reason that these are self-imposed offerings to our subscribers, which in every way we reserve the privilege to regulate to suit ourselves. But the cost is immense! We are afraid that few of our friends would *believe* us, were we to state in exact figures what these distributions have cost us during the past year. We have more than once paused to ask ourselves if the money could not be more advantageously expended. And the only reply has been another question which we could not answer, viz.:—"In what way?" Many of our friends have said to us: "Why send out such *costly* seeds? Would not the bulk of your subscribers appreciate just as well good, though well-known varieties of corn, wheat, oats, beets, lettuce, Zinnias, Lady's Slippers, etc., etc?" This may be true—we are half-afraid that it is. But this would upset the very *objects* of our distributions, and we should very decidedly prefer not to distribute plants or seeds at all. Our object is to send out *new* plants of great promise, with a view to promoting the farmer's or gardener's interests over the entire country; our object is to enable every one to test these high-priced novelties, so that if good, he shall derive the benefit—if poor, he shall not be the loser! As to the well-known seeds suggested in place of those we grow or select, every seedsman can furnish them in any quantities, and we are far from desiring to trench upon the seedsman's sphere of operations. Most of the seeds we offer cannot be purchased, or if they can, only in foreign countries or of the producer! This oft-repeated assertion of ours is as true as any words that can be spoken.

Rural Readers, it will be seen by you who have followed us long enough to be enabled to judge, that we are in deep earnest, and that we have indeed at heart, as our foremost errand, the advancement of the best interests of those whose income is derived directly from the soil. We have made you many promises—positive and implied—we have fulfilled them all, not, it need not be qualified, "to the best of our abilities," but in full to the very letter—and more. What shall we say for another year? Can we do better than to offer last year's work as evidence of what this year's work shall prove if life and strength be spared us? It has been usual to announce for the new year a list of contributors. This may well be omitted. All of our old contributors, so far as we know, will continue with us, and contributions from several new writers of equal ability and prominence will soon appear. The interests of all parts of our country shall be treated alike, as our widely distributed circulation permits. We solicit from all the freest possible criticisms of our course and of our work. Nothing that is well intended can give us offense, and we fully recognize the fact that we must first be conscious of our weak points before we can materially strengthen them. Articles upon any given subject of general interest will be furnished as requested. We solicit short, concise communications relative to any topic suitable to our columns. All questions will be answered either by mail or in our Querist department.

Finally we return to each and every one of our readers our sincerest thanks for their hearty support and cheering words. We have never entered upon a year with brighter hopes; with a better defined feeling that the Rural is doing good and that its sphere of influence is again to be enlarged. A Happy New Year to all! Let us work faithfully to advance our cause—the magnificent, inspiring, noble cause of agriculture—and may we at the end of the year have no less reason to feel happy than we have now at its auspicious beginning.

TWO QUESTIONS ANSWERED.

We have been requested by a valued correspondent "to write an article that shall answer such a question as this: 'Can a young man of education, accustomed to refined society, and with a keen appreciation of, and love for, the elegancies of life, support himself and family on a farm, say of 160 acres, without daily crucifying his tastes and feelings? Must he see an uneducated, boorish laborer at his table every day?'"

To the first question we should say, Yes, to the second, No. Can he support a refined family at all on such a farm? Yes, if he has shrewdness, diligence and push, and *understands farming.* Otherwise not. He cannot support them by working as a tailor, shoemaker, blacksmith, merchant, doctor or lawyer, unless he has learned the trade well or studied the profession thoroughly. Why should he be able to do so as a farmer? He cannot make a living by the other callings without shrewdness, diligence and enterprise. Why should he on the farm? The more of these qualities he has, and the better he has learned his trade or profession, the greater will be his success in the other pursuits; why is not the same true on the farm? The days are past when "any fool could be a farmer." Real success in farming requires just the qualities the man in our question is supposed to have. Of course, his wife, and his children, when of suitable age, will need to be co-workers with him, just as they would need to be if he were a mechanic or tradesman. Nor is this inconsistent with refinement. Labor is not necessarily degrading.

But the gist of the question is, can he do this *without daily crucifying his tastes and feelings?* Unhesitatingly we answer, Yes. Such crucifixion must come, if at all, either from his *work* or his *associates, i. e.,* his hired help or neighbors. But very little of the ordinary farm-work is necessarily disgusting. The care of orchard, garden, vineyard, grainfield, may be made a constant delight. Every tree, shrub and plant is an object of interest, and their growth and development are full of daily surprises and enjoyment. Every colt, calf and lamb may be a friend whose society shall not be degrading, and whose gambols are graceful and delightsome. Every farm process taxes the judgment and ingenuity, at least if wisely performed. The use of the various implements and machines requires and develops skill. There is little monotony on a well-managed farm—none to compare with the dead and dreary monotony of shop or factory or huge mill, where, in the minute divisions of labor, the laborer is made a cypher or automaton. The man who, day after day, feeds iron to a nail-cutting machine, or boards to a planer, becomes in time scarcely more than a part of the machine.

Now it is not so with the farmer described in our correspondent's question. *He* will know enough of the geology and chemistry of soils to make him long to know more, and this makes him a constant student; enough of the botany and chemistry of plants to make him watch their growth and development with intelligent, inquisitive delight; enough of the anatomy and physiology of his dumb beasts, and of the laws of their development and improvement, to make stock-breeding to him a science, an art, and not a low, obscene and debasing trade. And so with the endless, round of ever-varying work that occupies the intelligent farmer. It all tends to arouse thought and study in a mind *once trained to habits of study.* There is the constant delight of novelty and change. There is nothing to dwindle a man into a cypher; even the automatic work of the farm need not have this effect. Such work as plowing, harrowing, driving crops to market, etc., are tasks that require no special mental attention, but set the mind free for planning for the future or for careful thought on questions of agriculture, mechanics, political economy, etc., connected with and suggested by such work. And the occasional unpleasant work need not be any "crucifixion." The proper saving, making, and application of manures are a science. The mud, manure, or filth, need not stain the farmer's character, or defile his tastes, any more than they do his feet through the impervious texture of his rubber boots. "Not that which goeth into the man defileth the man," said our Lord. Much less that which may chance to soil his hands or his clothing in his necessary labor.

So then this "daily crucifixion" need not come from the occupation of the farmer. Must it come from his *necessary* association with hired help? This association may be both while eating and resting in the house, and while laboring in field or barn. This brings us to our correspondent's second question. "Must the educated and refined farmer see an uneducated, boorish laborer at his table every day?" This, we suspect, is the real trouble! We fear our correspondent has sat at meals with men in barnyard boots and overalls, shirt-sleeves rolled up, and with sweat offending eye and nostril. Perhaps he has seen them, Blitz-like, half swallow their table-knives with every mouthful of food, heard them suck their soup from their spoons, or even drink their milk or coffee with a strong, loud inspiration of the breath that proved anything but an "inspiration" to his appetite. Or he has seen them daily bolt their food with the savage and indecent haste of a herd of pigs, or of railway travelers with the conductor's "All aboard!" ringing in their ears. For we have seen worse violations of table-etiquette and common decency, and suffered worse "crucifixion" at first-class hotels and restaurants than ever at any farmer's table. Not always under the pressure of haste, either, and often deliberately committed by men whose diamond studs and nicely fitting garments proclaimed them gentlemen, but whose manners marked them as boors.

Now the question is, "Need these things be so in the house and at the table of a refined gentleman who happens to be a farmer?" This opens up the whole subject of the *choice of, and association with,* farm help; a subject so important and many-sided that its consideration must be deferred another week.

With the return of good times after a period of depression, a rise in prices is naturally to be expected. The possession of money has a tendency to induce people to buy goods which they managed, sometimes at considerable inconvenience, to do without in the days of slim or empty pockets. A full pocket-book, is also a strong inducement to supply a hundred and one things which one could well dispense with in the absence of so welcome a persuader. All this increases the demand, while the facilities for increasing the supply are more slowly brought into full operation, and in the meanwhile, according to the inevitable principles of trade, prices must go up. Then again, timid capital gets bold in good times, and undertakes many new works, thus adding to the general prosperity, and especially to the prices of the commodities it chiefly uses in these undertakings.

On the above accounts and on others, farmers must expect and be prepared to pay considerably higher prices for most, if not for all, of the implements and machinery they may need the coming spring. Wages have in many cases been lately raised; the cost of materials are in all cases higher than a year ago; manufacturers are seeking to reimburse themselves for the slim profits of late years; middlemen are stimulated by the general good times to make all they can from all parties, and, as usual, the farmer must expect to contribute largely to the support and enrichment of all other classes.

Ever since the Philadelphia Centennial Exhibition of 1876, New York, as the commercial metropolis of the nation, has been earnest in its determination to hold a World's Fair that should far transcend that provincial show. Arrangements are almost completed now for carrying this resolution out in 1883. Last Tuesday there was a meeting of the Executive Committee held in this city, which Secretaries Sherman and Deven attended. With his natural clear-headedness, the former pointed out strongly the paramount advantages of New York for such an exhibition, and urged that it should be made to excell not only the Philadelphia affair, but everything of the kind that had ever before attracted the admiration of the world. Anyhow, there's going to be a World's Fair here in 1883, and a big one, too.

BREVITIES.

The corn premiums offered for the best yields of Blount's corn will be awarded immediately after New Year, and the announcement of the winners will be made in the Rural of Jan. 17th.

The "possibilities of an acre" of wheat must be something indefinitely high, since "Everywhere" tells us from Huron Co., Ohio, that in some places actualities there amounted to 51½ bushels. There must have been a world of tillering to produce that result. It would be interesting to know whether the seed was sown in accordance with the conditions which Professor Stockbridge, elsewhere in this issue, describes as most conductive to that end. Out in Montana, however, the Territorial Fair Association lately awarded the first premium for the best acre of wheat to a yield of 102 bushels—very nearly double the large Ohio yield. Has any one ever heard of a larger yield—outside of Munchausen land? We haven't.

Literary Miscellany.

THE IRON GATE.

[A POEM delivered by Dr. Oliver Wendell Holmes, at the celebration of his seventieth birthday.]

WHERE is this patriarch you are kindly greeting?
Not unfamiliar to my ear his name,
Nor yet unknown to many a joyous meeting
In days long vanished—is he still the same?

Or changed by years, forgotten and forgetting,
Dull-eared, dim-sighted, slow of speech and thought,
Still o'er the sad, degenerate present fretting,
Where all goes wrong, and nothing as it ought!

Old Age, the gray-beard! well, indeed, I know him—
Shrunk, tottering, bent, of aches and ills the prey;
In sermon, story, fable, picture, poem,
Oft have I met him, from my earliest day.

In my old Æsop, toiling with his bundle—
His load of sticks—politely asking Death,
Who comes when called for—would he lug or trundle
His fagot for him?—he was short of breath.

And sad "Ecclesiastes, or The Preacher,"
Has he not stamped the image on my soul,
In that last Chapter, where the worn-out Teacher
Sighs o'er the loosened chord, the broken bowl?

Yes, long indeed, I've known him at a distance,
And now my lifted door-latch shows him here;
I take his shriveled hand without resistance,
And find him smiling, as his step draws near.

What though of gilded baubles he bereaves us,
Dear to the heart of youth, to manhood's prime;
Think of the calm he brings, the wealth he leaves us,
The hoarded spoils, the legacies of time!

Altars once flaming, still with incense fragrant,
Passion's uneasy nurslings rocked asleep,
Hope's anchor faster, wild desires less vagrant,
Life's flow less noisy, but the stream how deep!

Still, as the silver chord gets worn and louder,
Its lightened task-work tugs with lessening strain:
Hands get more hopeful, voices grow more tender,
Soothe with their softened tones the slumberous brain.

Youth longs and Manhood strives, but Age remembers,
Sits by the raked up ashes of the past,
Spreads its thin hand above the whitening embers,
That warms its creeping life-blood till the last.

Dear to its heart is every loving token
That comes unbidden ere its pulse grows cold,
Ere the last lingering ties of life are broken,
Its labors ended, and its story told.

Ah, when around us rosy youth rejoices,
For us the sorrow-laden breezes sigh
And through the chorus of its jocund voices,
Throbs the sharp note of Misery's hopeless cry.

As on the gauzy wings of fancy flying,
From some far orb I track our watery sphere—
Home of the struggling, suffering, doubting, dying,
The silvered globule seems a glistening tear.

But Nature lends her mirror of illusion,
To win from saddening scenes our age-dimmed eyes.
And misty day-dreams blend in sweet confusion
The wintry landscape and the Summer skies.

So, when the iron portal shuts behind us,
And life forgets us in its noise and whirl,
Visions that shunned the glaring noonday finds us,
And glimmering starlight shows the gates of pearl

—I come not here your morning hour to sadden,
A limping pilgrim, leaning on his staff—
I, who have never deemed it sin to gladden
This vale of sorrows with a wholesome laugh.

If word of mine another's gloom has brightened
Through my dumb lips the Heaven-sent message came;
If hand of mine another's task has lightened,
It felt the guidance that it dares not claim.

But, oh, my gentle sisters, oh, my brothers,
These thick-sown snow-flakes hint of toil's release;
These feeble pulses bid me leave to others
The task once welcome; evening asks for peace.

Time claims his tribute; silence now is golden;
Let me not vex the too long suffering lyre:
Though to your love untiring still beholden,
The curfew tells me—cover up the fire.

And now, with grateful smile and accents cheerful,
And warmer heart than look or word can tell,
In simplest phrase—these traitorous eyes are tearful—
Thanks, Brothers, Sisters—Children—and Farewell!

IN FOLLY'S NET.

(Continued from page 845.)

"Her prayer was heard and answered; she was saved from that terrible sin, she locked away the poison. I have but little more to say, gentlemen of the jury; confidently I leave the rest in your hand. It is for you to decide whether the prisoner at the bar be guilty of the crime of which she is accused—whether the woman whose life we have traced back in its gentleness and purity, who has borne trial nobly, and defeated temptation grandly—be one likely to sink to such depths as these! If she had been accused of having taken a knife in her despair, and sheathed it in her husband's heart, you might have believed that; but of such a cold-blooded crime as this she is incapable, it is not in her nature—it would be impossible for her to commit it!"

Sir David sat down with his face as calm and impassive as when he had risen; but ere he sat down he gave one glance at the jury. It was enough—a slight smile flashed over his lips—that one glance had told him what he wanted to know, and when they went away to deliberate he knew what their verdict would be.

Jean did not move—she still kept the same posture, with her fair face half-hidden on her maid's shoulder. Once she had murmured a few words in answer to a question from Collins, but that was all. Those who loved her watched her with anxious eyes; there was something in this unnatural stillness and calm that had a more horrible dread for them than the wildest distress or passion of terror could have had.

CHAPTER XXVIII.

"BECAUSE I LOVE YOU."

IT had been almost spring-time when Jean Blair had been tried for her life, and the summer was past and gone before she was able to leave her room after the long and serious illness which had followed the trial, and during which she had been unconscious of all that passed around her—of the anxiety of those who cared for her, or of her own danger. A burning fever consumed her, her eyes were without light or sense, her lips were parched and dry, and the loud, uneven panting beats of the poor heart which had suffered so much, could be seen when the little, hot hands hung the coverings off her aching chest. Her only cry was for "water, water;" for thirst consumed her with an intolerable torment.

It was terrible to see her suffer thus; each unconscious sigh that broke from her, each movement of the fevered, aching limbs, each look of anguish from the sleepless, sightless eyes, rent the loving hearts which watched by her bedside and did all to alleviate her bodily suffering that was in their power.

But more heartrending than even her bodily pangs, to those who tended her, were the indistinct, unconnected, wandering words which escaped her lips; sometimes she was in the prison, longing for yet dreading the trial; then she was in court with the hundreds of eyes upon her; at other times she was in the past, in the fresh, fair scenes, before trouble had touched her; before she had suffered and borne—sometimes she thought herself with Lord Ivor, happy, beloved, and loving; and then a terrible shadow would cross her face, and she would relapse into silence for a time.

But she was young and strong, and in the end youth and strength conquered; after many weeks of suffering the fever left her, and consciousness returned. It left her weak, feeble, helpless as a child, but the recovery was but a work of time, the doctors said—she would soon get stronger now.

She was at Sholto Hall all this time, for Blair Gates was closed. Mrs. Fergus Blair, having been defeated in her object, had returned to Edinburgh, and Blair Gates was tenanted only by the servants. Mrs. Brett had left the neighborhood—none knew whither she had gone. By Mr. Blair's will she had been left well provided for, and she had had few friends among the household. Freeman, the steward, was looking after the estate. Lord Sholto rode over sometimes and thought of the rich demesnes which were now in Jean's possession, and which could not, for many years, if ever, give her any pleasure.

Lord Ivor had spent most of his time at Sholto Hall, for though he never saw Jean, he could not have borne to be away from her at such a time; his anxiety at her dangerous illness had been very great—so great, that he had wandered about the house and grounds, looking haggard and miserable, and utterly wretched. But at last the change for the better had come; Jean had been pronounced out of danger, the heavy shadow of gloom which had hung over the house had been lifted, the servants went about their duties with cheerful countenance once more.

Ida Crawford's fair young face brightened, and her sweet voice could be heard singing about the pretty rooms; and Captain Murray, who had behaved in a most exemplary manner during the long, anxious time through which they had passed, began to grow eloquent against such a long delay, and to press for an early date for the marriage.

On his first interview with Jean, he had won her over to his side; and when he had left her she had sent for Ida, and pleaded the cause which was already nearly won.

"Do not let me think that I have brought suffering on all whom I love, Ida," she said, softly. "I do not want your husband to dislike me because your pity for my unhappy fate makes you keep him waiting. Let it be as he wishes, dear, and may you have every happiness!"

So Captain Murray prevailed; milliners and dressmakers were called into play, and when the autumn was turning the fair green leaves red and golden before the wintery winds swept them to the ground, a fair young bride knelt in the parish church at Sholto, and plighted her troth "for better or worse." And when the ceremony was over, she came in her sweeping white robes, with the lace veil still on her orange-blossom crowned brow, to show herself in her bridal finery to Jean as she lay white and languid on her sofa, and smiled her welcome with such sweet tenderness, that Ida's lip trembled as she kissed her, and Captain Murray bent to touch the little frail hand held out to him reverently as he might have touched a queen's.

It was a quiet wedding, and followed by no ball. In the afternooon the bride and bridegroom drove away together, and Lord and Lady Sholto as they stood and bidding them farewell, wished them "God-speed," thought of another bride and bridegroom who had left Sholto Hall scarcely a year ago under such very different circumstances.

Quiet as it had been, of course the wedding had brought many guests to Sholto Hall—relatives of the bride and the family of the bridegroom; and in her quiet little sitting-room sounds often came to Jean of the life and gaiety which reigned below. She was much alone just now, for Lady Sholto's time was much taken up by her visitors; and now that Ida had left, many hours would be necessarily lonely, for Lord Sholto's sister had conceived a deep and heartfelt admiration for Jean's behavior during her trouble, and had spent every spare moment by her side.

"You need not light the candles, Collins," she said to her maid, in the evening of Ida's wedding-day. "I like the firelight now. I am so lazy, lying here."

"Very well, ma'am," Collins said, quietly. "Lord Ivor wishes to know if you will receive him this evening—if it will not tire you."

"Oh! no," Jean answered, quietly. "Tell his lordship I shall be very glad."

A few minutes after the Earl entered the room, which was lighted only by the pleasant dusky light of the fire, which was blazing cheerily, and lent a warm touch of color to Jean's pale cheek as she lay on the cushions, and held out her hand to him with her old bright smile.

"I want to hear all about the wedding," she said, with a touch of her old gaiety. "Florence had not time to tell me. I only know that the bride looked lovely and the bridegroom radiant, for that I saw for myself."

"Everything passed off very well," he answered, pulling a deep arm-chair over to the fire, and ensconcing himself easily therein in an attitude of careless ease, and in a position whence he could watch the sweet, wan face, so precious to him still. "The bride, as you say, looked lovely! Murray was beside himself with happiness, and the speeches were quite *en regle*: there was no opportunity to quote the well-worn saying, 'Lost a daughter and gained a son,' you know; but I am sure everything else was said that is usual on such occasions."

Jean laughed softly; it was an uncommon occurrence for the Earl to come and spend a long afternoon or evening with her in her solitude, and since her illness he had been almost constantly at Sholto Hall. He had not spoken of love to her, and they had drifted into a warm, close friendship, which satisfied Jean, and appeared to satisfy the Earl; but he was only waiting—waiting with all the patience of a deep, true love—for the time when he should deem it right to speak to her of the old relations between, and ask for their renewal.

Perhaps the sight of Captain Murry's happiness had given a spur to his impatience; perhaps, the great love he bore Jean would wait no longer; perhaps he thought that the nine months which had elapsed since Mr. Blair's death were sufficient. Be it as it may, he had come to her this evening, making up his mind to put his fate to the touch, and "win or lose it a'."

"And you returned thanks for the bridesmaids as best man, I suppose?" Jean said. In a moment "What did you say?"

"I escaped that penance," he answered, laughingly. "Ida agreed with me in thinking that the proper thing is for the youngest groomsman to do so; and little Trevena made a capital speech, only breaking down once, when he looked at Lucy Greville, and found her pretty blue eyes fixed admiringly upon him. I should not be at all surprised, Jeanie, if there was another wedding ere long in which Trevena and Lady Lucy take prominent parts."

"He is a nice fellow but too young to think of matrimony, surely."

"He will be soon of age," said Lord Ivor. "The best thing he can do is to marry young, because he has time to play ducks and drakes with his property."

There was a short silence, then the Earl leant forward where he sat, and said softly:

"Jean when am I to be made happy?"

She started violently and the great brown eyes, so much larger and sadder since her illness, went to his face with a sudden dread in their depths, while the color flashed up for a moment into her face, giving it back almost its old beauty and brilliance.

He drew near her, and took the little slender hands tenderly in his strong clasp.

"I do not want to startle you, dear child," he said, caressingly; "nor to distress you in any way; but, darling, I have had a weary waiting, and I have been patient; when may I have my reward?"

"Your reward!" she repeated, vaguely.

"Yes, my reward—your love!"

The rose-flush faded, and a shudder ran through Jean's slender frame. She knew that this moment must come, and she had dreaded it with an unutterable dread; now that it had come, she had hardly strength to bear it. She lifted her little hands, and covered her face with a sob.

"I have startled and agitated you," he said, tenderly. "Forgive me, darling; I ought to have remembered that you were not strong yet. I will not urge you further, Jeanie; but surely you can give me one word—only one word, to tell me that your love is mine still—that soon you will give me the right to take care of you and cherish you."

She answered him nothing. Lying there still, with her hands hiding her face, she shuddered as if in dread, as if in terror.

"Is it that you have ceased to love me?" he said, suddenly, and his voice grew hard and cold.

She uncovered her face, and as her eyes met his, the look of reproachful love was sufficient answer; the momentary doubt faded.

"Forgive me, darling," he said, penitently. "That was a cruel speech. See, I will not tease you any further. You shall answer me when you will, dearest child; but remember, Jeanie, that I have loved you so long, and that I have waited patiently."

He rose from his chair as he spoke, and went over to the piano, while Jean turned her face to the cushions and cried softly, as in very weakness and terror of the answer she must give him.

The Earl sat down and opened the piano; he was an accomplished musician, and often, during the languor and debility which had weighed upon Jean in the first weeks of her recovery, he had spent hours unwearied at the piano, trying to sooth and cheer her. Now, as his fingers wandered over the keys in some of Beethoven's softest melodies, Jean's tears flowed fast and unrestrainedly as she lay with her face hidden from his gaze. Softly the Earl played on; from where he sat he could see the bowed head and slender, recumbent form; he had not meant to pain her, but he felt an undefined dread of what her answer would be, which he strove to set aside in vain; and so watching her, he finished the sonata, and played a sweet, dreamy prelude. Then his rich tenor voice rose clearly and sweetly in the silent room:

"The love that deep within me lies,
Unmoved abides in conscious power;
Yet, in the heaven of thy sweet eyes,
It varies every hour.

"A look from thee will flush the cheek,
A word of thine awaken tears;
But, ah! in all I do and speak,
How frail my love appears!

"But storms may rise and thunders roll,
Nor move the giant roots below;
So, from the bases of the soul,
My love for thee doth grow!

"It seeks the heaven, and trembles there
To every light and passing breath;
But from the heart no storm can tear
Its rooted growth beneath!"

The song came to an end; the singer arose, and crossing over to Jean's sofa, gathered her in his arms to his heart.

"Even so do I love you, my darling! Can you be insensible to such love?" he murmured, tenderly.

"Not insensible, ah, no!—not ungrateful, ah, no!" she said, passionately, as she strove to release herself from his clasp, and lifted her wet eyes to his face. "It is but too precious to me, Archie; and because it is so precious, I cannot accept it!"

"Cannot!" he repeated. "My dearest, you took it long ago, and you have never given it back. I will not take it back, Jeanie!"

"But you must, dear!" she said, gently. "Archie, listen."

"I am listening," he said, softly, looking at the fair face on his breast with infinite love and compassion. "Say on, my dearest!"

"You will not be angry? I cannot bear your anger," she pleaded.

"Angry with you, Jeanie! Is that likely?"

"It is possible!" she said, sadly.

"I think not! Try me, love!"

She shivered as he held her. How could she say to him what she meant to say—what she must say!

CHAPTER XXIX.

"Archie!" said Jean, at length, with her wet cheek resting against him, and her eyes seeking his with a prayer in their depths, "it is very hard to say it to you—but I must; and you will not be angry, because you know how I suffer in speaking the words which will part us?"

He smiled, holding her closer to his heart.

"You must believe me," she went on, with feverish earnestness, "and you must make it easier for me, Archie! I will never bring disgrace on the one I love—I love you too well to accede to your wishes!"

"Disgrace!"

"Yes, disgrace!" she repeated, more steadily. "Think what I am, Archie, a woman who has been tried for her life—a woman on whom the stain of imputed crime lies heavily still! Remember the verdict was "Not Proven," it does not clear one of guilt because the crime was not proved against me!"

"It means the same thing, Jean. What foolish scruples are these!" he said, quickly. "Are you going to break both our hearts with this folly?"

"Not break yours, my dearest, I trust," she said, trying to smile. "You have not considered enough, Archie; your ancient name and stainless lineage shall receive no blot from me, and hundreds deem me guilty still; hundreds would say you had wedded a—a——" her voice failed.

"Hush!" he said, passionately, "how can you soil your lips with the word? If it be as you say there is all the more reason for you to accept the shelter of my name. Who will dare to accuse you when you are my wife?"

"I will not bring shame to you, Archie!" she repeated, drearily. "I will not, because I love you!"

"Even if you should, I love you enough to bear the shame gladly," he said, quickly. "Jean, you are breaking my heart!"

"No—no!" she said, in a tone of pain. "It is to save you pain that I speak! Dear, the time would come when you would regret the sacrifice—when you would wish you could undo what you had done!"

"Do you think me so base and so cowardly?"

"Ah! no! I know you to be noble and good. I know that you would never say one word to remind me of my shame; but I should see it in your face, Archie—I should read it in your eyes; and one look would kill me, Archie for I love you!"

"Have you considered?" he said, passionately. "You, who speak so coldly and dispassionately, have you thought of what life will be in the future if you are to be alone? If the world casts shame upon you, will it be easier to bear without the shelter of my love? Can you fight alone better than when I am at your side?"

A look of infinite sadness and desolation came into her face.

"Easier?—better?" she repeated, faintly. "Without you! Ah! no; and yet it must be, Archie!"

He turned from her with a gesture of impatience.

"So my love is nothing to you?" he said, angrily. "Do you not care that I suffer? Jean, there are times when you make me doubt your love!"

A little cry of pain broke from her, her head sank, her hands were pressed together like one who suffers beyond her strength; but she gave no sign that she yielded. She loved him with an unutterable love, but she would not accept the happiness he offered—she would not seek his tenderness in her shame; for she spoke but the truth when she said the stain of crime lay heavily on her still. She loved him *too* well to become his wife.

In proportion to her love was her agony—there was no consolation possible to her. It would have seemed mockery beside the supreme renunciation of this living sacrifice of her intense love, which gave itself to misery and desolation without a thought of its own devotion, without a glance at its own unasked and cruel self-immolation.

He watched her in silence, never thinking but that she would yield in the end, never thinking

she would refuse the love and tenderness he offered. He spoke truly when he said she needed the shelter of his name and of his devotion. As Countess of Ivor the world would have been chary of casting a stone at her; as Jean Blair, alone and unprotected, they would have an additional weapon in the fact that even he who loved her had forsaken her.

The light of the ruddy fire fell full upon her face as she stood, showing plainly the ravages her trouble had made; and lifting her eyes, she let them dwell on him with a love he could not but see and feel—and, seeing it and feeling it, he came back to her, and sank on his knees beside her.

"Ah! forgive those cruel words," he murmured, tenderly. "Darling, you are trying me sorely, and I have no more patience. Put your hands in mine, sweetheart, and tell me that you will accept the love I offer—that you will be my wife!"

"No," she repeated, drearily, "no."

"No!" He rose and moved away; she looked after him with yearning eyes, and her lips trembled at the anger and pain on his face.

There was a pause then—there was a lifetime of anguish to her concentrated in the few moments which followed.

"Is your decision irrevocable?" he said. "Could no change of circumstances alter it?"

The stony calm of her face broke, a gleam of hope shone in her sad eyes.

"Only if my innocence were clearly proved," she said, faintly.

"Not otherwise, Jeanie? think to what misery you are condemning us—think of your own loneliness—think of my anguish!"

"Better loneliness than worse pain—better a short anguish now than a lifetime of misery," she said, in a voice of one in deadly pain.

"You send me from you?" he went on, in a low hoarse voice.

"I cannot bring you shame."

"If I am willing to accept it?" he pleaded, more gently.

"I cannot bestow such a gift, Archie," and she stretched out her hands to him in passionate entreaty; "do not leave me in anger."

He sprang to her side again, caught her in his arms, covering her eyes, lips, hair, and her little thin hands with the closest kisses, and the red blood rose in her wan cheek under his touch.

"You will have pity on me, Jeanie? Darling, I am trying to be patient, but you are taking from me all my happiness"

She tried to disengage herself, but he held her close.

"You will not send me away?" he cried. "You will not—Jean—you will not!"

"I must," she said, faintly.

He flung himself away from her with a passionate exclamation of pain, covering his face with his hands. She stood watching him with a hopeless agony on her face.

"I must," she repeated; "do not let your last words be angry ones. I love you—I shall always love you, but I cannot bring you disgrace!"

"You never loved me!" he said, fiercely.

"I love you but too well," she answered, gently.

"Then why condemn me to misery?" he said, more softly.

"Why? Because of that love."

He watched her for a moment with wonder, and admiration, and reverence; he loved her well, truly and deeply, but he never loved her with such a love as that!

Going to her side, he took her hands in his.

"I love you," he said, gravely and quietly. "I love you with my whole heart. Nothing can change my love. You send me from you and I go, but if ever you wish to recall your decision, a word from you will bring me to you again."

He stooped and kissed her as he spoke—a grave, long, tender kiss, in which was no passion now.

"We can be friends," she answered, tremulously. "You know I am leaving Shotto soon; the doctors tell me I must not winter here. I am going southward with the swallows," she added, forcing a smile. "Meanwhile we can be friends, can we not?"

"No, friendship is possible between us," he said, brokenly. "I cannot be your friend, Jeanie. If you are ever in trouble, and need a friend's assistance—send to me then, and I will come, I will be your friend."

He waited a moment longer, but she did not speak; her eyes dwelt on him with a long, lingering glance, in which was a hopeless melancholy, a long farewell; then he dropped the hands he held in his clasp, and left her, not daring to speak again, to her loneliness.

She stood for a moment as he left her; her tears fell fast and heavy down on the clasped frail hands—she was so lonely, so alone now; and her heart ached for love, her youth craved for happiness, as a thirsty man craves for the cool water to quench his thirst, and both were denied her.

CHAPTER XXX.

SLOVALE AND ITS GOSSIPS.

The place which Jean had chosen for her winter residence, and whither Collins accompanied her, as soon as she was able to bear the journey, was a lovely little Devonshire village, nestling in a valley, rich in all nature's loveliness, and hidden away in the heart of that fairest of all England's counties. It was a quaint, sleepy little place, with but little changes as the years passed on, save in the outward face of nature, the change of the seasons; the fair, tender colors of spring, the richer glow of summer's beauty, autumn's splendid, fiery magnificence, and winter's grave, cold sternness, succeeded each other in due course; a few lives began, a few ended there, as time went on, but the village itself slumbered on. There was little poverty there and little vice, but there was as much meanness, as much petty envy and jealousy, ay, and more, than in larger towns, where if crime is more frequent, charity is wider, and pity more generous.

Thither Jean had gone to recover health and strength in the mildness of its soft air, in the shelter of its wooded hills. Collins was with her, and two or three of the servants from Blair Gates who loved her, and who asked to go with her; it was but a modest little establishment for her wealth, but she cared for no more; she only wanted to forget, and in Mrs. McLeod (for she had retaken her maiden name), she hoped to pass unknown and unnoticed.

Lord Shotto had taken a house for her—a quaint, pretty little villa, which they had made as dainty and luxurious as possible, so that her arrival was rather eagerly looked for by the residents of Slovale, consisting chiefly of the members of decayed families, who prided themselves on their respectability and position, and were generally poor and arrogant, and sticklers for "birth and connections."

To these people the new tenant of Bellevue was an object of absorbing interest; that she was rich seemed evident, for all the appointments of her house, though simple, were of the best and most costly; the two horses in her stables were thoroughbreds, her one carriage was perfection; her staff of servants—three maids and a man—seemed large for one lady; a gardener and a stable man completed the establishment—small, indeed, in comparison to the household at Blair Gates or at Shotto Hall, but large in the eyes of the residents at Slovale

They learned that she was in delicate health, and young. Would she receive visitors, and go into society, they wondered. And very soon after her arrival that point was settled, for in answer to their calls, Jean sent prettily worded thanks and apologies, but said her health did not permit her to go into society.

On the first Sunday after her arrival the congregation at the parish church were all on the *qui vive* to see her, and more than one head was turned to look at the slender, graceful figure which came up the aisle in sweeping mourning robes and crape-covered face When she lifted her veil, there was eager curiosity to see the face it had concealed—a face unutterably sad and weary, but very fair to look upon. Then the calls had not been made, nor Jean's apologies for not receiving visitors, so Slovale was prepared to receive her warmly, and she was pronounced to be "very pale but pretty, and very good style."

But as days went by, and Mrs. McLeod showed no desire to become better acquainted with her neighbors, opinions began to alter; she was pronounced cold and still, the languor of her manner was dubbed affectation, her retirement insolence, even the pale beauty of her face lost its meed of admiration; she was sallow, her face wanted expression, while as for her figure, who "ever saw any beauty in a maypole?"

One or two of the gentlemen of the coterie were more generous; they saw Jean outwardly as she was, a beautiful, graceful woman, with suffering written distinctly on her face—suffering borne and conquered, but which had left its scars.

One friend only had Jean made: the clergyman of the parish had called upon her, and she had been pleased with his unaffected kindliness of manner and holiness of life. He was a young man, earnest and devoted, and not very long married; his visit had done Jean good, and she had entered warmly into his schemes for the improvement of his parish and the benefit his parishioners.

"If I can help you," she said, "I shall be very glad. I am rich, and have but little use now for my wealth."

When he rose to go, she held out her hand with some of her old sweet grace in the gesture.

"My wife would have called," he said, coloring a little, "but she is not yet strong."

"I know," she said, smiling "I heard that a little angel-life had fluttered into your home-nest lately. I shall be glad to see you again; and if you think it right to bring her, it will give me great pleasure to see Mrs. Moore."

"If I think it right," he repeated. "What do you mean, Mrs. McLeod?"

"Sit down again," she said, with a faint smile, "and I will tell you. When you know my name you will know all. McLeod is my maiden name, My husband's name was Andrew Blair, of Blair Gates."

There were a few minutes' stillness and silence, then Jean went on:

"Yes, I am that most unhappy woman," she said, sadly. "I was accused of the murder, and the verdict was 'Not Proven.' That many think me guilty, I cannot doubt; but those who knew and loved me did not distrust me for one moment. May heaven bless them for that generous belief in me!" she added, brokenly.

"You read the trial, Mr. Moore?" she said, in a moment.

"Yes," he said, hesitatingly; "I read it."

"And you deemed me guilty?" said Jean, lifting her clear eyes to his face for a moment.

"Yes," he answered, frankly. "And the verdict surprised me. It does so no longer," he went on quickly. "I believe you innocent, Mrs. McLeod. Yours is a face which cannot lie."

"You will keep my secret," she said, smiling faintly, as she held out her hand to him. "I need scarcely ask it. But if you bring your wife to me, Mr. Moore, you must tell her first. I can have no friends unacquainted with my past."

"I will tell her. As soon as she is able she will come to you," he said, and as he bent down in farewell, he touched her hand to his lips with as much reverence as though it had been the fingers of an empress.

So there was a close intimacy between the Rectory and Bellevue, and the other residents at Slovale were angry thereat. What right had Mrs. Moore to give herself stuck-up airs? She was not too unwell to receive Mrs. Moore, and to have the child at her house for hours together, and to go out driving with the Rector's wife. Public opinion was bitterly against her, and the winter passed by heavily enough to poor Jean, her only pleasures being the society of Mr. and Mrs. Moore and an occasional letter from Shotto Hall and Lord Ivor, who tried to write in a friendly tone, but whose deep love would break out in spite of his efforts to restrain it; and sometimes his letters had a yearning sadness, which made Jean's heart ache as she read.

She heard of him often, for he had thrown himself with all his energy into his political career, and was making himself famous. Jean's heart beat high with triumph as she read of his; her eyes flashed, her cheek brightened, she was almost happy then. Once, in a Court journal, she saw his name coupled with the name of one of the fairest *debutantes* of the season, a girl whom she had known and liked; and although her color failed and her eyes grew dim as she read, she tried to think she was happiest because his life was brightening, and in her next letter she sent a few tender congratulatory words, which came, as she told him, from her heart.

By return of post came the Earl's reply: It was shorter and colder than any letter she had ever received from him, and it gave a distinct and unhesitating denial of the assertion in the newspaper. Poor Jean was inconsistent enough to feel all the happier after the arrival of that letter.

"I wonder who the man was who was spoken of in the trial by Sir David Carnes," said little Mrs. Moore one day to her husband. "Don't you remember, George, she said she had refused to go to the ball because she was afraid of meeting him; I wonder why he did not marry her after the trial?"

"Perhaps he did not care to bear her shame with her," said the Rev. George, dubiously.

"Or perhaps she did not care to let him share it," said the little wife, gently. "And yet, if he had given her his name, they could have gone abroad and no one would have recognized her."

"He may have been some man of high rank, whose actions are always before the public," said the Rector, meditatively.

"Perhaps. I wish she would look less sad, George. It is dreary here for her."

"She is tranquil, at least, dear wife, and we will keep her secret," said the Rector, as he dismissed the subject, and turned to his interrupted sermon.

But though they kept her secret well and faithfully, it oozed out—by what means no one ever knew; but envy and malice have better eyes to discover than love has means of concealment; and after having spread all manner of false reports and stories about the tenant of Bellevue, the petty village gossips found out the truth, and spread it abroad with all the gusto of a great discovery.

It was some time before Jean guessed that she was known; she had kept herself too much in retirement to mark the avoidance and the open contempt with which they began to treat her; and her servants had long known the brand which was upon their mistress before it came to her ears, and it was only by chance at last that it did so.

Jean was walking alone down the village street when a little yellow-haired child, running across the road, fell on the rough stones and began to cry. Jean stooped and lifted it up, saying a few gentle words, and slipping a coin into the little chubby hands, grazed with the fall; but the child shrank from her.

"You shan't touch me!" he cried, sturdily, through the sobs. "You're wicked! My mother says you killed some one once!"

So saying, he ran away from her with a defiant glance, and Jean made her way home quickly, knowing that her secret was known, and feeling utterly miserable and desolate.

And then began a time which, to a sensitive, delicately-nurtured woman, was nothing more or less than martyrdom She dared not show herself in the street, so strong was her dread of receiving insults, or hearing coarse insinuations. It was in vain that Mr. Moore used all his influence to quell the angry tongues; in vain that Mrs. Moore went daily to Bellevue and showed the warmest friendship for poor Jean; scandal, having such a theme to descant upon, could not be silenced, and tongues wagged lustily.

"I must go away," said Jean, one day, to Mr. Moore, speaking ever so wearily. "I cannot stay; and yet, wherever I go, the same dreadful story will ever follow me! There is no rest, no respite for me! Oh, Mr. Moore! is it wrong to wish my pilgrimage ended? Every day seems more miserable than yesterday."

"Poor child!" he said, pityingly. "Be brave, and you will live it down!"

"Brave!" she repeated. "All my courage is gone; and yet I don't think I could die unless I knew that my innocence would be proved."

"It is in wiser hands than yours," said the Rector, tenderly. "My child, all things are working for good to them that love him."

"All things!" she repeated, softly, and the despair faded from her eyes. "Then I will not murmur! It cannot—it shall not be a cross which brings me nearer to Him!"

CHAPTER XXXI.

WHAT THE SPRING BROUGHT.

It was the springtime again—the lovely April month, beloved of poets and painters, half-laughing, half-sorrowful, with its mingled tears and laughter. In the northern counties the chilliness of the past winter still lingered; but in the favored south the air was soft and balmy, and the country was at its fairest. The grass and the moss took their brightest coloring; the trees donned their spring attire; the hedgerows brightened into variegated masses of flowers, and the violets and primroses were abundant.

At no place did the sweet springtide come in fairer loveliness than at Slovale, and Jean was too ardent a lover of nature not to feel soothed and calmed by the beauty around her; but her heart was too heavy to know any real happiness. The time was gone by forever when she would have enjoyed a long ramble through the lanes, and have filled her hands with the violets and primroses, with a child's pleasure in their sweetness—a child's delight in the mere physical pleasure of air and sunshine; and her eyes would go longingly after the rosy children as they scampered by her house with their floral treasures.

But the springtime which brought primroses, and violets, and wood-anemones, and snowdrops to the village children, was to bring to Jean the blessing for which she craved, and after the long weary months of gloom, the sunshine was shed upon her life once more.

The French windows of the little drawing-room of Bellevue were open, and the bright April sunbeams, as they played over the pretty velvety lawn and on the flower-beds, gay with many-colored spring blossoms, glinted in through the long lace curtains, and touched Jean's graceful head with a soft, lingering tenderness, as she leaned back in a low chair, looking out dreamily over the beautiful grounds. Her book lay open on her knee, but she was not reading, and she was so lost in her day-dream that she did not heed the opening of the door, and the intruder came softly in and stood watching her for some minutes unperceived.

Suddenly she looked up and recognized him—recognized him with a little cry of joy which broke from her lips as she rose.

"Archie, Archie, Archie!" she cried out, and threw herself into his outstretched arms with a joy which told him that he was welcome beyond all words.

"Ah! Jeanie—you are glad," he said, with a tender smile. "Your face says it plainly, and you need not try to deny it."

"You knew I would be glad, Archie," she answered, struggling for calmness. "And I am glad—how can I help it—when I have longed for you with such a bitter longing!"

"And yet you sent me away, Jeanie," he said, with tender reproach.

Her face shadowed over.

"I welcome my friend," she said gravely, and she drew herself out of his arms, and motioned him to sit down.

But Lord Ivor laughed softly, and took possession of her again

"I am not come as your friend," he said, with his eyes on hers. "Do you remember what you said, my darling?"

Her eyes sought his in startled questioning.

"Are you able to hear good news?" he said, tenderly. "Jeanie, I think I am the happiest man in all England," he added, with irrepressible gladness.

"Tell me," she said, faintly.

He put her into her chair again, for she was trembling and very pale, and taking his seat beside her, he clasped both her hands tenderly in his.

"Listen, darling" he said, softly. "When you sent me from you, you told me that on one condition only would you listen to the prayers I addressed to you; that your innocence should be clearly proved before all the world. It is so now Jeanie!"

She grew white to her lips as she listened, but her eyes, with their silent entreaty, urged him to continue his story.

"The unhappy woman has confessed all, my darling. I mean Emily Brett," he went on, tenderly "She has never known peace, she has never known happiness since and her remorse has eaten into her heart, until she could keep her secret no longer."

"Emily Brett!" came from the white lips.

"Even so, love, Sir David suspected her from the first, and I was determined to know the truth. Fear of discovery was ever before her, remorse preyed upon her, her health decayed under the pressure, and when she found death was near, she sent for me and confessed all. It seems that she had loved the unhappy man whose death lay at her door; that he had promised her marriage; that when she found him lost to her she resolved to revenge herself upon him; and she hated you—because you had supplanted her—bitterly enough to make suspicion fall upon you. It is all clear now, my darling; I have put the confession into Sir David's hands; he has taken the necessary steps to make it public, and you are cleared for ever from a shadow of doubt."

For a moment she did not answer or speak to him, but sat watching his face with dilated eyes; then a merciful flood of tears came to her relief, and with a murmur of thanksgiving, she let her head fall upon his breast, and wept away the last bitterness of the cloud which had overshadowed her life so long.

"My darling," whispered the Earl, after a long silence, as he stooped to touch with his lips the closed eyelids, and kiss away the tears which still glittered on the long lashes, "have you nothing to say to me?"

"Could I find words to thank you?" she said, with her eyes hidden. "I can guess all you leave unsaid, Archie. You have sought to prove my innocence, and so it is proved."

"It may be so," he said, smiling. "I do not say it is so; but if it be, my darling, it was in the selfish hope of a reward. Will you deny it me still, Jean?"

She stole her hand up round his neck and clung to him, feeling as if this hour repaid her for all her suffering. The silver lining of the cloud was turned outwards now, the future rose before them with its rainbow of hope and joy, and as Lord Ivor pressed her to his heart, and his lips trembled on hers, he knew that she was his own again—for ever—for the love wherewith they loved each other would not end with life, but would live beyond the grave.

* * * * * * *

There is but little more to tell. Happiness has no history, they say, and after the long course of misery came a perfect feast of joy. For many years neither has known anything but joy and pleasure; but the shadow that had fallen upon their lives had taught them how to endure—no mean lesson! Until a swimmer has breasted the waves he cannot tell his strength; until a soldier has been in battle his courage cannot be proved; until adversity comes upon us we

cannot tell our powers of endurance; until we have passed through the blackness and darkness of the storm we do not know how pleasant it is to bask in the sunshine—the dark days only enhance the brightness of golden ones, if we do not let the dark days embitter us—and these two of whom I write had borne calamity bravely and nobly, and borne it with a heroism and courage which had ennobled both lives. She was worthier of love than she had been in the early sunshine of her shadowless youth, and he was better able to appreciate the heart which beat only for him.

Standing there together in the blissful consciousness of mutual love, all the bitterness of the past fell from around them, and as she rested in his arms, a ray of sunshine stole in through the window and fell upon them where they stood—it seemed as if it touched them with divine benediction—as if angel hands passing had been laid upon them, and angel voices whispered a prophecy of peace and happiness, which was fully carried out in their future lives.

THE END.

SKETCHES OF GERMAN LIFE.

BERTHA A. WINKLER.

A Festival.

THROUGHOUT the vine-growing region of Germany each village celebrates the "Kirby" three days of general rejoicing and merry-making in the latter part of October when its vintage bargains with the wine merchants are closed, old debts paid, new ones not yet contracted, and everybody supposed to be in a good humor. The old folks laugh and crack jokes over their wine glasses and the young work off their exuberant spirits in dances and games that the national Thanksgiving Day, which follows soon after, may be observed with due solemnity.

Suspecting from the holiday appearance of the garrulous assembly in which we suddenly found ourselves the objects of curiosity instead of *vice versa*, that this festival was in progress, we directed our inquiries to that effect to the buxom, rosy-cheeked girl in waiting who at once burst out in enthusiastic affirmatives of "Ya! ya! morgen wirds losgehen!" In imagination already enjoying the prospective waltz she presented, with her flushed cheeks and sparkling eyes, a most refreshing picture of German beauty and robust health. We could not repress a smile, however, when, glancing askance at our dark travelling skirts, she naively suggested the necessity of wearing some red ribbons if we wished to take part in the festivities

Early the following morning an unusual excitement prevailed in the streets. Girls arrayed in their best ginghams, blue stockings and red or yellow neckerchiefs were standing under the doorway engaged in pinning flowers or ribbons in the hats and coats of their sweet-hearts. About thirty of them all similarly decorated, started arm in arm to meet the band of music which was expected from the city. The roads leading to the neighboring villages were alive with gay arrivals Each group as they appeared in sight were walking abreast, thus forming a single line extending the entire width of the road. The effect of this peculiar fashion, viewed from my window, was singularly beautiful. Line after line of gayly dressed forms and flying ribbons rose from behind the hills and, as they drew nearer, swinging their hats in token of recognition and filling the air with song, those already arrived greeted them with a thrilling, sonorous song of "Willkommen Kameraden, etc." (Welcome comrades!)

Shortly after the arrival of the band of music which was the commencement of the festivities, we descended to take a view of the ball-room now gaily festooned with evergreens. Already the dancers were whirling around on the highly-polished floor and performing gymnastic feats without the least inconvenience to their partners. During the intervening pauses eating, drinking, and smoking is the rule, and after listening awhile to the clatter of plates, loud laughter, and still louder calls for the "Kellner" who was frantically rushing to and fro with a dozen glasses in his hands, we were glad to grope our way through thick clouds of tobacco smoke and beat a hasty retreat by the back door where a motley crowd of urchins were standing on tiptoe or by turns assisting each other in climbing up to the window for a glimpse of those wonderful "musikaners" within.

Among the out-door sports which we witnessed with much more pleasure in the afternoon, the foot-race is, perhaps, the most excitable and amusing. Not less than 10, and sometimes as many as 30, young girls, all dressed as nearly alike as possible appear on the ground, where a number of small-sized wash-tubs, filled to about four inches from the rim, stand in readiness for them. At a given signal from the judges, who first see that the tubs are all of one size and contain the same quantity of water, these girls simultaneously swing them on their heads with remarkable ease, and with arms akimbo await the second call, at which they promptly start. For a few paces they generally keep within even range. But gradually the line is broken; some one quickens her steps, the others follow suit; then there are some sudden standstills as the water begins to drip over the rim, and not daring to support the tub with their hands, a dexterous jerk of the head, a quick backward movement, and tub and water are sent splashing into the road. With this manœuvre they have saved themselves a good drenching and disgrace. Meanwhile, the remaining contestants, after a close walk, have left two more behind in the same unfortunate predicament. The attention of the spectator is now directed to the foremost two, who still maintain even pace and a steady equipoise; but their flushed cheeks and compressed lips indicate their internal excitement. As they neared the goal, their speed doubled. One was now ahead and greeted with shouts, the other made a desperate effort, but in vain; she arrived only in time to empty the turbulent water at the judge's feet. The foremost was then presented by the judge with a wreath; the victor of some other game, after presenting her with the handkerchief he has received as a prize in his game, carries her off as the queen of the day, amidst the shouts and huzzas of the admiring spectators.

Balancing heavy burdens on their heads is considered a necessary accomplishment, and encouraged as such in all their out-door sports by offering prizes to the winner. I have seen women carry a large basket full of eggs on their heads, and one of butter and cheese on each arm, to the nearest town, a distance of five miles, with comparative ease.

During the entire three days in which the games and merrymaking were continued with untiring enjoyment, we could not report a single case of drunkenness or misconduct. They seemed like overgrown children, whose hearts, mirrored forth in laughing, joyous faces, seemed bent upon nothing but play. And to one who has witnessed their mode of life during the rest of the year, there is nothing more refreshing than to see these people, after the hard, incessant labor of spring and summer, suddenly break loose, like children from school, to enjoy a series of exhilarating fetes and frolics which would cure the most hopeless hypochondriac. It was, therefore, with some regret that, on the even of the third day, we saw the last ribbon of the departing friends flutter out of sight and heard the faint echo of "Comrade, adieu," with a thrill of sadness which the surrounding village boys, vainly searching their empty pockets for crumbs of cake, expressed far better in their rueful faces and the half-spoken wish, "wenns immer so war!"

BEER WILL NOT INTOXICATE?

I HAV finally cum to the conclusion that lager beer as a beverage is not intoxicating

I have been told by a German who drunk it all nite long, just to try the experiment, and was obliged to go home sober in the morning. I have seen this same man drink eighteen glasses, and if he was drunk it was in Germân, and nobody could understand it.

It is proper enuff to state that this man kept a lager beer saloon, could have no object in stating what was not strictly thus.

I believe him to the full extent of my ability. I never drank but three glasses of lager in my life, and that made my head outwist as tho it was hung on the end of a string, but I was told it was owing to my bile being out of place; and I guess that it was so, for I never biled over wus than I did when I got hom that nite. My wife thot I was goin to die, and I was afraid I shouldn't, for it seemed as tho everything I had ever eaten in my life was coming to the surface; and I believe that if my wife hadn't pulled off my boots just as she did, they would hav cum thundering up too.

O, how sick I wuz! 14 years ago, and I can taste it now.

I never had so much experience in so short a time.

If any man shud tell me that lager beer was not intoxicating, I shud believe him; but if he should tell me that I wasn't drunk that nite but that my stummick was out of order, I shud ask him to state over a few words just how a man felt and acted when he was set up.

If I warn't drunk that nite, I had some ov the most natural simtums that a man ever had and kept sober.

In the first place it was about 80 rods from where I drank the lager beer to mi house, and I was jest over two hours on the road, and a hole busted through each one of my pantaloon neez, and didn't hav any hat, and tried to open the door by the bell-pull and hiccuped awfully and saw everythin, in the room trying to get round on the back side of me, and, sitting down on a chair, I did not wait long enough for it to get exactly under me when I wuz going round, and I set down a little too soon and missed the chair about twelve inches, and couldn't get up soon enough to take the next one that come along; and that ain't awl, my wife sed I wuz as drunk as a beest, and, az I sed before, I began to spin up things freely.

If lager beer is not intoxicating it used me most almighty mean, that I know.

Still I hardly think that lager beer iz intoxicating, for I hav been told so; and I am probably the only man living who ever drunk eny when his liver was not plumb.

I don't want to say anything against a harmless temperance beverage, but if ever I drink eny more, it will be with mi hands tied behind and mi mouth pried open.

I don't think lager beer is intoxicating, but if I remember rite, I think it tasted to me like a glass of soap suds that a pickle had been put tew soak in.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

LEARNING TO REST, OR HEALTH WITHOUT MEDICINES.

"I CANNOT heal you with medicines," said an old physician. "It is rest you need. It is useless—nay, worse than useless—it is folly for me to dose you with medicine, if you are not going to do your part to maintain your health and spirits. Here you are at 28 worn out and literally tired to death, when you ought to be in the bloom and freshness of life. 'Died of exhaustion' might be the truthful verdict of a very large proportion of deaths among the female population of America. Go, take air, rest, sunshine, and though it may be years before you are well, you have so much sinned against nature, you may, with care, be tolerably comfortable."

She replied: "If I have overestimated my endurance it was because I thought to economize by it, and the air and sunshine I have had, because I felt I could not live without it. Why, Doctor, I have done all the errands for my house, bought every pound of groceries, every lamp-chimney, attended to every individual want of my family for years; bought everything that has been required or consumed by the family, and that, of course, gave me out-door exercise."

"Yes, of a certain kind; but that was work, not healthful, reanimating exercise. Now, I am going to give you some kindly as well as professional advice. Suppose you change the order and character of your work. Don't be such a slave to your needle. It is foolish, and would be wicked for you now to continue it.

"If you have the means, and wish to indulge your tastes, as all women do, for fine needle-work on your own and your children's clothes, and can afford to pay some one who has more need of money and less of rest than you, surrender the work and the money, and you take the rest. You can then do with less sewing, and take more sunshine. Be not so careful and troubled about much sewing; cultivate the habit of resting when you feel tired and worn. Rest is not idleness; it is oftimes only change. Cultivate your flowers and your neighbors. Go out frequently, in a social way; it will give you something pleasant to anticipate, and something pleasant to remember. Don't be willing to give up your social position, keep the friends you have now, your children will want them for their friends by and by. You want social position to give them, too, with their other inheritance, so don't sacrifice that or your old-time friendships. Open your piano, furbish up your music, resolve to be less of a drudge in private, and more of a social help. Take hold of the little interests of your town, become more public-spirited, do good with your whole soul, in a general way, instead of burying yourself and living beneath the load of your own selfish cares. Do not infer that I counsel you to neglect any of the delicate little attentions of the home-life—not I. But a delicate oversight of the household economy will oftimes answer as well, you know, as more laborious efforts; only, live more in the outside world, and in a short time your load will have lightened wonderfully, and you will be able to laugh with the best of them."

"This," said a cheerful laughing little woman "is the medicine an old doctor gave me, and I give it you, testifying that it helped me more than any potion I ever took. I began to feel that I had been both wicked and selfish to neglect and make of no avail accomplishments which had cost my parents money and self-denial. It set me thinking. Work is elevating, but drudging is ignoble, and every woman must guard against this latent propensity to drudge. It is the custom to saddle all our physical ills upon the present era, but it cannot be questioned that constitutional disease is as often hereditary from over-work and exhaustion on the part of our parents as from any other cause. There is truth in the old saying of being 'born tired'

"For my part," said the little woman with a happy, ringing laugh. "I'm always glad now, since I'm emancipated, when I think how Christ reproved Martha, I only wonder that I and the rest of 'us Marthas' haven't appropriated that text long ago: "Careful and troubled about much serving, but Mary has chosen that good part which shall not be taken away from her;' which 'good part' consisted not alone in hearing of spiritual things, but also, perhaps, in evincing a disposition to contribute to the social and intellectual advancement of her sex. Now I mean to do my work with honest pride, whatever I find to do, but have my little seasons of social and intellectual recreation each day," said the little woman, as she arose to go.

Ruth Reubens, in Cincinnati Times.

FEMININITIES IN BRIEF.

AN innovation in underwear is seen in fine pink and blue flannel, beautifully embroidered in flowers with white floss; other more costly underwear comes in silk, in such colors as red, blue, rose-color and olive-green. White skirts are no longer worn in the street. Black satin, or Japanese blue, scarlet, or olive-green satin and flannel take their place.

A novelty in dinner cards is that of using silk as a mat upon which the card is sewed. The silk, which should be heavy gros-grain of a bright color, is embroidered with a flower or simple design in one corner, and a card velveted and gilded on the edges, is laid diagonally across. The card should be narrow and the silk fringed for half an inch or more.

Stone china is fashionable and is decorated in marigold pattern, in sage-green, blue and ashes of roses tints.

APPRECIATION OF THE RURAL NEW-YORKER.

Recent Extracts from Letters and from the Press.

THE RURAL NEW-YORKER.—Under date of Nov. 1, the Newbernian, (N. C.) says: "Fifty years ago it was a very common opinion that book-farmers were a flighty and visionary class of men, in following whom, the practical farmer, would come to grief. There is truth in this assertion, for very many visionary men have induced the practical men to carry into execution crude and baseless theories. But at the same time, there were thoughtful and prudent men who made agriculture a study; believing that the cultivation of the soil and the production of remunerative crops should not be given up to the men who had muscle, but no brains. On the contrary, there were a few who believed that the highest scientific attainments combined with experience were necessary to constitute the successful practical farmer. No journal has done more to instruct the farmer and elevate agriculture to the level of science, than the RURAL NEW-YORKER, now in its thirty-first year: a weekly periodical, edited by cautious and experienced men, and giving good and wholesome instruction to all who are engaged in the noblest and most independent avocation in life—agriculture. We have been acquainted for years with this excellent paper; we have read its numbers with pleasure and improvement and we have greatly desired that in every farm-house in our land, a copy of it might be found, well read and thoroughly discussed.

A WRITER in the McMinnville (Tenn.) Herald says:—"I have for the past few weeks had the pleasure of reading that excellent agricultural journal the RURAL NEW-YORKER, and have derived so much benefit from the perusal of its columns, that I feel that I could not do my farming friends a greater service than to recommend it to their favorable consideration. It is certainly one of the very best agricultural journals published in this or any other country, and I feel assured that no tiller of the soil who loves and honors his profession and is interested in its progress would ever regret the subscription price, or after reading it one year, would ever let his name drop from the subscription list. The RURAL NEW-YORKER is a weekly journal, containing sixteen pages, handsomely illustrated, embracing every department of agriculture, and treating in the most satisfactory manner of every subject in which the cultivator of the soil feels interested, therefore it cannot fail to instruct, encourage and benefit him. Such a journal, in the hands of every farmer in the land, would be the most effective cure for the "hard times," and if all such would subscribe for it and study it as they should do, I feel convinced that the "good time coming" would come in on the express train.

GENTLEMEN — Permit me to thank you for the copies of the RURAL which you have pleased to send to my address. I am at the present associate editor of the Indiana Farmer, having charge of the Scientific Department. I need hardly say to you how highly I appreciate your paper, both in the extent of its information and in the general accuracy of its scientific deductions. When in charge of the United States Laboratory at Washington, I had an opportunity to compare the papers that presented farming in its scientific aspect, as they were received at the department; and I found none freer from misstatements than the RURAL NEW-YORKER.

Indianapolis, Ind. RYLAND T. BROWN.

THE Farm and Fireside (Springfield, Ohio) says: "The publishers of the RURAL NEW-YORKER, 78 Duane Street, New York City, are conducting a series of free plant and seed distributions among their subscribers. We have received a sample of the first distribution, and are free to say it is all the publishers claim for it. Ten of the varieties they offer cannot be purchased here or in Europe. They are among the finest hardy plants in cultivation. The RURAL is a wide-awake, progressive journal, and merits a hearty support

MR. J. G. CANNON, Millers, Va., says: "I write to tender you, gentlemen, my thanks for the valuable aid gathered from the rich, practical and instructive columns of your pre-eminently the first agricultural paper in this country. May it continue to lengthen its cords and strengthen its stakes with each recurring year."

"BY the way," says M. L. T. Lovett, of Little Silver, N. J., "you asked me sometime back what you should do to improve the RURAL I must say I have but one fault to find with the RURAL: It is so nearly perfect as to leave but little room for improvement."

I THOUGHT to economize last spring by stopping two weekly agricultural papers, and taking one monthly, but it doesn't pay. As long as I am a farmer I want the RURAL NEW-YORKER.

P. M. SHAW.

Trumansburg, Tompkins Co., N. Y.

I DISCONTINUED my subscription several years ago for the purpose of retrenching, but I find of late that I can better afford to live with it than I can without it. CHARLES SCHWAB.

Seneca Co., N. Y.

PROFESSOR BEAL, of the Michigan Agricultural College, says: "I only hope the RURAL will continue to be as good as it has been for the past two years."

WM. C. L. DREW, of California, says: "I consider the RURAL the Banner Agricultural paper of America, and deserving of support from all quarters."

"WE think the way your paper is conducted now, it is worth all the other agricultural papers thrown together." COLE & BROS.

Pella, Iowa.

MR. W. G. WARING, Tyronne, Pa., says: "My friends are much more than pleased with the RURAL. They use their strongest words of admiration."

MR. R. B. CUTTS of Garrettsville, Ohio, under date of October 22, says: "The RURAL NEW-YORKER saved me $10.00 on my potatoes,"

THE RURAL NEW-YORKER seems to meet with the success that its great energy and ability deserve."—Maryland Farmer.

JOHN S. BOGGE, Laporte, Ind., (and many others): "The seeds received were to us worth far than the price of the RURAL."

MR. WM. ROBINSON, Editor of the London Garden, says: "The RURAL certainly deserves its success."

WE consider the RURAL NEW-YORKER the best paper published. C. M. SILVA & SON.

Newcastle, Cal.

NELSON RITTER (Syracuse, N. Y.) says: "The RURAL stands at the head as an agricultural paper,"

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN-THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

"We may live without poetry, music and art
We may live without conscience, and live without heart.
We may live without friends, we may live without books.
But civilized man cannot live without *cooks*.
He may live without books, what is knowledge but grieving?
He may live without hope—what is hope but deceiving?
He may live without love—what is passion but pining?
But where is the man that can live without dining?"

It was many years since I had read that poem of Owen Meredith's in which these lines occur. "Lucile" abounds in sentiment and romance, and those lines wedged in among such passionate love scenes, cause one to smile at the truth of this confession from such a source. Oh! bride of one, or of fifty years, you have ere this learned the truth of that last line I am sure, for—

"Where is the *man* that can live without dining?"

Does some cynic of the sterner sex add,—or woman either? I reply, that I have noticed in instances when the gentle sex alone inhabited a home, there was less and perhaps too little attention paid to a full. "square" meal. We depend too much on cups of tea, and put ourselves off by way of a *resting* spell, with an easily prepared lunch when the men folk are not with us.

These thoughts were partly brought to my mind by the remarks of a lady in Boston, who, being the wife of a clergyman of wide and well know renown, has had an opportunity of learning a great deal of the domestic life in families.

"My dear" she said, "I hope you use good, respectable hop yeast." I assured her I did.

"That is good; but the mixture called 'salt risings' or 'milk risings' is very unhealthy. The smell, when a few days old, is quite putrid, though the bread, when new, is very white and attractive. Then the saleratus bread with greenish streaks or small, acrid spots all through the unwholesome loaf or biscuits! Yes; I have suffered," she went on. "Pies, rich and indigestible, butter that has managed to retain an endless variety of bad flavors, and is inserted into every dish upon the table! How often have I said in my heart—'not even a dinner of herbs do I crave, but a well baked potato with a little salt, if cooked aright!'"

"But," I ventured to protest—"these are extreme cases."

"There are too many of them still to be found in rural districts," she added, confidently.

I felt as if such a thing must be a mistake, and have been wondering ever since how we could come at the facts; how learn what, and in what manner our rural housekeepers prepare the midday meal. Suppose—taking one ordinary day without any extras—we jot down for each other's benfit the details. We will suppose that all our butter tastes of white clover—but let us tell in what proportion we use it, and if the libel we sometimes hear is true, that fat pork swimming in grease, with few vegetables, forms the staple cooking of a farmer's wife. I think it might be conducive to good if our faithful domestic Economist, Mrs. Maple, would kindly print some of the "dinners" that may be sent in. Let them be *bona fide*; no embellishments, and I think we can prove even to the "Hub," that our food is wholesome and palatably cooked with care and often with regard to hygienic principles, that do credit to us, according to the light that has been given us. And as was remarked with regard to the grand complimentary breakfast lately given the veteran author, Oliver Wendell Holmes, that it was discussed much as all meals must be "even when literary lions are at the table," so we once more repeat—

"Where is the man that can live without dining!"

CHILDREN'S CLOTHING.

BY MARGUERITE.

E. E. K.'s article of December 6th is a good one, and I earnestly wish that all mothers were as sensible in the mode of dress for their children. I tried her method last year and, please excuse my egotism when I say I think I'm a step in advance now. I found the drawers, skirt, and stocking supporters too much for one waist, so I stitched a piece of muslin inside of the waist of flannel chemise, putting on it a button for the drawers. Then I sewed the skirt fast on the waist, putting buttons on each side for the supporters. Recently I have adopted still a better method for wearing the stocking supporters. I took a piece of elastic tape nearly an inch wide, and sewed the ends together, having it go over her right shoulder and under her left arm; another over her left shoulder and under the right arm, coming down below the waist. A single piece was fastened to this, about five inches long, and the stocking supporters are buckled on to it. They work like a charm! Not a button about them, and her clothing is supported by her shoulders, which is the only proper way.

The drawers go into the stockings, extending to the ankle; but on account of their liability to slip up, I knit on ankle-pieces of fine yarn, seaming it; I also knit a heel on it, like a stocking, and a half-instep. The leg of the drawers then are fast, and my little girl of five can dress herself. Another way is to sew a piece on the bottom of the drawers similar to the top of a man's sock. They are more inclined to fit snugly. For the wrists of under chemise-sleeves I knit pulse-warmers and sew them on. I have great trouble on account of my children wearing out the knees of their stockings while the feet are good. I find I can cut the worn parts off, and knit the sound lower parts up. I also have tried knitting the knees double, as one would a double heel, which is an excellent plan. Another good way is to line them across the knees before they are worn.

There is not enough said about the proper ways of dressing children. I visited a baby the other day, that was just beginning to walk. It wore cotton stockings, and had nothing to protect it from cold from its waist to below its knees except the loose dress. The mother was doctoring it for croop, and had had no rest with it the night before. A doctor's bill will probably follow, and perhaps a coffin. Isn't it better to invest in flannel, or Canton flannel, and learn the best way to make the garments? Remember, mothers, your children have to bear the penalty of your ignorance. Because one does not know any better does not clear us. God holds us responsible. I have gained the knowledge I have by study and experience since I became a mother. A little thought on a mother's part will bridge over many a chasm in the family, and many of our parental troubles would cease to exist.

TO KEEP THE CELLAR WARM.

MARY BEAL M'LOUTH.

There is nothing in winter which mars the farm-house more than the unsightly straw used for banking its walls. On bright, warm days it gives off a sour, unpleasant odor, besides furnishing a good foundation for a fire. A house banked with dirt, presents a much more tidy appearance and the banking does not have to be done over again every year. Pack the dirt hard as high as the wall, and then cover with sod, leaving a blank space under the windows. It will settle a few inches. The ground under the windows can be filled temporarily with sand, and a board nailed on to prevent its scattering! I do not wish to recommend anything whereby careless people might get their houses burned; but if families will use every precaution against fire, a stove can be set up in the cellar, just underneath the stove in the room above, and the pipe put through a thimble in the floor, and made to connect by means of an elbow with the back part of the stove-pipe. A little expense will prepare a joint suitable to receive it. It is necessary to have a damper; but one can be made to answer for both stoves. A very little fire is sufficient, but the stove must be very tight. A few brick can be put in front, and all cracks covered with sand. In a cellar that is exposed, a thermometer is sometimes the means of saving the potatoes by warning one of impending danger.

SMALL CHOPPING-MACHINE.

Can any housekeeper help a backwoods' lady to a chopping-machine which will do for a family of three? Of course, I have the sausage-mill, but when I have a *little* meat or cold fowl—just for one dinner's relish, perhaps—I don't want to be troubled with that machine. I have a chopping-board and knife, both big and heavy. But is there no machine for chopping a little meat without needing an hour's work to clean and fix up when done? I like *minced* meats, but they are almost unknown at our house, because of the trouble of preparing them. Now is there any contrivance to help me out—something that won't cost a great deal, either of money in the beginning or of time and patience in the end. If there is nothing of the sort, won't some ingenious Yankee invent one? I wish he would. MRS. S.

North Carolina.

DOMESTIC RECIPES.

Escaloped Chicken or Turkey.

Chop fine any cold fowl and season with pepper and salt. Moisten bread-crumbs with a little milk, butter a baking-pan, put in a layer of crumbs, then a layer of meat, and so on, until the pan is full. Beat up two eggs, add half a cup of milk, any gravy or dressing that has been left, thicken with bread-crumbs, season with butter, pepper and salt, spread over the top, cover, bake three-fourths of an hour, then uncover and let brown.

Orange Merinque Pie.

The beaten yelks and whites of three eggs, grated rind and juice of three oranges, four table-spoonsful—or more, if liked very sweet—of sugar, one table-spoonful of melted butter. Cream the butter and sugar, add the beaten yelks, then the juice, rind and whites; bake with an under-crust. When done, beat the whites of two eggs to a stiff froth, add two table-spoonsful of powdered sugar and spread over the top, and return to the oven to brown. MARY B.

QUESTIONS ANSWERED.

Sugar-Cured Hams.

Please give directions for the above.

MRS. STONE.

ANS.—Allow the hams to stand until the animal heat is entirely out of them, then rub well with common salt and leave them in a cask for two days, turning over twice a day. Take out and, for hams weighing from 12 to 14 pounds, take for each, three-quarters of a pound of common salt, the same quantity of brown sugar, one ounce of powdered saltpeter and a teaspoonful of cayenne pepper. Rub first with the saltpeter, then with the salt, after which with the sugar and pepper. All the ingredients should be well rubbed in. Place in the barrel, skin side down, in which they are to be kept, let remain a week, make a pickle of salt and water, strong enough to bear up an egg, add to it a pound of sugar and pour over the hams until covered. At the end of four weeks take out, hang up for a week, then smoke. Hickory wood is the best to use. Smoke at least three weeks.

News of the Week.

MISCELLANEOUS.

Monday, Dec., 29, 1879.

It is rumored on good authority that the United States mission to Russia has been tendered to Gov. Van Zandt of R. I. The Russian is one of the four great missions, and our important and friendly relation with that power give some significance to this appointment. Should the rumor be true, it will leave the field clear for the re-election of Gen. Burnside to the Senate, and will give several anxious candidates an opportunity to enter the Gubernatorial race in April.

A petition has been received by the President, signed by 400 gentile citizens of Utah, protesting against the reappointment of Governor Emery as the chief magistrate for that territory. The reason given is, that he favors polygamy and has approved the repeal of the only territorial law under which polygamy can be punished.

As the refunding act of 1870 was amended last year so as to permit the four per cent. bonds it authorized to be exchanged for any bonds of five per cent. and over as they became redeemable, Secretary Sherman will be able to take up the $18,429,000 six per cent. bonds which come due on the last day of December. There still remain about $103,000,000 of four per cent. authorized by the act of 1870, but never issued; but none of these can be used in exchange for the '81 sixes till the latter are actually due.

Cincinnati, Ohio, Dec. 26, 1879.—The Western railroad rates are likely to be altered. An Evansville Indiana despatch of Dec. 26, says an important meeting of the general freight agents of the Southern and Western Railroad lines will be held there on the 30th inst., relative to rates to the southeast coast, regular green line points and routes via Baltimore and New York. The Southern interests, it is understood, will prepare for war on the steamship lines and combinations that have forced the coast freights round by Baltimore to Charleston by ocean. Messrs. Stahlman of the Louisville and Nashville; Knox, of the Nashville and Chattanooga; Frink, of the St. Louis and Iron Mountain, and Babcock, of the Evansville, Terre Haute and Chicago, have been in correspondence and twenty representatives are expected.

A monument has been erected over the neglected grave near Lincoln City, Ind., of Abraham Lincoln's mother, Nancy Lincoln, who died in 1818, when Abe was nine and a half years old. The Lincoln family removed from Kentucky to that spot when it was a wilderness in 1816, the year Indiana entered the Union, and there Abraham lived till he was 21 years old. Studebaker, the great wagon-maker of South Bend, Ind., was chiefly instrumental in having the mother's resting-place cleared of its tangled undergrowth and a marble stone provided to mark the spot.

Congress adjourned last week for the holiday recess. The chief things of interest during the last two days of the session were a debate in the Senate led off by Voorhees of Indiana, on his resolution to investigate the negro exodus from North Carolina to the State which the senator represents, and which was passed by the aid of republican votes, and a debate in the House over the Ute question, which, however, led to nothing definite. A number of prominent republicans are said to have formed the New Orleans Ledger publishing company, to publish a republican newspaper, the first number of which will appear January 3. Ex-Gov. Michael Hahn will be president of the company and editor-in-chief.

A motion was submitted by Senator Edmunds in the United States supreme court last week, to advance upon the docket the case of Augustus D. Juilliard against Thomas S. Greenman, which now stands No. 779. This is a test case, brought to obtain the opinion of the court as to the validity of the act of Congress of May 31, 1878, forbidding a further retirement of the so-called United States legal-tender notes, and requiring them to be reissued and kept in circulation after redemption. Dennis Kearney talks of nominating Thurman as the workingmen's candidate for president, in the hope of a democratic indorsement. Dennis is now on his way to Boston.

President Leland Stanford of the Central Pacific road intends to plant every tree, shrub and vine that will grow in California on an arboretum of some 300 acres, which he has set apart for that purpose on his Menlo Park estate near San Francisco. He has just bought 1231 kinds of plants and he intends to give a practical test of his belief that California will grow a greater variety of plants than any other country in the world.

The surrender of the guilty Indians is still doubtful. A dispatch from Los Pinos agency, Col., datdd Dec. 26, says that "Ouray and the chiefs selected to go to Washington came to the agency yesterday, bringing with them only a part of the prisoners. General Hatch refused to go unless all the prisoners demanded by the commission were surrendered. Ouray asked for further time, and five days more were granted to deliver them at Cline's ranche, thirty miles from here, on the road to Animosa, at which place General Hatch will await their coming. Ouray is either playing a double game or is unable to accomplish what he attempted.

The snow is from five to fifteen feet deep on the range, and the general is compelled to build a sleigh in order to make the trip. The success of the commission is somewhat doubtful, and the army may yet be called upon to settle the Ute question."

The next meeting of the Michigan Pomological Society will be held at Hillsdale, February 11th, 12th and 13th.

FOREIGN.

The cold in Europe continues severe. . . Trouble is feared among the boers of Transvaal, South Africa. This Dutch colony was some time ago annexed by Great Britain, and the original settlers don't like the present government. . . Business is remarkably brisk in Great Britain, in all branches, but especially in the iron department. Strikes, of course, are multiplying. . . The emancipation of Cuban slaves has been decreed by the Spanish cortes, only a handful of opponets voting against the measure, and these chiefly representatives of "The Ever-Faithful Island." Students at Russian Universities will in future be subjected the most rigid military discipline. . . . Accounts vary somewhat with regard to military operations between Chili and the allies, Peru and Bolivia; but the balance of success seems on the side of the sturdy Chilians, who have invaded Peru lately and won several victories. All farmers are interested in this struggle, as in case Peru wins, she'll have a monopoly of guano and nitrates, her object in figbting.

There has been another Cabinet crisis in France. The present Ministers have all resigned, but no successors have yet been found for certain who can command a majority of the Legislature. The new Cabinet is certain to be anti-clerical, more radical, favorable to general amnesty of imprisoned Communists, and, on the whole, an advance towards extreme republicanism. . . The Russian Government seems to be inclined to recede from the extreme measures of repression it appeared to contemplate against revolutionists immediately after the late attempt upon the life of the Czar. We are now assured that liberal measures will be soon inaugurated. In spring the Russian empire will, it is said, be extended eastward, by the capture of Merv, and also of Herat in Afghanistan. The English, however, will probably anticipate the Russians in case of the latter. . . The condition of the British forces in Afghanistan is rather critical. The natives have everywhere risen to arms, and the various detachments of English troops are pretty nearly all surrounded. That under Gen. Roberts at Cabool has been forced to quit the city, and for some time was besieged in the neighborhood; but by the latest accounts it seems he has defeated the enemy, and having plenty of provisions expects to hold his own at least until spring, when the necessity of planting their crops will force the warlike hill tribes to return home. . . There are various reports, some of them true, no doubt, and others sensational, of a grand rising of the Mahommedans of the East against British domination. It is said to have begun in Afghanistan, and to be likely to spread to British India. Considering that the number of Mahommedans exceeds that of Christians of all denominations, such an uprising would be formidable, as nearly all of them are in Eastern countries. But there is little fear of anything more than a local excitement. . . Bismarck is again reported sick. . . The French Government has proposed a plan for the settlement of the Turko-Grecian boundary, which is expected to be satisfactory, and so a threatening war is averted. . . More Russian Nihilists have been arrested in Berlin and Florence. Not content with conspiring against the Czar, they are also accused of concocting schemes against the government of the countries that give them a refuge. . . Another insurrection in Mexico!—this time in Lower California.

EGGLESTON TRUSS CO.—*Gents:*—I was in your office a few weeks ago and was fitted with a Truss. I can say it is the best Truss I have ever used. Has not troubled me one bit since it was put on. I have not had the Truss off but once since you put it on, and that was this morning. The intestines did not come down, so I know I can soon take it off altogether. Then I shall walk the earth a free man, after 20 years of bondage and suffering. No money would induce me to be placed

back where I was a few weeks ago, unless I could get one of your "Sensible Trusses."

Yours truly, A. KIMBALL.

Marengo, Ill.

A great medicine in small vials.—Dr. Pierce's Pellets (little pills). No cheap, paste-board or wooden boxes, that allow a waste of strength. Sick headache, dizziness, rush of blood to head, bad taste in mouth, billious attacks, jaundice, internal fever, boils and nettle rash. Sold by druggists.

CURE FOR COUGH OR COLD.—As soon as there is the slightest uneasiness of the Chest, with difficulty of breathing, or indication of Cough, take during the day a few "*Brown's Bronchial Troches.*"

All your own fault if you remain sick when you can get Hop Bitters that never fail.

The Markets.

THE GIST OF THE MARKETS.

IT will be noticed that all over the country prices of agricultural products are at present stationary or nearly so. The slight variations in prices from those of last week, noted in the various markets, are not greater than those that often take place from day to day, or even in the course of a single day's transactions. Indeed so long as inducements to exportations continue so uninspiring as at present, little advance can be expected in cotton, breadstuffs and provisions, as all three of these are now held at higher prices in the domestic than in the foreign markets. There is therefore no inducement to ship, or to pay higher prices here with the effect of adding to the enormous accumulations already in the hands of dealers and speculators. To-day (Saturday) freights on the fleets of European steamers leaving this and other Atlantic ports, are lower than on any day during the year, owing to the unwillingness of produce dealers to ship at present transatlantic prices. In the European markets the impression prevails that prices here must come down somewhat, and at any rate the present figures there are high enough to tempt the export of grain from all other countries having a surplus of it. American speculators think the supply from that source will soon be exhausted, and that then they can demand their own figures.

Wool, despite the slackness that always marks the trade towards the close of the year, is still firm, with a slight upward tendency, if anything. At the present rate of consumption the stock on hand will be used up before the new clip, and prices abroad are so high as to render importation unprofitable, unless prices fall there or rise still more here.

The strike of working hog packers in Chicago, besides inflicting a great deal of harm on the trade of that city, has had a depressing influence on prices elsewhere, as much of the stock that would naturally go there, has been diverted to other markets, adding there to the usual supply, while the demand can be only slightly increased, if at all. By wise municipal precautions, no violence has been yet committed among the Chicago strikers, and it is to be hoped, for the sake of all parties, that the unfortunate suspension of work may soon be over.

By mail advices of December 15, we learn that the grain trade there was unsatisfactory to English farmers, as the price—46s, 7d per quarter—was too low to be profitable, and they were urged, therefore, to use every effort to raise it to at least 50s. American red winter wheat was 10s. per quarter—or 25c. a bushel—higher than the average wheat of home production, the disastrous want of quality in the domestic grain being responsible for this. Little change was expected before New Year's, as dealers dislike to incur obligations to be met then. The following comparison of prices of wheat in different markets will be interesting:

	December 1.		December 11.	
	s.	d.	s.	d.
Paris	57	0	59	9
Marseilles	55	0	56	9
Berlin	49	8	50	7
Hamburg	49	2	50	0
Amsterdam	50	0	52	0
New York	50	0	53	0
San Francisco	57	5	58	5
Alexandria	43	0	43	0

The prices are in shillings and pence English, the measures in quarters of eight bushels.

The Mark Lane Express of the 25th, in its review of the British grain trade, says that owing to frost, wheat sowing must be deferred indefinitely; the distress is increasing in agricultural districts; cattle are suffering severely; thrashing is steadily progressing; provincial grain trade has been slack owing to disinclination of millers to increase stock until after the holidays. Prices of all cereals were firm, except maize which sold at a slight reduction. Some fear was entertained that those countries having a surplus of wheat, might imitate America and put up prices. Imports had fallen off considerably, and there was an effort to substitute cheaper wheats instead of American red winters and springs.

SPECIALS FROM ALL CENTERS.

Until Saturday, Dec. 27.

Baltimore.—During the week there has been a slight fall—from 1½c. to 3c.—in all grades of wheat, both for cash and future delivery; in corn also there has been a slight fall—from ½c. to 1½c.; oats, rye and hay are unchanged. WHEAT—Southern red at $1.40@$1.45; do. amber at $1.50@$1.55; No. 1 Maryland at $1.55½; No. 2 Western red, spot and December at $1.52⅞@$1.52¾; January $1.53⅞@$1.53⅞; February at $1.58⅝@$1.58¾. CORN—Southern white 62@65c.; do. yellow 58@60c.; Western mixed, 59¾@60¾c. OATS—Southern at 47@48c.; Western white at 47@48c.; do. mixed at 45@46½c.; Pennsylvania at 47@48c. RYE—$1 00. HAY—Prime to choice Penn. and Md., $17@18. BUTTER—Prime to choice Western packed at 23@25c.; roll at 20@24c. EGGS—Fresh at 21@22c.; limed at 16@17c. COTTON—Middling, 12¾c.; low, 12¼c.; good ordinary, 12c. Gross receipts for week, 5,396 bales; exports, 1,337; sales, 751; spinners, 250.

Boston.—Since last report corn, oats and rye have been steady; shorts have gone up $1.00, and fine feed and middlings from $1 00 to $1,50; cotton is a shade lower. Supply of Western cattle lower than for some months; quality mostly of ordinary grade; prices fully ½ higher than for the same quality a week ago. CORN,—new, 62@64c.; old, mixed and yellow, 65@67c. OATS.—No 1 and extra white at 51@54c; No. 2 white at 50@50½c; No. 3 white and No. 2 mixed at 48@49c. RYE—95c@$1. FEED—Shorts at $19; fine feed and middlings scarce at $19.50@21. HAY—Choice, $16@$17; poor to ordinary, $11@15; rye stray, 24@25; oat straw, $10@12. COTTON.—Middling 12¾c; low middling 12¼; good ordinary, 11⅞; gross weekly receipts, 11,921 bales; exports, 2,788.

BRIGHTON CATTLE MARKET.—BEEF CATTLE, per 100 lbs. live weight, extra quality, $5.62½@5.87½; first quality, $5.12½@5 50; second quality, $4.62½@5.00; third quality, $4.25@4 50; poorest grades of coarse oxen, bulls, etc., $3.25@4.12½. MILCH COWS—Extra, $45@$70; ordinary, $20@44; farrow cows, $13@$27; springers, $18@$45 ₰ head. SHEEP AND LAMBS A better demand for sheep than a week ago. Western costing 5c @5c.; Northern lots at 4c.@6½c. SWINE—5½c.@5¾c.

Buffalo.—During the week wheat has risen from 1 to 3c. per bushel. Corn has had a pretty heavy fall of 10c.; No. 2 Western oats, steady. State, a decline of 1c.; barley steady. Of cattle the weekly receipts were 5,447 head against 10,700 the previous week; demand light, but prices somewhat higher, owing to diminished supply. Sheep active and firm. Hogs somewhat higher; receipts 17,580. WHEAT.—No. 1 Duluth Spring, $1.43; No. 1 hard 41,190 the week before; market active and higher. Duluth at $1.45. CORN.—New No. 2 Western held at 50½@51c; old held at 53@54c. OATS.—No. 2 Western, 45c.; State retailing at 46@47c BARLEY.—Canadian, 70@85c.; State, 65@75c.; No. 2 Western, 90c. RYE.—No. 1 Milwaukee held at 90c. MILLFEED.—Coarse, $15@15; fine, $15@16; finished at $17@18 per ton. CATTLE.—Light, choice steers, $3.65@4.25; steers and cows, $3.60; butchers' cows, $2.50@3 20; common to fair, $2@4 50; good to choice, $4.75@5.40. SHEEP—common to fair, $4@4,50—no lambs offered. HOGS.—Yorkers, $4.90@5; heavy and medium of fair quality, $4.75@4.85.

Chicago.—During the week No. 2 red winter wheat fell 1c.; No. 2 Chicago spring went up 1c. for cash and 2½c. for futures; No. 3 rose 1½c.; rejected, steady. Corn is a shade higher; so are oats, rye and barley. Hogs went up from 15c. to 30c.; but prices are still depressed by the continuance of the strike, most of the packeries having closed down entirely, or being run short-handed. A good deal of hogs sold for 50c. to 75c. per 100 lbs. less than was paid for them in the country, making a loss of from $100 to $200 per car-load. Already it is moderately estimated that fully $2,000,000 worth of hogs have been prevented from coming here by the strike, and even if it ends soon, it will be some time before the business here recovers from its effects. The demand for cattle was lively, and prices all round ruled from 15c. to 20c. higher than a week ago. WHEAT—No. 2 red winter, $1.32; No. 2 Chicago spring at $1.32⅜ cash; $1.33⅛ January; $1.31⅞ February; No. 3 do at $1.16; rejected at 98c. CORN—40¾@40¾c. OATS—35c. cash; 35¼c. January; 40¼c. March. RYE—80c. BARLEY—90c. BUTTER—Good to fancy creameries, 28@32c.; fine to fancy, 24@25c.; good to choice fresh made dairies, 20@22c.; fair to good, in shipping lots, 16@18c.; common to medium, 13@15c.; rolls, 16@22c. CHEESE—Good to fine cheddar creams, 12¼@13c.; fair to good flat skims, 11@11½c.; poor to fair, 7@10c., according to quality. EGGS—15@22c., outside price for superior fresh. POTATOES—60@65c. ₰ bushel for Peachblows; 50@55c. for Early Rose. HOGS—Dressed, $5.20@5.35; common to mixed live, $4.40@4.5; choice heavy, $4.60@4.80; Light, $4.50@4.75. CATTLE—Shipping, $3.60@5.10; butchers, $2.00@2.40; stockers, $2.40@3.60. SHEEP—Choice extra heavy fat grades, $4.50@5.00; fair to good do., $4.00@4.40; common to medium, $3.50@3.90; all good stock taken at once.

Cincinnati.—During the week all cereals remained pretty steady, with just a shade of downward tendency; butter rose from 1 to 2c. per lb., and hogs from 15 to 20c. WHEAT, $1 33@1.36. CORN, 40@43c. OATS, 39@40c. RYE, 92@93c. BARLEY, 90c. BUTTER.—Choice Western Reserve, 24@25c.; prime do., 22@23c.; prime to choice, Central Ohio, 21@22c. HOGS.—Common, $3.75@4.15; light, $4.20@4.45; packing, $4.50@4.70; butchers', $4.70@4.75. COTTON.—Middling, 12¼c.; low middling, 11¾c.; good ordinary, 11¼c. Receipts for week, 16,765 bales; shipments, 15,393; sales, 570; spinners, 100 bales

Detroit.—During the week wheat has been steady, with a very slight upward tendency; corn unchanged; oats from ½c. to ¾c. higher; clover seed 5c. lower; hogs unchanged. WHEAT—No. 1 white Michigan, $1.35½ spot, Dec. and Jan.; $1.42 Feb.; $1.45½ March; $1.50½ May. No. 1 Milling $1.34. CORN—No. 1 yellow 49¾; high mixed 48¾; No. 1 mixed 48c.; No. 2 mixed 46c. OATS—No. 1 white 42c.; No. 2 white 39¾; No. 1 mixed 40¾; No. 2 do. 37c. CLOVER SEED—No. 2 $4.70; prime $5.05@5.10; choice $5.40. DRESSED HOGS—$5.25.

Indianapolis.—Cereals steady during the week; hogs, ditto. WHEAT—No. 2 red strong at $1.35@$1.36. CORN firm at 40@40½. OATS steady at 37½@40c. Hogs quiet at $4.25@4 55.

Louisville.—Since last report wheat has risen 2c; corn is unchanged; oats, 1c. lower; rye steady; cotton, do. WHEAT.—$1.32@1.34 CORN.—White 46c; mixed at 45c. OATS.—White 42c; mixed, 40c. RYE quiet at 91c. PORK $14. COTTON, middling 12c. Weekly receipts 446 bales; shipments, $1,35 stock on hand 3,111.

Milwaukee.—During the week there has been a very slight advance in most grades of wheat; corn has been steady; oats, ditto; rye, 1c. higher, and barley 1½c. WHEAT—No. 1 Milwaukee hard $1.31¾; do. soft $1.31¾; No. 2 Milwaukee $1.30⅝ spot and Dec.; $1.31¾ Jan.; $1.33¾ Feb.; No. 3 do. at $1.15¾; No. 4 at $1.08¾; rejected at $1. CORN, scarce and wanted; No. 2 at 40⅞. OATS—No. 2 35c. RYE firm and wanted; No. 1 79¾. BARLEY—No. 2 spring, cash 75¾. HOGS—live, $4.50@4.80; dressed, $5.15@5.20.

New Orleans.—Since last report corn is unchanged; oats 2c. higher; hay about $1 lower, as heavy supplies are arriving; cotton just a shade lower. CORN.—Active and firm at 55c.@58c. OATS, scarce at 50c. HAY, prime $22@23; choice, $25 Pork, old, $13.50; new, $14 COTTON, middling, 11⅞; low middling, 11⅛; good ordinary, 11¼; gross weekly receipts 78,767 bales; exports to Great Britain, 48,564; to France, 12,411; to the rest of Europe, 7,288; constwise, 8,082; sales, 34,500.

Philadelphia.—During the week there have been slight fluctuations in wheat, oats and rye, but prices at the close were about the same as at the end of last week; butter steady; eggs, 2c. higher for Penn, 1c. for Western; cheese unchanged; cotton do. WHEAT—Western rejected, on track, $1.45@$1.47; Pennsylvania and Southern red, on track, $1.52@$1.52¾; Southern amber, choice, on track, $1.54; No. 2 red, in elevator, $1.53. RYE—Western and Penn. at 97c@98. CORN—Old Penn. and Southern yellow, on track, 62@62½c.; Southern yellow, on track, 58¾@59c. OATS—45c. bid, 50c. asked for No. 2 white. PORK—$13.50@$14. DRESSED HOGS, 5¾c@6¾c. BUTTER—Creamery extra, 32@34c.; Bradford Co. and N. Y. extra, 28@30c.; Western Reserve, extra, 23@25c; do. choice, 17@22c.; rolls, Penn. extra, 24c.; Western Reserve, 22@23c. EGGS—Penn. 26c; Western, 21@23c. CHEESE—N. Y. factory, 13@13¾c.; Western full cream, 12¾c.@13c.; do., good, 11c.@12c.; do., skims, 7c.@9c. COTTON—Middling, 12¾c.; low middling, 12¼c.; good ordinary, 12¼c. Gross weekly receipts, 6,699 bales; exports, coastwise, 305; sales to spinners, 1,424; stock, 11,197.

St. Louis.—During the week there has been a rise of 1c. on No. 2 red fall wheat, other grades unchanged; corn about 1c. lower; oats less than 1c. of advance; rye just ½c. lower; barley steady; hogs from 10c. to 20c. higher; cattle just a shade higher. WHEAT—No. 2 red fall $1.35¼@$1.35¾ cash; $1.36¾@$1.36¾ Jan.; $1.40¾@$1.41¾ Feb.; $1.45@$1.46 March; No. 3 do. at $1.25¾ bid. CORN—35¼@35½ cash. OATS—37¾. RYE—$1¼ bid. BARLEY—85@90c. PORK—$13.50. HOGS—light shipping, $4.10@$4.20; packing at $4.25@$4.50; butchers' to fancy. $4.50@$4.60. COTTON—middling, 12c; low middling, 11¾; good ordinary, 11½; weekly receipts, 20,549 bales; shipments, 16,181; 4,117.

Toledo.—Wheat has been nearly steady during the week, with a slight advance on choice grades. Corn has fallen 1c. to 2¾c., and oats 2¾c. Clover seed advanced about 20c. WHEAT—Amber Michigan, January, $1.41; No 2 red winter, January, held at $1.42¾; February at $1.43¾; March at $1.43¾, bid. CORN—High mixed at 42½c.; No. 2 at 42½c., spot; 43c. for May delivery; No. 2 white at 44½c.; rejected at 42c.; damaged at 40c. OATS—No. 2 at 37½c. SEEDS—Clover, prime, $5.10 asked, $5.05 bid.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 27, 1879

BEANS AND PEAS.—The market is weak and unsettled. Holders of strictly choice straight lines will not sell under the extreme, but the offering of good useful stock is liberal and cheap sellers get the business. Green peas steady at $1.80@$1.85; Southern B. E. peas $2.60@2.30 for 2 bu bag: Marrow beans, $1.10@1.40 medium, $1.35@1.55; pea, $1.45@1.75; white kidney, $1.75@2; red do., $1.05@1 85; black, (or turtle soup) $1.85.

Receipts of beans since Jan. 1, 1879, 374,275 bush., against 347,675 in '78; exports, '79, 52,225 pkgs; in '78, 48,926 do.

Receipts of beans for week, 3,656 bush.; exports, 485 pkgs do.

BEESWAX.—Small sales have been made at 24½@25¾. for Western and Southern.

BUTTER.—The demand is fully up to holiday volume, and, with some competition for the finest grades of State, prices are a shade firmer. A good many dairy lines have been broken to fill first-class wants, and bodies and remnants have the medium trade that naturally belongs to Western. Exporters are not taking large lots, but their trade, or, for that matter, any other, is not counted by holders. Western creamery goes mostly for fancy grocers' use, but selected well-made State is not more than one cent below its winter leader. Dairy and factory parcels are not over plenty and sell well up to receipt. Receipts of butter since Jan. 1st, 1,430,339 packages, against 1,277,863 in 1878. Exports for corresponding periods, 36,367,005 packages, and 23,023,732 do. State pails and tubs, small dairy and fresh ends, 28@30c.; best lines, 26@27c.; fair to good, 24@24c; firkin and tub single dairies, choice, 26@27c.; do. fair to prime, 22@25c.; firkins, alone, choice, 24c.; fair to prime, 21@23c.; Welsh tubs, 20@24c.; poor State —@20c.; creamery, finest, 36@37c.; good to prime, 33@35c.; sweet cream, 33@34c.; poor to good, 23@32c.; Western imitation cream, 28@30c.; dairy, fresh, extra, 25@26c.; poor to good, 18@22c.; factory, late made, 23c.; poor to good, 18@19c.; very poor Western, 11@14c.; rolls, 20@22c.

Receipts for week, 18,000 pkgs.; do., exports, 875 do.

CHEESE.—There has been a quiet market as usual during holiday week, with prices without important change.

Quotations are for State factory: Fancy, 13@13¾c.; good to prime, at 11¾@12¾c; fair to good, at 10¾@11¾c.; half-skimmed at 9@10c.; skimmed at 6@8c. Wis. factory: Fine at 12¾@12¾c.; good to prime at 11@12¾c. Ohio factory: Cheddar, fine, at 12¾@12¾c.; do., fair to good, 10@11c.; flat, fine, 12¾@12¾c.; flat, good to prime, 11¾@12¾c.; flat, fair to good, 10@11¾c.; half-skimmed, 9@10c.; skimmed, 6@8c.

Receipts for the week, 19,477 boxes; exports, 16,200 do.

Liverpool cable quotation, 61s. 6d. Steam to Liverpool, 25s.

Receipts of cheese since Jan. 1st, 2,550,890 pkgs.; in '78, 3,172,767 do. Exports, corresponding periods, 128,691,911 lbs.; 136,384,523 do.

COTTON.—Business is interrupted as usual about the holiday period, in the absence of despatches from the other side and the closing of Cotton Exchange. The latest prices were for Dec. 12.55@13.60c.; Jan. at 12.66@12.68c.; Feb. at 12.97@12.98c.; March, 13.24@13.25c.; April, 13.44@13.45c.; May, 13.65@13.65c.; June, 13.78@13.80c.; July, 13.90@13.93c.; August, 14@14.02.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—Trade generally is quiet, and prices not changed. Prices are:

Apples—New North Carolina, at 6¼@8¼c. for fair; 10@10½c. for choice; 11@11¼c. for fancy sliced. Patent evaporated apples, choice, in cases, 15@16c.; do. fair to good, 13½@14½c.; N.Y. State sliced, new, 7¾@8¼c.; quarters, choice, 7@8c.; new southern quarters scarce and nominal; new North Carolina peeled peaches at 17@19c., do., Georgia, 13¼@16½c. Peaches, Delaware evaporated, peeled at 25@28c.; do. unpeeled at 13@14c.; new halves at 8c. Blackberries at 9@10c. for new. Raspberries at 26½@27c. Pitted cherries at 18@19c.

EGGS.—Receipts for the week, 4,950 bbls.; do. last week 5,930 do. Supplies are light and average quality has run better. Some Southern marks bring full prices. Limed selling more freely but not quotably higher.

Near points fresh, doz. 25c.; State and Pa., 22@24c.; Canadian 18@20c; Western, prime to extra, 22@23c.; off grades, 17@18c.; Southern, 23@24c.; State limed, 16@16½c.; Canadian, 15@16c.; Western, 15@16c.

FRESH FRUITS.—The reserve of pine apples is small: as receipts have about ceased, extras are held strong. Poor have sold freely to cheap venders, but the supply hangs large. Pears are not commercially quotable. Prime grapes firm, at $2.25@3.50 for Catawba cases. Florida oranges are not as attractive as in former seasons; many parcels have to be repacked.

Spitz, ₰ bbl., $3@3.50; Baldwin, $2.50@2.75; Greenings, $2.25@2.50; Lady apples, choice, 14@16c.; poor, 6@10c.; poor Greenings and Baldwins, $1.75@2. Cranberries are at a good holding quantity and prices are firm. Cape Cod, fancy, $8@8.50; other Capes and Eastern, $6@7.75; N. J. crates, $1.75@2. Florida oranges, hf. bbl. crates, $2@3.75. Pennuts in good demand. Va. hand-picked, 5@5½c.; ex-prime and other grades, 3¾@4¼c. Hickory nuts dull at 80@90c.; B. walnuts, 52c.; Pecans, per lb, 9¾@10¾c.

FLOUR.—There is a fair amount of business and prices rather better.

Latest sales are at $5.40@5.90 for inferior to fancy superfine State; $5 90@6.20 for inferior to good extra do., odd lots and lines; $6.20@6.35 for good to choice do.; $6.25@6.90 for inferior to very fancy superfine Ind., Iowa, Michigan, &c.; (the latter an extreme); $6.00@6 20 for inferior to good shipping extra do., and $6.20@6.50 for good to fancy shipping extra do.; inferior to about choice white wheat extras, $6.20@7.25; choice to fancy do. at $7.25@8 50; red and amber winter wheat, inferior to fancy trade and family, at $6.10@8; round hoop Ohio, $6 00@6.50; and trade and family brands of do, at $6 60@8.00; the latter rate for very fancy; St. Louis at $6 15@7.10 for inferior to very good extra; $7 15@8.50 for very good to fancy; Minn. clear, very inferior to fancy, at $6.00@7.10; Minnesota "straight," very inferior to fancy, at $6.50@8.00, and patent poor to very fancy, at $7.0@9 25; Canada stock at from $4.25@6.25; city mill extra at $6.75@7.00 for about fair to choice for West Indies (fancy do. quoted at higher figures); do. for England, $6.00@6.50 for poor to very choice; do. trade and family extras, $7.10@8 25. do. for South America, $6.75@7.25; No. 2 at $4.35@5.25 for very poor to very fancy.

GRAIN.—Wheat is active on export account, and closed strong at an advance; latest sales are of No. 1 white at $1.55½@1.56; do., December option, at $1.55⅝; do., January, at $1.56¾@1.57; do., February, at $1.60@1.60¼; No. 2 white at $1.53@1.53¾; ungraded white at $1.55; No. 2 red, 1.59½@1.60; do., December option, at $1.59¾@1.60; do., January, at $1.60¾@1.61¼; do., February, at $1.65¾@1 64¾; ungraded red at $1.51@1.52¾; ungraded spring at $1.42@1.47. Rye is firm at 97½@98c. for State and Canada. Corn has a moderate sale at for New York No. 2 at 64¾@64½c.; do., December, at @61¾c.; do., January, at 62c.; New York steamer mixed at 63¼@63¾c.; do., December, at 63c.; ungraded western mixed at 62@64¼c.; No. 3 at 62@62½c. Oats favor buyers with a small demand; latest sales are of New York No. 1 white at 52c.; New York No. 2 white at 51@51¾c.; New York No. 3 white at 49¾@50c.; New York No. 1 at 50c.; New York No. 2 at 50c.; New York No. 3 at 49c.; ungraded white western at 50c.; ungraded mixed western at 50c.; white State at 51c.; mixed State at 51c.; No. 2 Chicago at 50c. afloat.

HAY AND STRAW.—There is a fairly active and firm market. Shipping hay quoted at 65@70c.; retail lots at 70@80c. for medium, and 80@95c. for prime; clover at 55@60c, Straw at 80@85c. for long rye; 65@70c. for short rye, and 55@60c, for oat.

HOPS.—The movement is very light on export and home trade account, and prices are unsettled. Quotations are for New Yorks, new crop, choice, 38@40c; New Yorks, new crop, medium, 34@36c.; New Yorks, new crop, low to fair, 30@32c.; Eastern, new crop, 30@33c.; Wisconsin, new crop, 30@38c.; Yearlings, 7@18c; Olds, all growths, 4@10c.; Pacific coast, new, 35@40c.; Pacific coast, olds (nominal), 7@12c.; Bavarians, 50@65.

HONEY—The market is steady and that is a point gained for this item as buyers never make frequent visits. W.clover, ₰ ℔, 18@19c.; single comb, larger, pkgs., 14@16c.; buckwheat, 12@14c.; clover extracted, 11@10c.; strained, 8@10c.

POULTRY AND GAME.—Turkeys have had a good sale; geese have had more of the old style holiday hum noted for one or two years past. Fowls and chickens have been neglected, and with enough to call a surplus the market is very low. The West is sending fine samples of fed turkeys this season.

Turkeys, New Jersey and Pa., prime, 12@14c.; State, Northern Ohio and Mich. 12@14 c. other Western, prime, 11@12c.; do. fair to good, 10@11c.; Philadelphia, dry-picked, 14c.; do., chickens, d. p. 10@12c.; do., Jersey, per lb., 9@10c.; do., State and Western, prime, 8c.; fair to good, 6@7½c.; Philada. fowls, dry-picked, 9@10c.; N. J. do., 7@8c.; State Western, 5@7c.; Geese, choice, 9@10c.; others, 7@8c.; Ducks, choice, 11½@12½c.; other, 10@11c. Cooped stock has merely a nominal place; fowls, 7@9c., roosters, 4@5c.; turkeys, poor to prime, 9@10c.; Western, 7@9c.; ducks, 40@75c.; geese, N. J., $1.62@$1.75; State, $1.25@$1.50; Western, 87c.@$1,12.

There has been no rush of game and good prices ruled for Christmas. The market closes fairly strong with favorably cold weather. Season for venison is over.

Wild Ducks, Canvas-backs, Havre de Grace, pair, $3.50; Northern, $3; red-heads, 75c.@1 00; Mallards, 75c.@80c.; Teal, 10c.; Black, 50@60c.; common 20@30c. Quail, trapped, ₰ doz., $3.50@$3.25; Partridges, State, ₰ pair, $1.00; Western, 85c@90c.; Grouse, $1.12@$1.25; Flight pigeons, ₰ doz., $1.25; Rabbits, ₰ pair, 30@35c.; Hares, 30@45c.; Minn. venison, saddles, 13@14c.; other, 12@13c.; whole, deer, 7@9c.

PROVISIONS.—Hog products have been fairly active and firm. Mess pork closed at $13.25@13.35 for December; $13.25@13.35 for sellers' option, old or new, for January; $14.00@14 10 for new do. for do.; $14.00@14 15 for February, and $14.25 for March. Bacon at 7¼c. for long clear and 7¾c. for short clear. Beef at for mess at $10.50@11.00; extra mess at $11.00@12.00; packet at $13.00@13.50; tierced beef, city extra India mess, at $21.00@23.00. Beef Hams at $16,50. Lard—Western steam at $7.80@7.90 for spot lots; $7.92½ for new for January; $8.02½@8.05 for new for February, and $8.12½ for new for March; Stearine at 7¾@7¾c. for Western. Tallow at 6¾c. for prime.

SEEDS—Grass are quiet. Clover is steadily held at 8½@8¾c. for prime to choice; 9¾@9¾c. for extra choice. Timothy at $2.75 for prime.

TOBACCO.—Has not varied in any particular, trade being moderate and prices unchanged.

VEGETABLES.—Potatoes dull and unusually low for the season. White onions too high for quick sales; red and yellow, steady. Cabbage lower, but an early advance is expected.

Potatoes, Nova Scotia Rose, $1.50@$1.62; Prolific, 1.25@1.50; Mercer, $1.25@1.37; State Peachblows, d.-h., $1.75@2; Snowflake, d.-h., $1.25@$1.50; Early Rose, Maine, d.-h., $1.50@1.62; State, $1.37@1.50; do. in bulk, 1.25@1.50; do., Peerless, $1@1.37; N. J., do., 87c.@$1; Sweet potatoes, $3.25@$3.50; squash, marrow, ₰ bbl., 75c.@$1.25; Hubbard, $1.25@1.50; cabbage, white, per 100, $4@5; red do., $5@6; onions, white, per bbl., $3@4.50; red, do., $2.25@$2.50; do., yellow, $2.50@2.75, do., Chester, $1.75@$2.25. beets, $1@1.25; Russia turnips, 75c@87c.; carrots, 75c.@$1; celery, per doz., $1@1.50.

WOOL.—A light business the present week on account of the holidays, but confidence prevailing at late prices. Quotations are for—

Ohio, Pennsylvania, Indiana and Virginia—XXX, 52@55c.; XX, 49@52c.; X, 49@52c.; No. 1, 53@56c.; No. 2, 47@50c.; common, 43@45c.; combing, 55@57c.

New York, Michigan, Indiana and Wisconsin—XX, 43@48c.; X, 45@47c.; No. 1, 50@55c.; No. 2, 46@50c.; common, 40@43c.; combing, 50@55c.

Iowa, Vermont and Illinois—X and XX, 12@46c.; No. 1, 48@52c.; No. 2, 44@48c.; combing, 1@53c.

Missouri, Kentucky and Tennessee—Washed fleece, 46@53c.; unwashed fleece, 35@42c.; unwashed combing, 35@45c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Dec. 27.

BEEVES.—Receipts for the week, 10,381 head; do. last week, 10,552 do. The demand was moderate after the liberal rates of last week for Christmas and holiday show, and Wednesday and Friday had a spiritless market. Prime Kentucky steers quoted extreme at 10¾c., 57 lbs. dress. From that grade down to common the range was 7¾@10¾c.

MILCH COWS.—Business is light the average is as before $35@$60, but when the extreme is made the quality has to be specially attractive.

VEAL CALVES.—Live have sold well; Choice N. J. fair to prime, 6@7½c.; best State, 7¾c.; Mount Hollys 5@7¾c. Buttermilk, 3¾@4¾c.; grass, 2¾@2¾c. Hog dressed plenty, prime to extra, 9½@10½c.; a few at 11c.; common to good, 4@8c.

HOGS.—Receipts for the week, 27,082 head; do last week, 30,376 do. The market is excited owing to small supplies. Prime Ohio hogs were wanted at 4¾@5¼c.; city dressed, 6¾@6¾c. Country pork—[illegible] medium, 6¾@6¾c.; heavy, 6¾@7c. Tenderloins, 8¾@8¾c.

SHEEP AND LAMBS.—Receipts for the week, 20,495 head; do. last week, 27,087 do. Mild weather kept back early buyers, but at the close there is more confidence and an active trade can be reported at 4@6c. Lambs scarce; quoted at 6@7¾c.

Reading for the Young.

MY LABORATORY.

S. RUFUS MASON.

My farm of 80 acres is exactly half a mile long, and a quarter of a mile wide, square corners, a road on the east and north sides. I am so well satisfied that all cultivation must be conducted in a scientific manner, that I have converted the whole of it into a chemical laboratory. I have fitted it up with furnaces, crucibles, retorts, benches, tables, spiders, pots, pans and kettles. I employ as assistants, those who have been actively engaged in the especial business of cultivation from the creation of the world down to the present time; they have vast experience, and are very nearly perfect.

There is, however, a little room for improvement, and I, as the youngest member of the company look after that myself. Our operations are continuous, night and day; hot or cold, wet or dry, we are always at work. I will tell you *what* we do, *why* we do it, and *when* we do it.

As soon as a crop is taken from the soil, we begin. If it is one of small grain, we let the *Sun* and *Rain* act upon the land until the weed seeds have all sprouted, we then turn them under with a plow and then a second crop of weeds comes up, which we leave to the tender mercies of *Jack Frost*, our watch dog, and a deadly enemy to all young plants which venture out late. The plow has thrown up the soil quite loose, admitting the *atmosphere*, which aerates every particle of it and refreshes it, just as a breath of fresh air does the cousins, after a lively tussle with the hoe on a warm day.

As cool weather comes on, *Jack Frost* steps in, he nips the clods and freezes them solid, leaving them so till the *Sun* in pity, warms them up, upon which they fairly dissolve with gratitude, and crumble down before him, reduced to fine soil, suitable for seed growth in the spring.

Gentle Spring brings in her train a little troop of helpers, who in turn moisten, and then dry the earth till it is warm enough for a seed bed. Seeds cannot flourish in a cold, chilly bed, and at this time of year must be well tucked in, and although the *Wind* is one of my most valuable assistants, he is sometimes boisterous, and in the exuberance his zeal, will blow the covering off, so we have to go along the seed rows and *tramp* in the seed, "now, don't you forget it," (how natural it is to use slang right after the word tramp.)

About these days, or a little earlier, we start our *furnaces*. Some of our seeds are foreigners or of foreign descent at least, and from hot countries. They require a very warm bed, and we start a fire with fresh manure from the horse stable, put it in a heap, build a box around it to keep *Jack Frost* out, put on a layer of nice soil, and plant the seeds of cabbages, tomatoes, peppers, melons, cucumbers and tender flower seeds.

This furnace is shut out from my out-door helpers by a glazed sash, admitting only the *Sun*. We don't want *Jack Frost*, we don't want *Rain*, we don't want *Wind*, but we must have *Water*, so we let him in under the sash through the rose of a watering pot. (Oh! my! I hear little Kitty Clover say, "I never heard before of a watering pot that bore roses.") Well, they do.

From this warm bed, the young plants are transferred to flower pots, and thence to out-of-doors, where the *air* and *earth* are warm enough, and enjoy the *spring showers*. These showers are very different from other kinds. They are more gentle, contain more ammonia, and are of a *temperature* very refreshing to young plants, which toss their heads and tiny blossoms up towards the gently falling drops, as if they loved them. As *summer* comes along in its hot, dusty march, the rains are driven away, but, like every good action, they leave a pleasant memory, in this case called *Dew*. The *Dew* comes and waters the plants at night when the *Sun* is away. These *Dews* are more tender and delicate than the *Rains*, more beneficial, more constant, more timely, more gentle, and less powerful. As the delicate *Dew* is merely an imperceptible mist, it has no power to force itself through hard-packed soil, we therefore keep the surface loose and open by constantly stirring it with plows, harrows, rakes and hoes.

You will notice that I have a capital set of helpers; they work night and day, are extremely zealous, and some of them at times over-do the matter, but as a general thing they are good, so I set down their names in italics.

During the latter part of *summer* and early part of *fall*, the *Sun* overpowers all the rest of my workers, the plants turn pale, flowers droop, fruit and seeds mature, and all vegetation passes into the "Sere and Yellow Leaf," and here my most important ally begins his duties. He is called *Decay*, he gathers all the dead leaves, stems and branches, he packs them close to the ground, then *Moisture*, his right-hand man, arises from the *earth*, the herbage turns brown, then black, then crumbles down to a fine unctuous mass, containing all the elements of plant food for next season's crops, and this we call Mold or Humus.

In the late fall and winter, this is attacked by *Jack Frost*, *Wind*, *Sun* and *Rain* by turns, which thus prepare it, and by spring it is *plant food*. My active band of helpers do this sometimes in an irregular way, and at uncertain and unseasonable times, and it is the cultivator's business to interpose and regulate, of which I shall treat fully in another article.

Dodge Co., Nebraska.

LETTERS FROM THE COUSINS.

Dear Uncle Mark.—While reading my letter to-night in the children's department of the Rural, it occurred to me that I never told you of the "China Tree," the seeds of which I sent you. They bloom as I said before, in spring, and are of a lilac color. They form in clusters on a single spray. The leaf is composed of three leaflets, that is, there are three leaves so arranged on the stem that they form one leaf. I have looked my botany through, but I cannot find the name of "China Tree," from end to end, so of course I am unable to tell the botanical name of the tree. I never from childhood to womanhood heard the tree called by any other name than the "China Tree," as I always learned that it had first been imported from China and hence its name. There were some "Refugee Negroes" in my garden this summer, and they recognized the tree at once and exclaimed, "Law, missus, you'se got China Trees up har' I do declar." At the first appearance of the tree from the seed, it looks like a weed, only the color is a lighter green. After awhile it somewhat resembles the Elderberry bushes, but as it grows to maturity, it takes on a dark green. If I had only thought before the leaves fell, I would have sent you one, so you could see what it looked like. Now, with your permission I have a proposition to make to the little cousins, and I want them to vote on it. I love children and would do almost anything to please them, so I propose to write them a story of a little girl I knew well and will call it "Reminiscences of a Little Girl." I will try my best to interest you. The best part of the story will be that it is all true. We will follow her from infancy to womanhood and see what you think of her. I am writing like a "steam engine," for fear baby Fred should wake, for that would seriously interfere with all my calculations. What a splendid paper the Rural is! good print, good paper, and interesting reading matter, it is surely all it claims to be, a first-class journal and family paper, and deserves all the commendations bestowed on it by the Chicago Inter Ocean. Hark! what is that noise? 'Tis baby waking, so good-bye to this letter and all concerned for to-night, and some day we will meet again.

Yours truly,

Marshall Co., Kan. Mrs. M. J. Galpin.

[Let us have the story by all means, I am sure the cousins will all be glad to read it.—U. M.]

Uncle Mark.—The grape seeds were received and carefully planted, and now I am anxiously watching for them to appear above ground. My window-plants, which occupy two windows and number some forty varieties, require much attention, but they well repay me for the trouble in their beautiful foliage and blossoms.

Among my choicest plants are the Oleander and a Calla Lily. The former has been in bloom since last June. I also prize very highly my Madeira Vine, which last summer filled the upper half of a window, and bore a lot of delicate white flowers. On bringing the plants into the house, the first of October, I cut it all down, and now there are several shoots that reach the top of the room, from the window-sill, and have been nipped back a number of times. Having read considerable about the germination of weevil-eaten peas, I thought I would test it, for the curiosity of it; hence, I selected seven that very badly eaten, and planted them in a flower-pot; the result is that four came up looking strong and healthy; two are now making a luxuriant growth in the window, the other two having been pulled up. Emily.

Steuben Co., N. Y.

Dear Uncle Mark:—I am a little girl nine years old. I live in the country. I like to read the Rural, especially the boys' and girls' letters. Papa has taken the Rural longer than I have lived, and most of the time it was the only paper we were taking. I have to go one mile and three-quarters to school. I like flowers. I, with my sister Pearl, should like to join your Horticultural Club. Your niece,

Mason Co., Illinois. Fannie E. Armiling.

Dear Uncle Mark:—I have read the Rural for almost one year, and am very well pleased with it, especially the letters written by the little folks and aunts. Tell Pocahontas that perhaps she has her Oleander in too large a pot. I find they bloom best when the pot is full of roots, then they will not grow so freely. I cannot boast much on my Rural seeds, as the weather was so dry, that but few came up to any good. The tomatoes were splendid. E. Dawson.

Wor. Co., O.

Dear Uncle Mark:—As my other letter was in print, I write again. I received the grape seeds, and am much obliged for them; but they are not coming up yet; I hope they will soon. I live on a farm, and can have my garden anywhere. Our farm is almost level. Had I better select my garden spot on high or low land? I did not have a garden the past year. I will close. Your neice,

McLean Co., Ills. Laura Furman.

The Puzzler.

HIDDEN GROCERIES.

1. Is your watch silver, Sandy?
2. Get me some tape, Essie.
3. Has the course of soup past, Ella.
4. He brought me an apple, but termed it a pear.
5. Ha, ha, Min! Cem eats raw ham.
6. Tell me, Nick, how chowder does taste.
7. Massa de saps agoing to waste.
8. Ah, Asa usage begets forgetfulness.
9. In fastening clothes, pins must be used.
10. Let every tub stand on its own bottom.
11. Do they wash board walks.

☞Answer in two weeks. L.

DIAGONAL PUZZLE.

1. A personal pronoun; 2. To act (reversed); 3, Very small; 4. A lady's name. Primals form a western State. Diagonals form a thought.

☞Answer in two weeks. Little One.

DROP LETTER PUZZLE.

Bl-ss th-m wh-ch p-rs-c-t- ---; hl-ss -nd c-rs-n-t. Fill each blank with a vowel and find one of Christ's glorious beatitudes, found in the sermon on the mount.

☞Answer in two weeks. L. O.

A PYRAMID PUZZLE.

A consonant; To be able; part of a flower; A clown; Centrals form a young animal.

☞Answer in two weeks. L. O.

A NAME PUZZLE.

Place nine female names so as to form a tenth.

☞Answer in two weeks. O.

BRIEFLETS.

The British Medical Journal tells of the successful manufacture of artificial eggs. The Scientific American suggests that incubators be invented to hatch them. . . Mr. Keppler, in Puck, presents the average *plumber's* bill like this: Looking for leak, $25; loss of time looking for leak, $50; making leak larger, $100; studying the size of the leak, $200; making new leaks, $300; assistants, $500; paper for making out bill $600; etc., etc. . . Park Benjamin wants criminals to be killed by electricity instead of a rope. Are not executions shocking enough already?—Buffalo Express. . . The nutritive power of parsnips is higher than that of beets, carrots or turnips. . . The Editor of the California Horticulturist says: "Persuade others, also, to plant gardens, and to make beautiful homes, for this is one of the very best ways in which to brighten the world of men and women." . . The American Cultivator in an editorial calls Alfalfa a variety of Lucerne. They are the same. We show everywhere that it has proved hardy in Canada during several years past. . . Mr. Samuel B. Parsons proposes a National Horticultural Society. . . Prof. Husmann estimates the Elvira Grape as among the best for Missouri. . . Mr. Purdy says: "Take out the grubs; head back the peach-trees; then they will live to old age and bear the best fruit." . . Mr. Beecher thinks that religious papers are no more ready to acknowledge their errors than secular papers. . . Our respected friend, Mr. James J. H. Gregory, says in Land and Home, that the cheapness and availability of kerosene for keeping frost from rooms above ground or below ground is a matter well worthy the consideration of the public. . . We have a little conservatory which, during very severe weather, is not sufficiently heated. An ordinary German student lamp has proved effectual in keeping out frost during such weather. . . And now for a Happy New Year, good readers! Has the Rural promoted the well-being of your home during the past year? We hope so, because it has tried so to do. The way to have many friends is to prove worthy of them. Write to us freely. We will thank you for any suggestions or criticisms. If any question perplexes you, see if we can not clear up the perplexity. If you desire any topic treated more freely than we have treated it, let us know what it is. . . What is the best food to make hens lay in winter, Mr. Ritter? . . The strongest objection to discourtesy and arrogance in argument is that they defeat the very object of the argument. They create distrust, dislike or even disgust.—Mr. Chamberlain in Ohio Farmer. . . The Cincinnati Gazette of Dec. 17, has the following: The Rural New-Yorker is one of the handsomest and most liberally conducted agricultural journals among our exchanges, and it was never so good as at present. We never open its well-filled pages without a wish that our columns were even more numerous and broader than they are, that we might transfer a measure of its good things for the delectation of our readers. . . Considering the distinguished source, we think the foregoing the best compliment of the season. . . The Farmers' Club, of Onondaga Co., declines to take any active interest in the forming of a National Agricultural Society, as former experience has shown that they do not pay for their cost in time and money. . . Restrict the time for the reading of agricultural and horticultural essays at our clubs, State and National Societies to ten minutes. That's long enough for ninety-nine out of a hundred of our orators to tell all they know that hasn't been published many times before. . . Our friend, Nelson Ritter, says that oil meal is the best thing that calves can be fed on, but he finds natives do not do so well on it as Short-horns. . . Mr. Nottingham says that raw eggs will stop scouring.

AGRICULTURAL NEWS.

The next meeting of the Michigan Pomological Society will be held at Hillsdale, February 11th, 12th and 13th. . . On Christmas day Santa Claus whirled down from the pole in the midst of the most widespread cold storm of the year. Away in California, advices to San Francisco from all parts of the Pacific coast tell of an unprecedentedly cold spell. The cold wave reached St. Paul, Minn., early in the morning, and straightway the thermometer rushed down to 40° below zero. At Chicago, the day was the coldest of the season, the thermometer standing about zero all day and dropping six or seven degrees lower at night. Down at Cincinnati, the fall of snow prevented extreme cold, but the thermometer sank steadily all day. At St. Louis, cold set in on Christmas eve, and the thermometer marked seven to eight degrees below zero all the next day. Here some heavy falls of snow showed how extremely filthy the streets were, and added deeply to the universal slush; but the weather, while wretchedly uncomfortable, was not cold. All over the north, however, the cold wave is reported to have prevented a green Christmas. . . The annual meeting of the Ayrshire Breeders' Association, for the election of officers, members, etc., will take place at the Tremont House, Boston, Mass., on Jan. 15, 1880, at 12 M. It is expected that essays of interest to breeders and producers will be read at the meeting. . . Chicago has 21 of the largest grain elevators in the world, with a total storage capacity of 17,000,000 bushels. On Dec. 18 these elevators contained 6,549,665 bushels of wheat, 2,534,679 bushels of corn, 1,096,118 bushels of oats, 260,802 bushels of rye, and 707,897 bushels of barley, making a grand total of 11,149,161 bushels, against 10,125,252 bushels a week before, and 8,613,579 bushels at that period last year. . . Louisiana sugar-planters are trying to bring about the repeal of the reciprocity treaty with the Sandwich Islands, so as to prevent the free importation of sugar from that quarter. . . A meeting of wagon-makers from all parts of the United States was held in Chicago, lately. An advance of from $16 to $18 on farm wagons was decided upon. About $20,000,000 were represented. . . The Mobile Register thinks that $20,000,000 will be made this year by Southern planters, by the rise in crops over what they expected to get for them, and it urges that part of this be put into the establishment of manufactories in the South, especially for those spinning yarn from seed cotton. . . The Vermont State Grange is out in a vigorous protest against railroad discriminations in freight. . . The entire capacity of the Boston grain elevators is only 1,700,000 bushels; 1,081,000 bushels are now stored in them. . . The Louisiana sugar crop for 1879 is said to be worth $25,000,000. . . An elevator, with a capacity of 2,500,000 bushels, is to be constructed at Baltimore. . . Lack of corn and railroad transportation have forced the Madison (Ind.) starch factories to shut down. . . The rice crop of South Carolina is estimated at 41,000 tierces, and that of Georgia at 26,000 tierces. . . In southern Indiana and Kentucky the Hessian fly is threatening destruction to the fall-sown wheat. . . Norfolk, Va., is the first pea-nut port in the world, receiving the entire crop of Virginia, which is much larger than the growth of Tennessee and North Carolina.

NEW PUBLICATIONS.

Portrait of Dr. Holmes.—The publishers of the Atlantic Monthly have prepared for subscribers to any of their periodicals a superb life-size portrait of Oliver Wendell Holmes, uniform in size and style with the portraits of Longfellow, Bryant, Whittier, and Lowell, heretofore published.

This excellent portrait, or any one of the others above named, is furnished to subscribers, for one dollar, by the publishers, Houghton, Osgood & Co., Boston, Mass.

PERSONAL ITEMS.

Ismail Pasha, ex-Khedive of Egypt, is somewhat seriously ill.

The young wife of Minister Christianey doesn't like Peru and is coming home.

The Rothschilds have lately paid in England $195,000 probate, and $120,000 legacy duty.

Mrs. A. T. Stewart pays a tax on only $500,000 of personal property. W. H. Vanderbilt pays none.

Colonel McDaniel, the veteran turf man, is lying very ill at his residence, at Princeton, with pneumonia.

Mrs. Emily Hayne, mother of Paul H. Hayne, the Southern poet, recently died in Richmond county, Ga., 74 years old.

According to Victor Hugo forty-five is the half-way house between youth and old age. A woman never reaches the half-way house. Does she?

The English Government has granted pensions of £500 annually to the widow and £100 to the mother of the late Major Cavagnari, who was murdered at Cabool.

The granddaughter of Eugene Sue, who was the original of one of the characters in the "Wandering Jew," was a petitioner in one of the New York courts last week.

"Grant and Mahone' would carry Virginia," is a proposition laid down at Washington. The new Senator from Virginia is ambitious and very likely suggested the ticket himself.

King Kalakaua, like Dennis Kearney, dislikes the Chinese, and fears they will obtain possession of his kingdom. Therefore he asks Portugese to make their home in the Sandwich Islands.

Nine of the United states Senators have given sons or sons-in-law small jobs about the Capitol. The young men generally serve as clerks for the committees and draw $6 a day, Sunday or Monday, rain or shine

In his message to the South Carolina Legislature, Gov Simpson recommends that the convict labor be employed and utilized outside the penitentiary walls in the development of the resources of the State.

Olive Logan says the new Queen of Spain is a real bread-and-butter miss, as depicted by Byron, but her mother, the Empress of Austria, is a woman of great beauty. But, then, Olive is getting rather notorious as a sensational gossip.

Walt Whitman is ill at St. Louis—too ill to travel. When he is well enough to leave the house, he either goes down to the river to "loaf and invite his soul," or visits a neighboring kindergarten, where the children gather merrily about him to beg for stories.

The bones of John Randolph of Roanoke have been removed from their burial place at Roanoke, Va., and deposited in Richmond's Hollywood Cemetery. Judge Hunter Marshall, one of the pall-bearers at the late burial, was present at the first interment of the great Virginian in 1833.

The attorney general having granted a flat for a writ of error to the Tichborne claimant in England, an association to help to set the claimant free, and restore to him the properties and possessions of the Tichborne baronetcy has been formed. There is little danger, however, that the rotund fraud will derive any benefit from these efforts.

Mrs. Jane Grey Swisshelm petitions Congress to give to "Susan," the wife of the Ute Chief Johnson, a section of wild land, "the same to be inalienable in her and her heirs until the Fourth of July, 1979, in acknowledgment of her heroism and humanity in defending the white captives lately taken by her tribe." This is very generous of Mrs. Swisshelm, especially as General Adams alleges that Susan's blood-curdling story that she rushed into the Indian council and made a thrilling speech demanding that the captives be freed, has not a word of truth in it, and that, in fact, Susan was not there at all.

When "Thad" Stevens was a young lawyer in the Pennsylvania courts, he once lost his case by what he considered a wrong ruling of the Judge. Disgusted, he banged his law books on the table, picked up his hat and started for the door, with some vigorous words in his mouth. The Judge, feeling that his dignity was assailed, rose impressively and said: "Mr. Stevens!" Mr. Stevens stopped, turned and bowed deferentially. "Mr. Stevens," said the Judge, "do you intend by such conduct to express your contempt for this Court?" And Stevens, with mock seriousness, answered: "Express my contempt for this Court! No, sir! I was trying to conceal it, your Honor!"

No sense of having sickness in the family if you will use Hop Bitters in time. Ask those who know.

PRODUCE EXPORTS TO ENGLAND.—Lowest rates of freight and insurance on all kinds of produce, such as GRAIN, MEATS and FRUITS. Responsible Agents in England for sale of Consignments. Bankers, The Bank of New York. Cash advances made. F. H. RELPH, Freight Broker and Shipping Agent, 29 Broadway, N Y.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

Implements and Machinery.

THE NEW AND IMPROVED DEMAS

I offer to the public in this machine that which has never before been accomplished; a Turning Lathe and Bracket Saw combined—practical in every sense of the word, and so low in price as to come within the reach of all. The Saw Attachment is a fac-simile of the "Holly," except that it is more powerful and will do heavier work with great dispatch. The manner of attaching the Saw to the Lathe is a *marvel of simplicity*. It can be thrown in or out of position in five seconds *without removing any part of either machine*. Both can be run at the same time if desired. The Lathe bed is 2 feet long, 3½ inches wide and 2½ deep, built exactly the same as a machinist's iron Lathe, and has V-shaped ways for the head and tail blocks to slide upon. No other Lathe at this price has this feature. It will turn a block 5 inches in diameter and 15 inches in length, which is very large for an amateur Lathe to turn. It is built entirely of iron and steel, and stands 3 feet 5 inches in height. Spindle of steel, nicely fitted; has collars, spur centre, screw for putting chucks on; is furnished with rosette and ball chucks. No other Lathe has these valuable attachments. Cone pulley with two lifts, for heavy and light work; **has solid emery wheel**—a new feature in Turning Lathes—which makes it the best in the market for heavy and light work; tail-screw is steel; has a ball-balanced handle, and a knurled set-screw for fastening it; has two rests, one 4-inch and the other 12-inch; balance-wheel is very large and heavy; has two grooves; in fact, this is the most complete, largest, most powerful, and steadiest while operating of any Lathe and Saw in the market. The ease of operating, combined with quality, amount, and variety of work executed, places this machine so far in advance of all others that it has not a rival that will bear comparison.

No. 1 has 25 New Process Designs in sawing and turning, 3 Drill Points, 6 Saw Blades, 5 Turning Tools, Screw-Driver, and Wrench. $8.00
No. 2 (same as No. 1, except has 87 Patterns in book)..... 8.50
No. 3 (same as No. 2, with 15 feet of assorted Woods)..... 9.00

With each machine I give a Manual of Turning and Fret-Sawing (illustrated). No. 3 Demas is without doubt the most perfect and complete outfit ever yet offered the young amateur. Either above machines sent freight prepaid for **$1.00** extra.

Respectfully,
A. H. SHIPMAN, Rochester, N. Y.

Implements and Machinery.

HAY & STRAW PRESSES.

DEDERICK'S HAY AND STRAW PRESSES are guaranteed cheaper at price than any others as a gift or no sale. If inexperienced purchasers are confused by manufacturers of inferior machines who claim their presses are best, then order a press of each on condition that you keep the best, and advise all that DEDERICK'S PRESS will be there. The absence of all others will be convince you that DEDERICK'S PRESSES are beyond competition. Grand Centennial and Paris World's Fair Prizes, and all the United States Fair Premiums for years past for DEDERICK'S PRESSES. Beware of presses infringing Dederick's Pat. Press and Bale. Address, for catalogue,

N. B.—The attention of the public is respectfully invited to other advertisements of Hay Presses which have appeared in these columns, all of which make Dederick's patent sectional quadrilateral bale bound lengthways, and by Dederick's patent process and machinery, and some even have the cheek to use Dederick's Continuous Hay Press patent, without which the operation must stop to tie and remove the bale. Dederick has suits pending to enforce these patents, and will in due time prosecute every purchaser for $10,000 damages. Meantime he earnestly remonstrates against this high handed piracy of his property, and warns the public against being swindled into partnership in a steal with unscrupulous characters. Why join a steal for the benefit of thieves and receive an inferior machine, when the same price will purchase a good one of the owner. While Dederick bore the immense expense of introducing these improvements that are such a benefit to the hay interests of the country, these communists opposed him, and now propose to steal not only Dederick's patents, but the capital represented by its introduction into use. Send for free copies of patents in proof of this.

Wit and Humor.

MRS. PARTINGTON says Ike has bought a horse so spirituous that it always goes off on a decanter.

"THAT'S what beats me," as the boy said when he saw his father take the skate strap down from its accustomed nail.

MAMMA—"Why, Poppett, all these apples are bitten. Have you touched them?" Poppet—"No, ma. But it froze last night, and p'r'aps—p'r'aps they're frost-bitten!"

JANE (under nine) to her governess: "Miss Blunt, when ma asks you to have some more wine to-day at dinner, do, please, say yes." Governess: "Why? What do wish me to take more wine for?" Jane: "Oh, I only want to see ma's face."

LITTLE Master Roddy has been in the habit of putting his pennies into the box at Sunday-school till last Sunday, when he came ruuuing into the house in a breathless hurry and shouted: "Mamma, I shan't save up my pennies any more. The money don't go up to God! I saw Mr. Kelly take it and put it in his pocket!"

"Oh, yes, wait till Christmas," snarled the youthful scion, "that's always the way. If I want a new sled, wait till Christmas; a pair of skates, wait till Christmas. I waited last year, and I didn't get sled or skates either. Nothing but a book with a red cover and a little baby card with verses onto it. Christmas is a fraud. Boys never get nothing they want."

A YOUNG man, dressed in the hight of fashion, and with a poetic turn of mind, was driving along a country road, and, upon gazing at the pond which skirted the highway, said: "Oh, how I would like to lave my heated head in those cooling waters!" An Irishman, overhearing the exclamation, immediately replied: "Bedad, you might lave it there and it would not sink."

A READY ANSWER.—"Mr. Brown, couldn't you give me a position of some kind with you?"

"Very sorry—don't think there is any vacancy in my establishment."

"If you have nothing else employ me as your adviser."

"Very well; you may commence by advising me how I can best get rid of you."

YES, FUN, LOTS OF IT.—"Do animals have fun?" asked some unobserving individual. Of course they do. When a cow switches her tail across the face of the man who is milking her, steps along just two yards, and turns to see him pick up his stool and follow, she has the most amused expression on her face possible, and if she can kick over the milk-pail she grows positively hilarious.

THE inhabitants of the Bordelais country are prone to exaggeration, but one of them recently met his match. He was dining with a Japanese friend on the Boulevard, and mushrooms came under discussion, "In my country," said the Bordelais, "the mushrooms under the trees are larger than these plates." "What of that?" exclaimed the Jap." "In my country it is the trees that grow under the mushrooms."

A certain old gentleman, very rich and still more stingy, is in the habit of wearing his clothes to the last thread. One of his friends, meeting him, exclaimed: "They told me that you had a new hat, and I'll be hanged if you haven't!" "Oh, yes," said the miser, looking as if he were a trifle ashamed of himself, "you see, my wife kept telling me that the old one was a good deal worn out. Well, yesterday was my wife's birthday, and I got myself a new hat for her birthday present."

THE FEBRUARY ATLANTIC

WILL contain, in addition to its full quota of reading, (144 pages, including an installment of Mr. HOWELL'S New Serial Story, which has already attracted great attention,) a Supplement giving a full and authentic report of

THE HOLMES' BREAKFAST,

including all the Speeches and Poems, with such description as is necessary to give an adequate idea of this memorable occasion.

THE ATLANTIC FOR 1880

Is enlarged to contain 144 pages in each number, is printed in beautiful large type, and will embrace a great variety of the best *Serial* and *Short Stories, Travel Sketches, Essays, Poems,* and *Papers on Living and Practical Topics,* by the first American writers.

TERMS:—$4.00 a year, in advance, *postage free;* with superb life-size portrait of HOLMES, LOWELL, WHITTIER, BRYANT, or LONGFELLOW, $5.00; with two portraits, $6.00; three portraits, $7.00; four portraits, $8.00; with all five portraits, $9.00.

Remittances should be made by money-order, draft, or registered letter, to

Biographical.

OUR PORTRAIT GALLERY.

ROBERT W. FURNAS.

Robert Wilkinson Furnas was born in Miami County, Ohio, on May 5, 1824, and was married in Cincinnati, Ohio, in November, 1845. His father was a farmer, and both his parents were "Friends" or "Quakers," and were born in South Carolina, his grand-parents having immigrated to that State from England. He remained on the farm until 17 years old, when he went to Cincinnati where he served a regular apprenticeship of three years to the printing trade. His educational advantages during boyhood were exceedingly limited; but none of the many opportunities of picking up information afforded in a printing office were neglected, and the greater part of his present attainments was acquired over the mid-night lamp in that school, principally after the age of maturity. When 22 years old he returned to his native county, Miami, and purchased, published, and edited the "Times," at Troy. Afterwards he engaged in the book trade in the same town, and subsequently became a railroad agent and conductor. In 1856 he emigrated to Brownsville, Nebraska, where he established a newspaper, the Nebraska Advertiser, still published, being the oldest paper in the State.

In his adopted State his career has been distinguished, and the list of public offices he has efficiently filled marks an active and honorable life. For one year he was chief clerk of the Senate branch of the Nebraska Legislature, and for four years a member of that body. In the early part of the late war he was commissioned by President Lincoln as colonel in the regular army, and organized and commanded a brigade of Union Indian soldiers in Kansas, Missouri, Arkansas, and the Indian Territory. At the solicitation of the Governor of Nebraska he resigned his Indian command, came home and organized the Second Nebraska Cavalry, of which he was appointed colonel. In this capacity he served under Gen. Sully in the Indian war on the extreme northern border of the United States.

His military career ended, he became agent for the Omaha and Winnebago tribes of Indians. He was regent of the Nebraska University for six years, during two of which he was president of the Board. He is an ex-president of the St. Louis and Nebraska Trunk Railroad Co. For eight years he was president of the Nebraska State Board of Agriculture. He has been Governor of his State for one term—that of 1873-4. At present he is president of the Nebraska State Horticultural Society; president of the Nebraska State Historical Society; ex-president of the Nebraska State Soldier's Union; Past Grandmaster I. O. O. F.; Past Grandmaster, Past ex-High Priest, Past Grand Commander, Past Grand Patron of all Grand Masonic bodies of the State, and a vice-president of the American Society.

While a member of the Legislature he drafted and secured the passage of the first Common School Law; also an act creating the State Board of Agriculture, and was always alive to all questions that tended to promote educational and agricultural advancement.

In politics Gov. Furnas is a Republican; in religious matters he is affiliated with the Presbyterian Church, and for 30 years he has been active in temperance organizations. He has always enjoyed good health, and he carries his years so well that those who do not know the date of his birth, might readily take him to be not more than from 35 to 40 years old. During life his motto has been: "Leave the world something the better for having lived in it." He has "gone up to the head" in all things he has undertaken, firm in the belief that "*patientia omnia vincit.*"

His life has been so busy a one that he has not had time to get rich. True, he made and owned one of the best farms in the West—especially as regards fruit—but grasshoppers and Shylocks wrested it from him. He has always been enthusiastic in his opinions as to the benefit of tree-planting on the Western prairies, and has with his own hands set out thousands of fruit and forest trees, has had many more thousands planted for him, and been instrumental in the clothing of the treeless prairies of the State with millions of forest and fruit trees. All along he has taken special pride in advancing all educational and agricultural interests in the whilom "Great American Desert", which, during his time and not a little owing to his efforts and the influence of his example, has become a teeming area of arable, meadow and rich pasture land.

At present Gov. Furnas is engaged in farming and fruit-growing, with every prospect of soon re-establishing the fortune of which insect and usurious pests some time since deprived him. The Governor is pre-eminently a self-made man, having since the age of ten "hoed his own row," both his parents having

ROBERT W. FURNAS.—Fig. 8.

died of cholera within four days of each other when he was in his ninth year. He is now the only member of his family living, a twin brother having died before his parents, and a sister shortly after their death. Among the representative men of this country—those who have made an honorable position for themselves by their talents, energy, honorable life and valuable services, Governor Furnas stands in the front rank.

With such men in the van, little wonder that the Great West has advanced rapidly over the great prairies, subdued the Great American Desert and become the hope and home of the landless, the impoverished, the enterprizing and the bold spirits not of the Eastern States alone, but of Europe and one might almost say, of the entire civilized world.

Entomological.

NOTES ON THE CABBAGE WORMS.

PROFESSOR CYRUS THOMAS.

Swapping the ten-lined potato beetle to the East for the European cabbage worm, has not been a very profitable exchange on the part of the West, at least I can say that for Illinois it has not. The butterflies of this species—Pieris rapæ—so far as I can ascertain, first made their appearance in this State, in the vicinity of Chicago, in 1875 or 1876. The first notice that I can find of injury by the worms was in 1876. In 1878 they appeared in Central Illinois in large numbers doing much injury to the cabbages; a few butterflies were observed also in the extreme southern portion. During the past season they have been very abundant, over a large part of the State, playing sad havoc with the cabbages. This as a natural consequence has caused the wide-awake horticulturists of our State to test the remedies heretofore proposed and also to try new ones when these failed; what has been the general result I will mention a little further on.

As is well known, the female of this species scatters her eggs singly over the leaves; our native Western species, Pieris protodice, appears to have the same habit. The habit which the young larva has, of devouring the egg shell immediately after it has escaped from it, appears to be common to all the species of the genus, and was long ago noticed in reference to P. brassicæ by that close observer Harold.

I had a fair opportunity the past season of testing the statement made by Dr. Fitch as to the peaceable and unaggressive disposition of the worm. Toward the close of the season a new cabbage worm made its appearance in my garden in considerable numbers. I observed the two species feeding together generally in perfect harmony: but the European species always avoided any intrusion on the rights or premises of its neighbor. This characteristic of the worm, which is very marked, is directly in contrast with the character of the perfect insect, which, as it had done in the Eastern States, has driven before it, wherever it made its appearance, our native species. I am informed by one careful observer that he has even seen it battling with our native cabbage butterfly. Be the cause what it may, as soon as it made its appearance in a locality the native species, although abundant before, immediately disappeared. The pupa state of the first or summer brood as given by Dr. Fitch, varies from seven to nineteen days; the observations made here indicate a somewhat shorter period for this latitude, varying from five to ten days. The species is generally understood to be two-brooded. The perfect insect was taken here last spring early in March, and the worms were still feeding as late as the last days of November. The butterflies were more or less numerous all summer, but they appeared to be most abundant at three periods—in March and April, July and September. Hence I feel quite certain that we have had three broods in the southern extremity of the State the past season.

It has frequently been stated that the worm has a habit of boring its way into the heads of cabbages. My observations do not confirm this statement. That it will bore part way into an incipient head, while the leaves are yet partially separated is true, but I failed to find a single instance of a worm boring into a solid head through the thickness of even three leaves; a fact which I deem of much importance, as it affords a possible remedy I shall call attention to.

Natural Agencies Which Assist in their Destruction.

Fortunately for our gardeners, the little chaleid parasite—Pteromalus puparum, Linn.—which infests the pupa, made its appearance also this year, and, from the large number of parasitized chrysalids I have observed, promises to give us efficient aid in the destruction of this pest next season. A large number of the cocoons and a few specimens of the perfect insect of a species of Microgaster (not yet determined) were observed in company with the worms. The cocoons are white, which fact alone would indicate that it is different from the species that attacks the cabbage worm in Europe.

In examining the remains of pupæ of the cabbage insect that had been infested by the Pteromalus, I noticed that in almost every instance some of the parasites had failed to make their escape. As these had passed through the pupa state, though not always with perfect wings, it is certain that they had not been attacked by a secondary parasite. Did they fail to perfect their organization and to acquire sufficient strength to cut their way out from want of sufficient food? According to Curtis as many as two or three hundred may be found in a single pupa of Pieris brassicæ—which is a larger species than P. rapæ. In the latter I find the number to vary from ten to thirty, which corresponds closely with Dr. Packard's observations.

I found no instance of the worm being attacked by a Tachina fly. A small spider, probably the Theridion brassicæ of Dr. Fitch, was quite numerous among the cabbages, but I did not observe it feeding on the young caterpillars.

Artificial Remedies.

Old Vincent Kollar, in his work on "Injurious Insects," says: "The best way to destroy them is by picking off and killing the caterpillars as well as the pupæ, as far as it is possible." Curtis in his "Farm Insects" says: "There are several methods of reducing their numbers and checking their increase; the best is to look in the winter for the chry-

salids, which are concealed under the ledges of walls, pailings, doors, window-sills, on bushes, in hedges, on the trunks of trees etc., and crush them; but on no account to destroy the dark-brown-colored ones which are full of the parasitic Pteromati. As the spring advances, ring or large bag-nets may be used to catch the butterflies; and when the caterpillars are large enough to be seen, hand picking is neither difficult nor laborious; or dusting the plants with hellebore powder, fresh and genuine, would be worth a trial, and it is very effective in some instances." Boisduval in his "Entomologie Horticole" gives but one remedy, that of catching the butterflies with insect nets. Duponchel, in his work on "Caterpillars," recommends as the most effectual remedy, employing children to catch the butterflies, and destroying the pupæ. Dr. Fitch also recommends employing children to catch the butterflies, and suggests placing pieces of boards between the rows of cabbages, elevated two or three inches above the ground, as places for the worms to pupate, where the pupæ can easily be collected and destroyed. His chief remedy appears to be killing the caterpillars by cutting them asunder with scissors. He thinks topical applications of poisonous substances, such as hellebore etc., of no particular value. Prof. Riley repeats the recommendation to capture the butterflies; also recommends trapping the pupæ by placing boards between the cabbages. He adds that the "saponaceous compounds of cresylic acid are effectual, and without objection as to poisonous qualities." In addition to these remedies the following have also been recommended:—Drenching with hot water; sprinkling with salt; drenching with brine; with weak lye, with dilute carbolic acid, with decoction of Elder; with decoction of Dog-fennel, etc; dusting with hellebore, powdered lime, ashes, pulverized black pepper, meal, saw-dust, road-dust etc.

I tried the experiment of catching the butterflies with insect nets, and am satisfied that children, from ten to fifteen years of age, can soon be taught to do this with ease and rapidity. The butterflies move heavily and rather slowly, alighting especially on cruciferous flowers; a small bed of early radishes here and there, allowed to run to seed, will attract them, and they may then be caught without running among the cabbages, which is one objection to this method of relief. But the efficacy of this method depends very largely on cooperation; for it is rather irritating to toil two or three days in the hot sun-shine—for it is then they are most numerous—and as you think the enemy is about conquered, to see a fresh army pouring over the fence from your neighbor's garden which is left to shift for itself. If a proper combined effort is made to capture the butterflies when they appear in the spring in a neighborhood, and are few in number compared with what the summer brood usually is, they may be so generally destroyed that with a little additional labor in destroying what worms appear, cabbages may be saved from injury.

I tested by experiment most of the topical applications I have named, and found none of them to be effectual. The pests will eat with apparent unconcern when covered over with a thick coating of lime, ashes or salt, and according to Dr. Fitch, of hellebore. Of the liquid applications tried the most effectual was a lye made by mixing strong ashes in water, warm at the time used, and applying it in as large quantities as the cabbages would bear. Unless used somewhat carefully, it will discolor the outer leaves of heads. Lime and brine were of no value whatever; elder decoction killed a few; other applications gave similar results. Adding my experience to that of numerous other persons throughout the State, who were experimenting, I am satisfied that no application yet suggested will prove of any real value as a remedy for this cabbage worm, which, though apparently so tender and delicate, is, in fact, exceedingly hardy and tenaceous of life, much more so than most leaf-eating caterpillars.

Although the list of materials tried is a rather long one, yet I am not prepared to say there is no topical application that will destroy the worm without materially injuring the cabbage. The fact that the species and its congeners have long been injurious in Europe without such a remedy having been discovered, renders the likelihood of such discovery doubtful, but not conclusive. If some method of applying kerosene can be devised that will not injure the cabbage, it may be effectual. Dry, pulverized cayenne pepper, if not too costly, might be beneficial. There are also numerous other substances which might be suggested which I had no opportunity of testing, which it would be well to try. Placing a leaf of the cabbage on the top of it at night, as a means of drawing them together, has been recommended, but the indisposition of the worms to leave the leaf they are on, prevents this from proving as beneficial as it appears theoretically to be. One serious drawback to any such remedy, could one be found, is that although one brood of worms be destroyed, unless there is combined action on the part of our neighbors, we will be overwhelmed by a second swarm from the surrounding gardens, and by the time these are destroyed, our cabbages will be comparatively worthless.

It behooves the gardeners, therefore, to ascertain if there is any mode of cultivation by which the cabbages themselves may be enabled to resist these attacks. Notwithstanding the general destruction where the insect was abundant, a few persons succeeded in raising a full crop of fine, large heads. Upon inquiry I found that in these cases it was owing almost entirely to two facts:—First, the ground was made as rich as possible. Second, the plants were brought forward a little earlier than usual—some two or three weeks in advance of the usual time—and were pushed to heading by extra culture. As heretofore stated, if firm heads are formed the worms will do them, in this section, at least, but little injury. Our early varieties suffered no injury from the worms. How far this is true in reference to northern latitudes I am unable to say. Certain varieties of cabbage, I noticed, suffered less than others, chiefly, as appeared to me, on account of their firm heads, and heading at a rather early stage of their growth.

In concluding my notes on this species, I would urge further experiments with topical applications, but would recommend to gardeners to rely chiefly on the following means:—Capturing the butterflies, especially the spring brood; killing the worms, using scissors for this purpose; earlier planting; selecting the firmest-headed varieties; and giving the plants as vigorous growth as possible, by enriching the soil and thorough cultivation.

The chief objection to the earlier planting is the difficulty of preserving the crop for winter use when the fall is warm, as it was last winter. How far this can be accomplished the gardeners must decide.

Farm Topics.

WINTER WORK FOR FARMERS.

As long as the ground remains unfrozen there is little excuse for idleness upon the farm, but when the earth becomes snow-bound and the soil frozen so as to be impenetrable by farm implements, we naturally seek the comforts of the fireside, leaving it only when occasion requires. The farmer who has been diligent and persevering during the seasons of seedtime and harvest, is certainly deserving of all the repose he needs in winter, but there is danger of excess in that direction, which is detrimental both to health and successful farming. If we will use a little thought we will find means of employing our winter leisure, which will prove pleasant and profitable.

Pruning Fruit Trees.—The orchard is a department of the farm that too often suffers from neglect. The best time to prune fruit trees is a subject upon which farmers disagree; but, all things considered, there is probably no better time than February or March. At that period farmers usually have little else to do, and the work will be more thoroughly done than it would be if postponed to a more busy season. The warm days of February furnish an excellent time for tree pruning. With a short ladder, a strong pruning knife and a fine-toothed saw, the farmer should go over his orchard every year. When two branches are rubbed together by the wind so that the bark is marred, one of them should be removed. Dead and broken limbs and sprouts should be cut off and wherever the shoots have grown so thick as to interfere with each other, they should be thinned out. Whenever it is found necessary to cut off a large branch, the wound should be sealed as soon as the surface becomes dry, with a coating of white lead or common paint. This prevents a waste of sap and preserves the wood from decay.

The Farmer's Shop.—A good workshop containing such tools as can be used to advantage by the farmers, should be found on every farm. A room with a stove in it and large enough to permit of the construction of a hay rigging, a gate or portable fence, will furnish a place where many hours may be healthfully and profitably spent in the most inclement weather of winter. Here a great deal of repairing may be done that would otherwise find its way to the professional mechanic. New tools may be built, that will be needed on the farm, or harnesses may be oiled and repaired and a great many things that will suggest themselves may be done. In mild weather the thoughtful can find profitable out-door work, such as repairing outbuildings and cutting up fallen branches from trees.

I do not mean to be understood that every hour in winter should be spent in labor. Every farmer should spend a portion of his winter leisure in reading good books and papers, and in conversation. Winter is the only opportunity that farmers have to improve their minds, and a few hours each day should be spent in intellectual culture; but when the head begins to ache from long-continued reading by the fireside, it is a hint that out-door exercise is needed. Whenever I see an orchard with the trunks and branches disfigured by lusty sprouts and black, dead branches, or a pair of bars where there should be a gate, or farm implements out of repair at the beginning of the busy season, I am led to believe that the owner has not made good use of his winter leisure.

Chemung, Co., N. Y. G. A. Goff, Jr.

STONE FENCES.

W. J. FOWLER.

One of the oldest kinds of fence is the stone wall, and, despite some objections, it is likely to retain its popularity for localities where huge bowlders cover the ground. The special advantage of the stone fence is its permanence, and to secure this to its fullest extent the wall must be well laid and have adequate drainage. It is a common mistake to suppose that piling very heavy stones upon each other is a protection against frost. The expansion of water by freezing will rend asunder the strongest vessel, provided no other way of escape for the imprisoned water is provided. Huge bowlders will be tipped over and thrown down as easily as if they were smaller and the more of them there are on the wall, the heavier becomes the work of rebuilding when time and frost have done their work. But on land that is naturally or artificially drained, a full stone fence without rails or posts is most reliable and permanent. The stones need not be large, but they should be well laid and not less than three and a half feet above ground, including the bank. It is better to lay the foundation one foot below the surface to protect from frost. The bank also serves the same purpose. It requires a great many stones to make a wall of this discription, two feet wide at base and, including foundation, four and one half or five feet high. To the beginner the temptation will be strong to build a half wall and top off with stakes and rails. But if a permanent fence is desired, the temptation should not be yielded to, and if the place does not need a permanent fence, stone should not be used. Removing an old wall, even if there are not half as many stones as there should be, costs about as much as the land it occupies is worth. Very many farmers have torn up such walls within the last twenty years, as reaping and mowing machines have made small fields inconvenient to be profitably worked. Thousands more regard the old division fences as nuisances, and are only kept from removing them by the labor and expense and the added fact that if the stones were out of the wall, they would on many farms be as much in the way somewhere else. So difficult is it to decide where permanent fences are needed that it may be almost made a rule not to lay any wall except for outside fences. Stones not needed for these or for building, had better be buried out of the way where they lie rather than be dug up and drawn away to be perhaps equally a nuisance after a few years in some other place. It is better economy generally to have such inside fences as are needed of such material that they can be easily changed or removed when occasion requires. When a farmer gets his rotation of crops exactly to suit him and adopts his fences to it, the chances are that after a few years he or his successors will be compelled to change the rotation, so that the fences will not be adapted to the changed necessities of his management.

Arboricultural.

OTHER MAPLES.

SAMUEL PARSONS, JR.

Every lawn almost has Sugar Maples, Norway Maples, Silver Maples as well as Scarlet and Sycamore Maples. Possibly after the Elm we find no deciduous tree more commonly employed than these Maples. I have endeavored to speak with all due respect and admiration for such trees since their importance to the lawn planter is evident and great. The Japan Maple Polymorphum also has been and is receiving much well deserved attention. But it has occurred to me to ask how about the *other* Maples not commonly spoken of in connection with lawn planting. There are *others* we know. We believe, and perhaps know them to be, in many ways, excellent ornamental trees. Yet we do not use them, if we know them, and if we do not know them, then are we sadly deficient in lawn planting knowledge and should be enlightened. Let us look at a few of the most striking. There are half a dozen at least, and I do not include among them several Japanese species that are as yet mere curiosities of the botanist.

Unquestionably the most familiar is Acer campestre, the English Field Maple, common in Great Britain along road-sides and hedges, yet little used in America. Its neglect must arise from mere carelessness; for it is a picturesque little Maple, having neat, compact foliage and otherwise special fitness for the office of either shrub or tree. Very hardy, easily managed and cheap, it is perhaps better fitted for certain positions than any other Maple originated out of Japan. It may not be very choice, but it and its varieties are certainly valuable in lawn planting. I wish it could enjoy higher consideration and more general employment.

The striped Maple (Acer striatum or Pennsylvanicum), the Snake Maple, or striped Dogwood is also one of the *other* Maples that though commonly known, especially in America, continue to be slighted in our lawn planting operations. It is a neat, compact, elegant tree remarkable for a striped, light-colored bark—whence the name. An Eastern American Maple, it deserves, on that account, even more attention, because we are thus assured of its entire hardiness and fitness for our climate. The leaves are of good size and of a bright and cheerful green; round-headed, rather than pyramidal in contour, the general effect is that of a low tree, only somewhat larger than the English field Maple, (Acer campestre). As we shall see again, Acer striatum forms one of the most noteworthy types that may be recognized as possessing their analogues in Japan or along the Amoor river. The flowers are greenish-white.

There are three other American Maples quite noteworthy, Acer spicatum, circinatum and macrophyllum, all natives of America. The last is found in Oregon, has a large leaf six to twelve inches long, and a fine ornamental appearance. It is, unfortunately, not entirely hardy in Eastern America, a peculiarity California and even Oregon plants are apt to evince. The flowers, in this case, are yellowish.

Acer circinatum, the Vine Maple, is also from the Pacific Coast, a round headed, low tree, or "spreading bush with thin, moderately seven to nine-lobed leaves," and small corymbs of purplish-red flowers. The leaves, in fact, are roundish or heart-shaped, and the contour of the entire foliage likewise more or less round, forming a feature on the lawn, always pleasing and effective. Acer circinatum is a tree little known, but deserving of very general employment. Unlike Acer macrophyllum, it proves perfectly hardy in spite of its origin. The other Maple is Acer spicatum, the Mountain Maple, a tall shrub or low tree common in the Northern States of America. The leaves are not specially striking, but the flowers bloom latest of all the species. I have sought attention for this Maple, not because of its superior excellence, although it is attractive enough in its way, but on account of its curious resemblance to a Maple of the Amoor River, also termed A. spicatum. In Japan, if not in the same region, we have repeated almost identically the form of A. Pennsylvanicum as A. tegmentosum. A. Pennsylvanicum, again, suggests somewhat the appearance of A. Colchicum rubrum (or mono. or lætum), another species belonging to the same region as the last. It is very curious to thus notice different forms of Maples almost repeating themselves under like conditions on opposite sides of the globe. Japan is full of these resemblances, analogues of kindred forms in America.

Acer Tartaricum Gennali is yet another interesting Asiatic Maple. The leaves are small, heart-shaped, light-colored, and a curious drab-green, and the general contour is that of a large spreading bush. It is not a new species or variety, yet it is decidedly choice and uncommon.

Passing from Maples of Europe and America we come to the *other* Maples of Asia, to one or two of which I have just alluded. Indeed, species and varieties of Maples abound in both the Amoor region and Japan.

First and perhaps foremost of the *other* Maples of Asia, of which I desire to speak, is A. Colchicum rubrum, an old but choice Maple, somewhat hard to propagate, but always valued by those who know its excellent ornamental qualities. Bright-red leaf-stems and leaves, the latter with triangular lobes, distinguish the young growth of this Maple, and render its appearance charming both in spring and fall. It has a smooth, light-colored bark and fresh, green, mature foliage. Strange to say, this Maple, commonly called Colchicum, which makes it a native of the region of the Caucasus is distinctly declared by all good authorities a Japanese species, lætum, mono, and perhaps trimcatum. This will readily account for the fact that it does not graft readily on American or European Maples. A. Colchicum (mono or lætum) is one of the most valuable of the *other* Maples, perhaps as valuable, ornamentally, as any member of the genus.

In Japan we have, besides the numerous polymorphum or palmatum varieties, Japonicum, Sieboldianum, diabolicum, rufinervum crataegifolium and the curious Acer carpinifolium, a

plant that few on first acquaintance would class with Maples. These kinds, however, have been either spoken of before or possess little value for the lawn planter if, indeed, they are practically attainable; certainly in several cases they are not. I should perhaps say that all Maples here spoken of as among the *other* Maples are worthy of distinguished single positions. Since they are chiefly small trees, they may be also placed on the outskirts or in the middle of shrub groups.

Thus you perceive that the *other* species and varieties of the genus Acer (may I not say of all genera?) have, in very many cases, an ornamental value not to be neglected, or even, perhaps, set below that of our best known trees.

Pomological.

THE DAVENPORT APPLE.

Among the new and excellent apples, which deserve the attention of the public, is the Davenport here illustrated. In the latter part of November we received two specimens of this apple from the veteran pomologist, Mr. Charles Downing, who pronounces it "very fine as an eating apple and valuable for family use." Mr. Downing's attention was first called to this new apple by Joseph Davenport, of West Hartford, Conn., who informed him that it originated on the farm of Rev. Edward Davenport, of Colerain, Franklin Co., Massachusetts. The tree, he said, is a moderate grower, forming a round, spreading head, and bearing very abundant crops in alternate years. The apple is a russet, and, as will be seen in the engraving, it is somewhat below medium in size. Flesh delicious, tender, juicy, subacid; season, October December. Its russet color and small size will likely prevent it from ever attaining popularity as a market apple; but for home use it deserves to be appreciated by all lovers of good fruit.

INDIANA HORTICULTURAL SOCIETY.

The Nineteenth Annual Session of the Indiana Horticultural Society was held at Dublin, December 16, 17, and 18. The meetings were well attended and the proceedings the most interesting the Society ever had. The first meeting, as is usual, was occupied by an address of welcome with a response by the president, reports of the officers, and appointments of special committees.

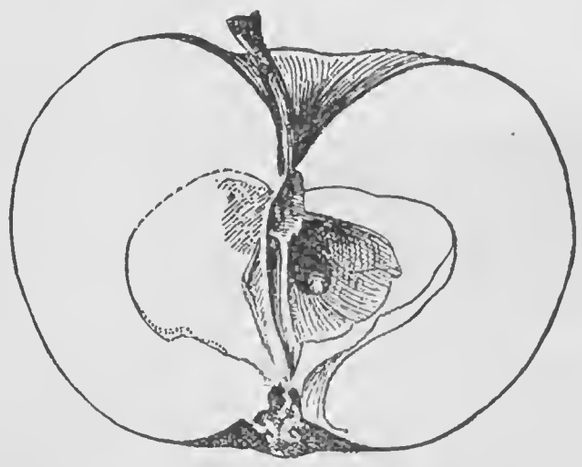
The evening session was opened by an address on the care of orchards and profit of fruit-growing by Dr. A. Furnas. He preferred a western slope on soil that will produce an average crop of corn or potatoes. He prepares the ground as if for corn, digs holes large enough to take in the roots without crowding, and prefers a two-year old tree. He is not so particular about the top, but wants plenty of roots. He plants most varieties two rods apart; but some varieties, such as the Wagener, Jersey Black and some others, it would do to plant much closer. For the first five or six years he cultivates in corn or potatoes; then sows in grass and turns on hogs. He thinks a crop of oats injurious. He prunes in sugar-making time for wood and in August for fruit and recommends the root-pruning of unproductive trees. He says, do not plant too many varieties; the present market demands a large red apple; plant regular bearers and trees that bear early. He knew an orchard of Ben Davis of which the fruit the eighth year after planting, sold for $2.40 per tree. He spoke favorably of Rome Beauty, Smith's Cider, Indiana Favorite, and Maiden's Blush.

The address was followed by a very interesting discussion participated in by N. Ohmer, of Ohio; C. R. Coryell, of Michigan, and others on the effects of the warm temperature during the fall months on the keeping of fruit. Some saved their apples by picking them early and covering them with straw or corn-stalks; some who in former years succeeded by picking and putting them in barrels and leaving them lying under the trees, lost most of their fruit by so doing this year.

The meetings of the second day were mostly occupied by reports of which the president, Sylvester Johnson, made a very interesting one of the late meeting of the American Pomological Society. J. C. Ratliff, delegate from this society to the late meeting of the Michigan Pomological Society, gave a very interesting account of the proceedings of that body. Reports of Hon. J. D. G. Nelson, Wallace Ragan, Dr. S. S. Boyd, and D. E. Hoffman, members of the State Fruit Committee, showed that the last season on the whole was a favorable one—as there was a large crop of small fruits and grapes and an average crop of pears and apples; the latter however did not keep very well.

The meeting in the evening of the second day was opened by an address on Ornithology by Prof. A. W. Brayton, who had a very large and interesting collection of specimens for the inspection of the members. He commenced by stating that we had during the year about 280 species of birds in the State, of which about 150 made it their breeding grounds. Some 25 or 30 remained during the year and the rest simply went across the State in their annual migrations.

Dr. John A. Warder, of Ohio, delivered a very interesting lecture on Entomology—he closed his address by referring to a favorite topic of his—the Catalpa as a timber tree, and showed some of the wood which had been exposed to the weather during 67 years and still remained sound.



DAVENPORT APPLE—DRAWN FROM LIFE—FIG. 9.

There was a large number of very interesting papers read. One by Mrs. E. Boyd deserved notice; but want of space forbids it, and I will close by referring to the fruit on exhibition, which consisted of 546 plates of apples, two of grapes, and six of pears. There was also a fine lot of potatoes, corn, dried and canned fruits, and a very well executed bust made out of gilt-edge butter.

D. E. H.

For other reports of Industrial Societies, see page 29.

IRON FOR PEAR BLIGHT.—Noticing lately several recommendations of "iron as a fertilizer" and "salt for pear blight," calls to my mind the following:—Some eight or ten years since I found the blight had attacked a few dwarf pear trees on my ground. This was the kind of blight in which the young wood suddenly turns black. I applied to the surface of the ground, under the trees, a strong solution of sulphate of iron (copperas) several times till the soil was of a yellow color, pruned severely all the affected wood, and have never seen any blight there since. I would not state that iron will cure pear blight in all or any cases, or even that it did so in this case, but I should most certainly apply the same remedy, should blight occur again on my premises.

Muskegon Co., Mich. S. B. P.

Horticultural.

COVERING TENDER SHRUBS, HYBRID PERPETUAL ROSES, ETC.

If we could depend upon snow lying through all the freezing weather of our bitter winters, we should need no other covering for plants, for there is no better shelter than the snow, at least as long as it has some two or three inches of depth over the plants to be guarded, and as long as it remains open and cellular. Then it prevents the soil warmth radiating off into space, just as dry ashes, or dry sawdust, or tan, or chaff, or wool, or the like open and cellular matter, will prevent radiation back into a heap of stored ice.

But some very charming and desirable beauties of our yards cannot be bent down like a vine so as to lie under the snow, and a common recourse is to wrap them with straw. This makes a lawn look ghostly through the long winter, adding to the universal whiteness, when the snow sheet everywhere before us makes one long for some soft color, some bit of green or neutral color to rest the dazzled eye. Where they can be had, branches of Hemlock Spruce or other evergreen, answer well and look well; the leaves will not drop until the hot sunshine of April burns them off. Generally a mere screen against the direct blast of the wind and impact of the March sun upon frosted leaves or shoots is sufficient. Plants easily broken should have a few stakes set in round them before the ground freezes, to be tied together in a point above the summit of the closed-in shrub. Evergreens, such as the Japan Euonymus, etc., should not be quite deprived of light or air; their thickest shielding should be on the south and west sides. An empty flour sack of tough buff paper makes a ready and perfect covering for deciduous H. P. Roses, etc. If there is danger of the snow being whirled away from over the roots, a little litter should cover them to retain snow and aid its useful service.

For protecting a low, tender tree, such as a Fig, or an Orange, or a Tea-rose, from the first autumn frosts, in order that it may retain its leaves longer and ripen its wood and bark better before being covered or transferred to the cellar, a large store box, open at the bottom and cut in two horizontally, makes a very convenient covering. The lower part remains in place round the tree, and the upper is lifted to expose the leaves to the sunlight in mild weather, and shut down on threatening evenings as easily as the lid of a trunk. Two superimposed boxes can be used for a taller plant.

The Worden and Champion (Talman) Grapes.

In order to compare the merits of these two varieties with others better known, I have made tests from grapes grown in the same vineyard, with the following results:

	Per ct. Sugar.	Per ct. Acid.
Delaware	21.0	1.2
Isabella	16.0	1.7
Concord	16.0	1.5
Worden	17.0	1.0
Champion	10.0	0.9

All were picked in good order, well ripened, except the Champion which were over-ripe and considerably shriveled. My samples of these were picked Oct. 9th, long after the time when they should have been marketed. This would deduct from the acid, and add to the sugar, but with this advantage they fall a little over one-third below the Concord in quality, and stand below good apples in the amount of sugar they contain. The Worden has one per cent. more sugar than the Concord, and has one-half per cent. less acid, consequently they will *taste* better to the average eater. NELSON RITTER.

Field Crops.

TEOSINTE.—A CAUTION.

Nov. 2d, 1878, we reported our trial of this plant. Since that time it has been talked about first by one journal, then by another all over the country—all, for the most part, based upon what it had done in warm climates. We hope there is no danger of another "Pearl Millet" excitement over Teosinte for this or a more northerly latitude, since we think we can assure our readers that our season is entirely too short for it and that it can never prove as valuable for green fodder as corn. To help nip any such danger in the bud, however, we reprint what was stated in the article above referred to:

"Among novelties sent out by Vilmorin & Co., of Paris, France, last year was Teosinte (Reana or Euchlæana luxurians), a fodder plant resembling corn in its stalk and leaf. Our seed was sown May 15. It was, like the Pearl Millet, slow to germinate and slow to grow until late in the summer when the rate of growth was very like that of corn. Oct. 12, when the leaves had been somewhat withered by frost, one of the largest plants was cut and found to weigh ten pounds. It measured five feet in hight and consisted of seventeen stalks. These stalks were thicker, softer, the juice sweeter than those of corn. There were more leaves also and they were broader and more tender. It is a perennial plant in its native home, Central America, where its stalks are cut off and fed to cattle, new shoots again growing from the roots. Those plants which we cut back, made very little growth afterwards. The very large tender leaves, the heavy succulent stalks and their sweet juice, and the luxuriant growth of the plant during hot weather, might warrant a trial of Teosinte in our more Southern States."

In the same number we gave a very good illustration of the plant, also taken, as we remember, from a cut which was sent to Mr. W. H. Carson by Vilmorin & Co., or redrawn from the latter's catalogue, we are uncertain which.

Cow Peas.

Messrs. J. M. Thorburn & Co., say they have received the following information on this subject:—

The Speckled and Whip-Poor-Will are the favorite varieties in general use, being the earliest and most prolific. The crop is easily gathered as it is not inclined to climb or trail, the growth being like that of snap or bush beans. The pods when green and tender can be used, like snap beans, for the table, or when green shelled for the same purpose. When ripe, they are not good for human food. Planted at the same time with Lima beans, they will ripen first. The seed of the first crop ripens in time to allow the planting of a second one. The Lady Pea is small, nearly white, and when dry, is much used for the table. The Sugar Crowder is much larger and more prolific than the Lady, and, like it, is much esteemed for table use. It is a climbing or trailing sort. The Black Pea is used for feeding stock. It is a vigorous, strong grower. The Clay Pea is also a strong grower and prolific. The seed of this sort will not decay in the ground during winter, that which may fall from the vines coming up freely the following spring. This variety is used only for feeding stock. As seen above, some varieties are good for human food and all are valuable for feeding stock, either shelled out or left on the vines to be cut and cured as hay. They will grow on poorer soil than any other crop, and afford a larger amount of vegetable matter which may be turned under to enrich the soil. Growing so rapidly and luxuriantly, they completely smother out all growth of grass and weeds. They are planted the same time as snap beans and cultivated the same, except when wanted to be turned under.

Dairy Husbandry.

WINTER BUTTER MAKING.—No. 2.

HENRY STEWART.

The Cow.

BUTTER making begins with the cow; one cannot make the best butter from a poor cow There are cows from which the best dairymen and dairywomen will fail to get good butter, especially in the winter time. One may be sure of success if he has a good pure-bred or grade Jersey or Ayrshire or Guernsey cow, and some native cows will make equally good butter. But some will not, and the best of them are improved by a cross of either of the above pure breeds. The dairyman, then, who would excel in producing fine butter in the winter time should weed out from his herd every cow whose cream is white or specky, or apt to become bitter, or that may sometimes foam in the churn. He should also have fresh cows, for the cream from a fresh cow will be of a much higher color than that from a farrow cow, or even from one that has been milking three or four months. Having made a selection of cows, the next thing in order is to feed them on the right food, to secure firm, hard, yellow butter, having the waxy grain and high nutty flavor so essential.

The Food.

The food has a most important effect on the quality of the butter as well as the quantity, and both the selection and the quantity of food given deserve consideration. A few tests of foods made by myself personally, without any intervention of a hired man, and in which the feed was given, the cow milked, the milk weighed and skimmed, and the butter churned and weighed by my own hands, may be given. In February last my cow, Minnie, was fed upon the usual ration of 10 pounds of meal of corn, oats and wheat bran ground together; to this were added six pounds of palm nut meal daily. Feb. 1st to 7th the cow gave 161 pounds of milk which produced eight pounds of butter; Feb. 8 to 14, the milk was 191½ pounds and the butter 9¾ pounds; Feb. 15 to 21, the milk was 194 pounds, and the butter 10¼ pounds; Feb. 22 to 28 the milk was 198½ pounds, and the butter was 12 pounds; the meal was discontinued because the butter deteriorated in quality somewhat.

A test with cotton-seed meal gave the following results A two-year-old Ayrshire cow, Bolivia, fed previously on 10 lbs. of corn, oats and bran meal daily was given four pounds of cotton seed meal. The yield was as follows:

			Milk.	Butter.
Nov.	1 to	7	126 pounds.	5⅞ pounds.
"	8	14	129 "	7¼ "
"	15	21	128 "	7⅛ "
"	22	28	132 "	7 10-16 "

The color of the butter and flavor were much improved by the cotton-seed meal. The last-mentioned yield of butter is still maintained.

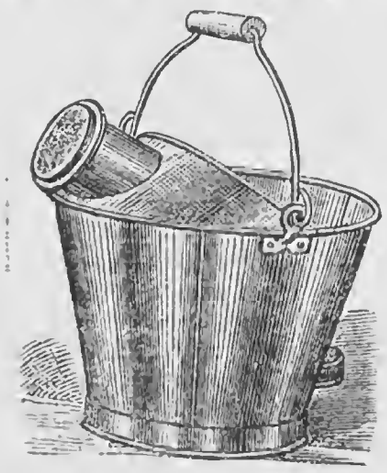
After very thorough and long-continued tests of every kind of feed attainable, I prefer the following rations and kinds for the production of the best quality of butter:—Ten pounds of meal made of corn, oats and wheat bran or middlings, with four pounds of cotton-seed meal, given half in the morning and half in the evening with cut and wetted hay; at noon a feed of dry hay. If roots are at hand I would give a peck of these in place of the hay at noon. A handful of salt daily sprinkled on the feed is indispensable; the want of it will be discovered in the churning.

Milking.

If the quantity and quality of the butter depend upon the cow and the feeding, the milking may easily spoil all. This should be done in the most cleanly manner. It is impossible to keep cows perfectly clean and a stable entirely free from odors, unless all the income is expended in the attention that would be needed. But yet the milk may be kept clean if the stables are cleaned out and freshly bedded before milking, and the cows are carded and brushed off and the udders wiped with a clean cloth. Some impurities, such as loose hairs and dust, *will* get into the milk in spite of all care, but these may be kept out of the butter. An excellent milking-pail, which I have recently tried (Dodge's patent, fig. 10), strains the milk perfectly, from every hair and speck of dust; it is easily kept clean and promises to be very durable. The strainer may be made of one, two or three thicknesses of wire cloth, and can be unscrewed for washing.

Setting the Milk.

Upon the setting of the milk depends the quantity of the cream raised, as well as the quality of the butter. The difference between deep and shallow setting is too small to be perceived by the most careful tests, excepting as regards convenience. The deep-can system is convenient under certain circumstances, and in some is indispensable; but I prefer shallow setting when all other things are equal. All these things are equalized and more by the Ferguson Bureau Creamery, which is the most convenient shallow-pan system I have met with. This consists of a closet with shelves for the pans inclosed by glazed or wire-gauze doors, a place below for the cream and butter and one above



DODGE'S MILK PAIL—FIG. 10.

for ice. The temperature may be maintained the year round at any desired point; the milk and cream are thoroughly aired and exposed to light; and the closet may be kept in any place that may be desirable. For usefulness, and labor-saving I have met with no more effective plan than this. But with whatever system of setting is used, the requisites for first-quality butter are purity of air, sufficient ventilation, moist but not damp atmosphere, and freedom from any odor whatever, with a temperature not below 45 and not over 60 degrees. The cream skimmed every 36 hours should be stirred in the cream jar each time that fresh cream is added, and should be kept as purely as the milk.

There is a dispute respecting the churning of sweet and sour cream. Sweet cream will make delicious butter, and preferable for immediate sale; but this will not keep so well, nor has it that ripeness of flavor and peculiar nuttiness, which butter made from sour cream possesses. Sour-cream butter may be kept for a year or more and may improve with age to some extent for a few months, while sweet-cream butter should be eaten in a week after it is made. Thus it depends upon the manner of disposal, if one should churn sweet or sour cream. But the acidity of the cream must not be excessive. In the winter, if kept at a temperature of 50 degrees, the cream may be churned once a week; if kept longer, there may be trouble in the churning.

Can Fatness in a Cow Lessen her Milk Yield?

That cows may be too fat to give a full flow of milk and hens too fat to lay, is a current opinion among farmers in some sections, which is an absurdity, it seems to me; the fact being that the cow or hen gets fat on account of non-production, not that the yield of milk or eggs is lessened by the accumulation of flesh. Cows take on flesh when supplied with rich food beyond their capacity to convert it into milk. Certain articles of food have a tendency to produce milk, while the fat-forming qualities of others are predominant; yet were a cow allowed so small a ration of any kind, that she would decrease in weight, the production of milk would not be increased thereby; but, on the contrary, a diminished yield would be the result. There is a limit to the profitable conversion of food into milk; also a limit to the capacity of cows to secrete milk; but if, by high feeding with careful attention to details, we can get the same returns in four years that otherwise would require five, we are the gainers. It seems incredible that any thinking man could believe that a "cow would yield more milk when thin in flesh than when fat." M. B. P.

Turnips for Milch Cows.

Though the RURAL and other agricultural papers have told us "time and again" for the last twenty years, everybody does not yet seem to know that turnips in large or small quantities may, with impunity be fed to cows, *if fed at milking time*, I have used them as cow feed for years without the least taint being perceptible to taste or smell in milk or butter.

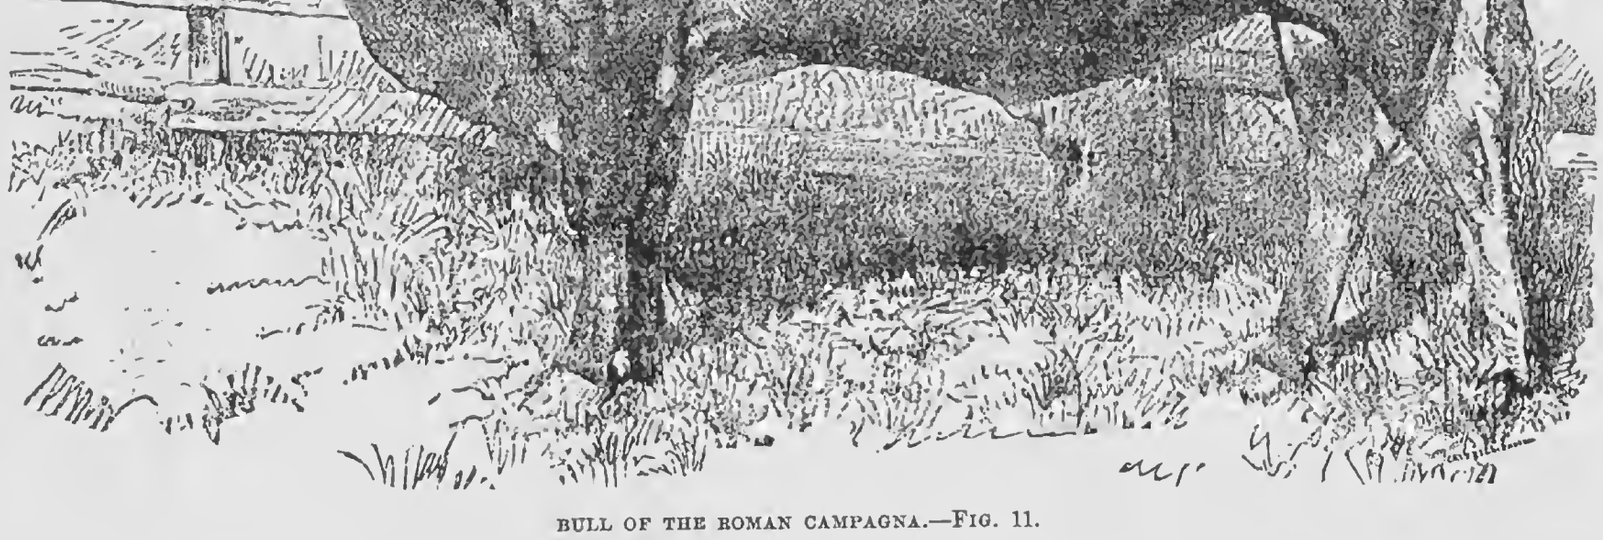
The Herdsman.

OUR ANIMAL PORTRAITS.

THIS week we present to our readers a couple of very suggestive animal portraits. One is a descendant of a race that was sung of by poets before the opening of the Christian era, and that has remained unchanged, so far as is known, since then; the other belongs certainly to one of the best established and finest of our modern breeds. The clumsey beast with the hollow back, the huge neck and brisket, the scarcity of flesh where it should be most abundant, and the generally ungainly form, is one of the famous animals that for ages have enlivened the Roman Campagna. The splendidly formed beast, with the straight back, the blood-like head, the heavy layers of flesh in those parts where the meat is the best, and the form approaching a square when viewed in front and behind, and an oblong when seen from the side, is a fine representative of the white-faced Herefords, which are lately striding rapidly to the front, especially among the raisers of beef cattle in the West. There's a lengthy article, which every farmer and breeder should carefully take to heart, in the study and comparison of these two animals, one the representative of the old unimproved race, the other the representative of our latest advances in the art and science of breeding.



BULL OF THE ROMAN CAMPAGNA.—FIG. 11.

LICE ON CATTLE.—I have not a doubt but the many remedies recommended in books and newspapers are effectual in disposing of these parasites, but they all require some time to prepare and use them, and if you will just stoop down and take a handful of earth (sand would seem to be the best) and rub it thoroughly into the hair among the lice, repeating it a few times, and use the curry-comb or card (which you ought to do anyway), I think you will find it just as effectual as the most elaborately prepared compound used in the most highly recommended manner. How this would do for ticks on sheep I cannot say, but I would use it in preference to the tobacco dip. Of its being an effectual remedy for the pests on horses and cattle, however, I can speak from experience. VIEILLARD.

THE HEREFORD HERD BOOK.—The publishers have adopted for the title of the above work, The American Hereford Record, and have made application to the Secretary of State of Illinois for permission to form a stock company for the publishing of this and such other works as shall seem best to advance the interest which they represent.

The Record was in the hands of the printer by the 1st of January, and will be placed before the public at an early day. It will contain 2,300 pedigrees and some 50 or more pages of reading matter, giving a sketch of the progress of the Hereford breed of cattle and their relation to other breeds.

The English Hereford Herd Book Society has issued the 10th volume, which is just out. The American work will be complete in itself; every pedigree will trace as far back as the record goes.

The Swine-Herd.

ESSEX PIGS; ORIGIN AND CHARACTERISTICS.

COL. F. D. CURTIS.

ESSEX pigs, like the Berkshires, originated in England, and take their name from the county where they were first bred. The older pigs of Essex were cross-bred and were generally spotted, or black, with white patches. They were in no sense a breed, but were the result of crossing black pigs with the native white ones. It is claimed that these crosses, which do not seem to have been popular, were made with a black breed called Sussex, another county name, or with the Berkshire — probably more with the latter than any other. Just such hogs could be produced any time in America, by crossing Chester Whites, or any coarse white breed with Berkshires, and selecting the spotted or patched ones for breeding. The Essex pigs do not seem to have had any special or peculiar merits until they were crossed upon the Neapolitan, a distinct black breed native to the peninsula of Italy. The most marked early improvement was made, according to English writers, by Lord Western, who had imported a pair of Neapolitan hogs previous to 1839. This enterprising gentleman soon had the white spots bred out of his crossbred pigs, which were really grade Neapolitans. By continuous breeding in a direct line (which was followed up carefully by Mr. Fisher Hobbs, a tenant on the Western estate, who established a number of families of these grades, and then bred them together), the improved Essex became, after a number of years, pure-bred Essex.

Pigs of Mr. Hobbs's breeding have, with success, been imported into this country, originally by Samuel Thorne, a farmer merchant of New York, and their descendants have been scattered quite extensively. The Essex, as now bred, have a more dished face (hollowing in) and shorter noses, than those first imported, and they are not so large in body and bone. This is probably owing to the want of new blood to cross upon, and to the fact that the young pigs are kept too fat, which creates an undue proportion of fat to bone. A renewed cross with the original blood, the Neapolitan, would impart renewed qualities to the Essex, and we are expecting to see this done before long, as in our judgment it would be wise so to do, and if not done by American breeders, it will be likely to be by the English, as they understand the art of improvement by out-crosses. As the Neapolitan pig is entirely black, there would be no change in the markings of the Essex, the color being now pure black, with small, upright ears, a light coat of hair, no bristles, round, full hams and wide shoulders, short legs, short neck, full cheeks and broad backs.

The Essex hold the same relation to the black breeds, which the Suffolk or the Small Yorkshires, do to the white breeds. An Essex boar is valuable to cross upon coarse-bred sows, as the offspring will fatten easily and mature much earlier than the blood of the sow. The females are naturally prolific mothers, when not too closely inbred, and are docile and kind. Essex pigs possess the virtue of hardiness, and, like other black breeds, freedom from mange. Color will not protect hogs from lice, but white hogs are far more liable to be affected by mange, which is caused by an insect so small that it is not discernible to the naked eye, burrowing under the skin. The pure Essex is a handsome, round, plump pig, and easy to keep. Like the Suffolk, the young pigs are small at birth, but after a few weeks, grow and mature rapidly. The skin of the Essex, like that of the Berkshire, is, when dressed, a bluish-white. The Essex are excellent for a hot climate, as they do not blister easily. They possess the general merits of quietness and aptitude to fatten on a small amount of food, the prejudice against their black color, being more notional than rational.

OWING to the trouble between the employes of the packing houses of Chicago and proprietors there has been an enormous falling-off in the receipts of hogs there. The first week after the strike only 42,669 arrived against 142,926 for the previous week; and 162,404 for the corresponding week last year. Many of the hogs that would have gone there are still at home; but a great many more have been sent to other markets.

The Poultry Yard.

KEEPING POULTRY IN WINTER.

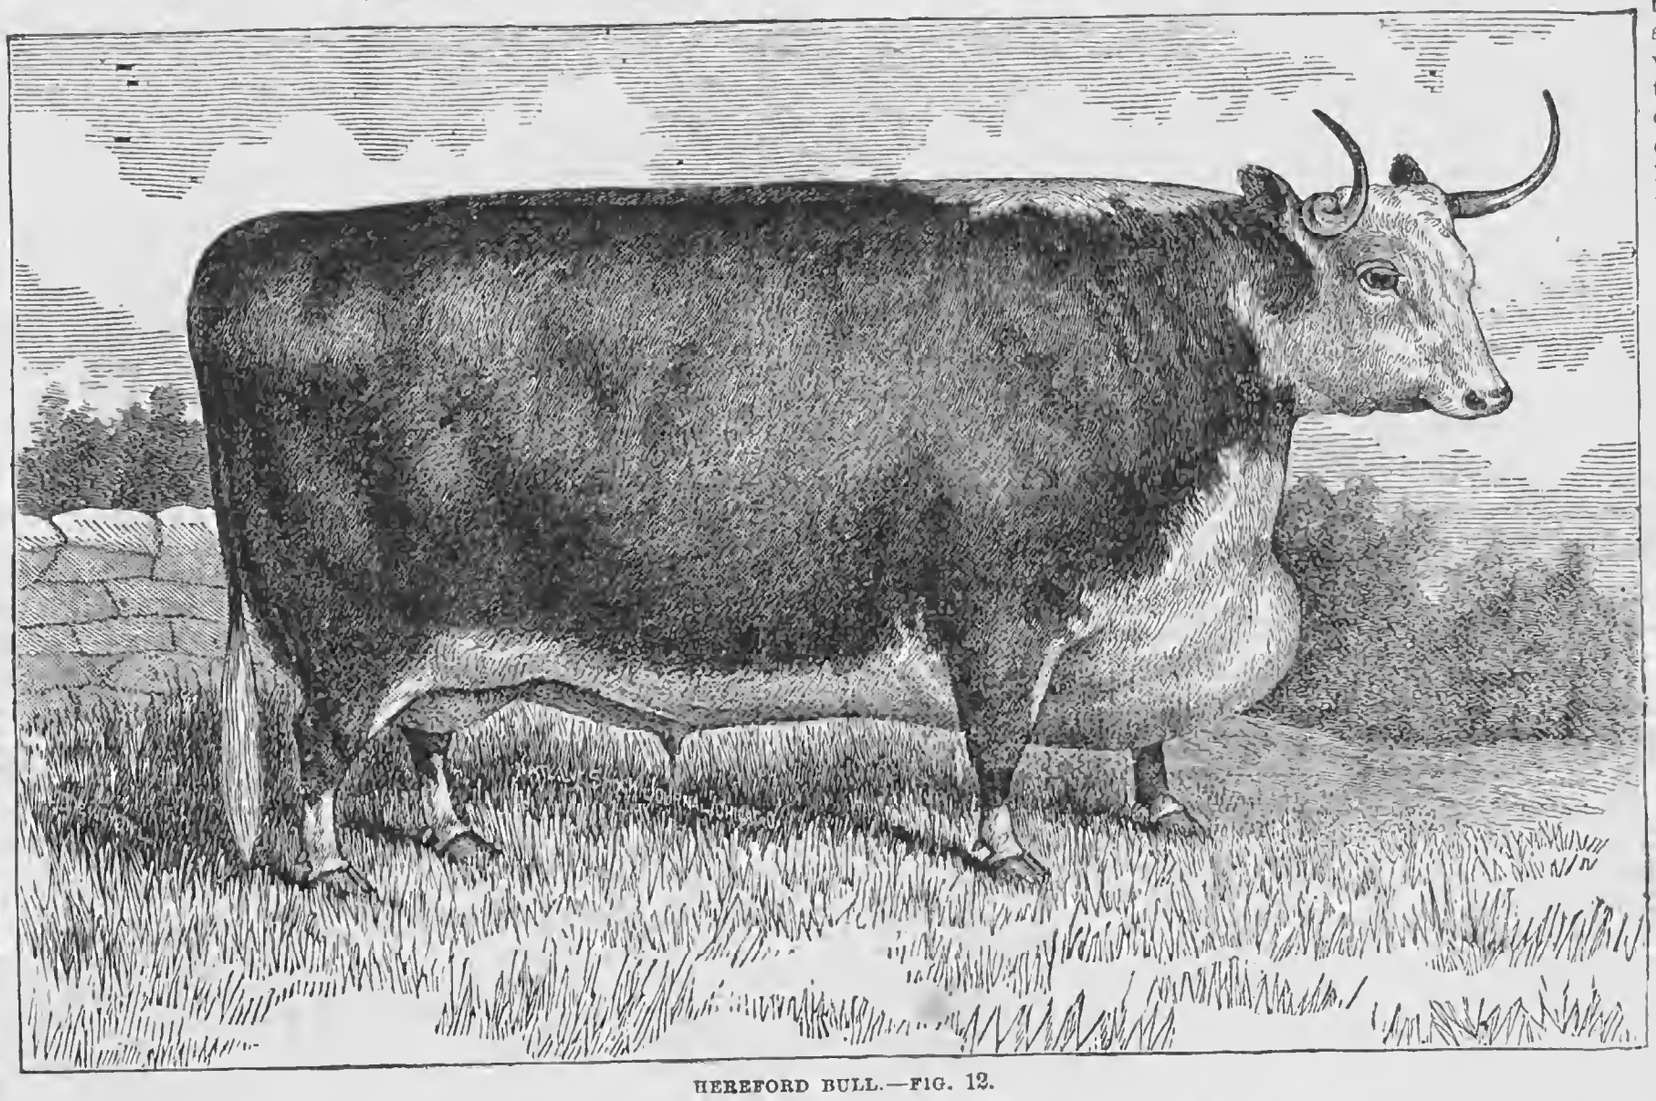
FORREST K. MORELAND.

Poultry-raising in a climate where the thermometer at one time indicates 30° below zero, and in less than 24 hours 30° above zero, must necessarily depend for its profits, to a great extent, upon the hardiness of the fowls kept. This is one of the essentials in poultry-raising. What matters it how large our chickens are or how profitable they may be as egg-producers if they are not adapted to our rigorous climate? I have frequently heard my neighbors boast of the innumerable good qualities of their different breeds of poultry, and too often add, "But they are a great trouble in winter; they won't lay and very often they freeze to death." It is too true that the greatest fault is very often in the hen-house. No breed of fowls ought to be expected to live in this climate, in a building where the snow flows in at every crack. But, no matter what ought to be, we have to consider what is, and, if that is an evil, to suggest a remedy if such a thing is possible. The large, fast-growing fowls are not as vigorous as the more active ones. Their habits are more sluggish, and they do not take sufficient exercise in extremely cold weather. Take a fowl whose legs are covered with feathers, although these are a questionable ornament to my way of thinking, yet in winter they become a great inconvenience, as they catch all the filth and snow, if the fowl is allowed to go in the snow, as a hardy fowl should. A large fowl is chilled much too easily in cold weather. I do not mean dangerously chilled, but chilled so that it loses a desire to help itself, and sits around on the ground, growing worse all the time, and liable to be stepped on and killed.

Of those classed as large breeds there are some active ones, but the rule is that a good growth and large size are incompatible with active habits and a hardy constitution. Take fowls that are very active, great foragers from early morning until late at night and from early spring until late in the fall able to take care of themselves and even a little troublesome to the neighbors, and you have birds that are rather hard to freeze, and which, under any decent sort of treatment, will lay through a good share of the winter. When the poultry-yard is so situated that there is no chance of annoyance to the neighbors, or of damage to gardens and crops, there is much more profit in keeping fowls that forage for themselves than those that require regular feeding. The former wander all around the barnyard and fields, scratching and picking up seeds that would be lost, and worms that would not be lost. They live in this manner instead of requiring corn at 75 cents per bushel, and always make a good return in eggs.

I have kept for several years the Golden Polands and have never made but a slight outlay for grain in summer. Were it not for their very active habits they would be quite unfit to stand our climate. As it is, their value for the table and as layers and non-sitters makes them well worth a little extra care. They are better adapted to stand our winters than some breeds, and not so well adapted as others. I think the American breeds are much better fitted to stand cold weather than the Spanish or French. But no breed of poultry can stand what some breeds on some farms are required to stand. Hen-houses can be erected at very small cost, warmth, with an abundance of light and good ventilation, is all that is required. I have seen very good henneries constructed from some building that was useless for any other purpose. Take an old frame of this sort and double-board it and line it with sawdust or tan-bark, and, provided the work is done well, you have a cheap and good hen-house. I do not propose in this letter to give a plan of a hen-house, but merely to offer some suggestions for the benefit of poultry for the winter. One side of the house should be glass; double if possible—it will be a means of heat as well as light. The house should be made as comfortable, and all cracks and holes should be closed and made as tight as possible.

Hens may be kept in the warmest hen-house, even in one warmed by artificial heat; yet if they are not fed, there will be no eggs. I have for years followed the practice of giving the hens all the meat scraps, egg-shells and vegetable refuse from the kitchen; it pays much better than to feed the same stuff to the pigs. Hens are very partial to meat either raw or cooked, and they also like vegetables in the same way. But more than this—such a mixture of food is healthful and greatly tends to increase the production of eggs. As all this kitchen refuse is well adapted to the needs of fowls, it will yield a much better return if given to the hens than if used in any other way. If they are fed a clear dish of corn, barley or oats, their appetites are very apt to become cloyed, and themselves to fall in vigor and fertility. In winter they should be fed a sufficient quantity of heat-producing food. Of this corn or barley is the best, and the kitchen refuse before spoken of, will furnish the necessary meat scraps. If meat can be procured in no other way, certain portions of carcasses can be procured at the slaughter houses, very often for the asking. If meat cannot be procured without buying, the health and productiveness of the hens will warrant the purchase of an occasional piece for them, though not of a porter-house steak or a roasting piece perhaps. If hens are unhealthy or lacking in vitality, there is no profit in keeping them.



HEREFORD BULL.—FIG. 12.

HOW TO MAKE HENS LAY IN WINTER.

To get a plentiful supply of eggs in winter, young hens are necessary. Pullets hatched in April and May will prove most satisfactory. The hen-house must be warm and kept clean. Provide plenty of fresh water always. A variety of food is absolutely necessary, but wheat or screenings should be the main feed. Corn has more fattening than egg-producing properties, and should be fed sparingly. Buckwheat is valuable feed for hens. Oats are not worth much, but will do to make out the variety.

Feed in the morning a warm mess of meal, middlings, or something of that sort, mixed stiff, but feed no soft feed after the middle of the day. Only dry grain should be in a hen's crop upon going to roost. Fresh meat must be fed. Lard or tallow scraps are good; both can be bought at the soap factories, the former costing $2 and the latter $1 per hundred. Scraps should be broken up and soaked over night, warmed, and fed in the morning. Meal may be added. Hens also require vegetable food. Carrots are best; chop as fine as kernels of corn, and about twice a week add a few onions. For shell material use oyster or clam shells, both browned and raw. Break them fine. Keep plenty of fine sand where your hens can have full access to it. Another important consideration is, make no sudden change in your manner of feeding, as every radical change diminishes the supply of eggs. Provide plenty of nests, and never allow your hens to be chased by boys, worried by dogs or frightened in any way. Perfect quiet must reign in the poultry house, or eggs will be scarce. Let no one who has neglected his hens expect a full supply of eggs immediately after commencing a systematic course of feeding. It will take weeks, perhaps months, before the best results will be realized. N. B.

Sheep Husbandry.

Advantages of Using a Pure-bred Ram.

I HAVE been in the sheep business on a small scale for several years, having commenced with ewes that would shear 4½ pounds of wool. I bred on in this way for some time, but found it did not pay so I purchased a thoroughbred buck for which I paid $40. From his first cross with the ewes I got a set of lambs whose clip averages six and a half pounds each; now I have ewes that will shear from eight to ten pounds of washed wool. At present I get three pounds of wool per head more than I did before I got my buck, and as I keep about 150 sheep, it gives me 450 pounds extra, and that, at 35 cents per pound, will give $157.50 extra. This is not for one year; but for as long as they live—say ten years. In that time the extra gain from the use of my thoroughbred ram would be $1.575—a nice profit. But that is not all. I can sell my sheep for about one-third more, and still there are thousands of farmers that will not pay $25 for a ram! My advice would be to all young beginners, to use none but thorough bred rams. If they are not able to get one themselves, they should hire the use of one or join with a neighbor and purchase one, and as soon as each is able, he should get two or three thoroughbred ewes; then he can raise his own bucks. I hope to hear from some good sheep-breeders through the RURAL.

Monroe Co., Ohio.

Various.

A LETTER FROM MR. F. B. THURBER.

NEW YORK, Dec. 30, 1879.

EDITOR RURAL NEW-YORKER:

DEAR SIR:—My attention has just been called to an editorial in your paper of Dec. 27, entitled "Specimens of Oleomargarine," which I think does both the managers of the Dairy Fair and myself an injustice, inasmuch as it carries with it the idea that it was an advertising dodge of the manufacturers of that article, and expressly states that the "President of the Dairy Fair is interested in its manufacture, and is the largest dealer in the stuff in the country."

I desire to state that this action of the managers of the Fair was taken during a four days' absence, and I knew nothing about it until I found it on exhibition when I returned. On inquiry, I found that so many dairymen had manifested a curiosity to see it, that the managers had purchased specimens of different manufacturers, and exhibited them as an interesting feature of the fair, so that the action could not be attributed to any desire of the president to advertise the article.

Regarding the other points upon which I think your article does me injustice, you evidently entertain the impression that the firm of which I am a member, is substantially the Commercial Manufacturing Company, which is perhaps not to be wondered at, because a statement to that effect was made at one of the meetings of the butter merchants at the American Exchange a short time since. This, however, is incorrect; neither myself nor my firm, nor any member thereof, owns a dollar's worth of stock in that company; our sole connection with it having been to make advances to it and sell its product on commission, its entire product up to the time of the great advance in the price of butter having gone abroad.

Interested parties have also sought to convey the impression that we have sold it fraudulently, or contrary to law, which also is not true. We have looked upon it simply as a commercial product as legitimate as lard, and the only wrong in its sale, in our opinion, is where it is sold for butter, which my firm never has done. I have no doubt from what I have heard and seen, that some manufacturers have done so, but I think you will admit that a firm doing its business in an open, honorable, and lawful manner, should not be blamed for the sins of those who do not do their business in that way.

You are also in error in stating that either myself or my firm is the largest dealer in oleomargarine in the country. There are at least two or three establishments in other cities that manufacture more oleomargarine than the Commercial Manufacturing Company, although the quantity manufactured has been largely over-estimated, and I think that you, as well as others, have over-estimated its effect on the butter market.

The late meetings on the subject were held at a time when the butter market was experiencing a natural reaction from an advance of over one hundred per cent. I think it was this rather than oleomargarine which was responsible for the weakness of the market at that time—a conclusion which I think the present strength of the market confirms. I do not think as you do, that oleomargarine "has inflicted and is still inflicting a monstrous injury on the dairy interests of the country." On the contrary, I think it is producing a beneficial effect upon the dairy interests of the country, the same as it has in Europe, by attracting the attention of butter makers to the necessity of improving the quality of their production, for which I think you will admit there is ample room. I think if you will talk with the leading men in the butter trade, you will find that my firm, as well as myself individually, have done as much work and expended as much money in advancing the dairy interests of this country as any other firm or individual, and I certainly would not be interested in any business, especially an unlawful one, which was calculated to injure the dairy, or any other legitimate interest. If lard were manufactured and sold as butter I should say it was wrong, but, on its merits, lard is a legitimate article of commerce, and the interests of citizens interested in its production are perhaps entitled to as much consideration as those of any other class.

Farmers are stock raisers as well as dairymen, and it seems strange that they should object to a new outlet for one of their products, except upon the basis that it is fraudulently sold in place of another. I believe this is the view taken by the leading dealers in dairy products, and that they prefer that if oleomargerine is to be manufactured, it should be sold by houses who do their business in an open and above-board manner, as we do.

It is also now understood by the leading butter men that the extraordinary efforts made by parties outside of the butter trade to stir up an anti-oleomargarine excitement, were made to serve an ulterior purpose, for which they do not propose to be used.

Respectfully, etc.,
F. B. THURBER.

CASH VS. CREDIT. I have been much interested in the articles that have been published in these columns, on the above topic, and certainly hope they will be the means of doing much good. Debt is one of the greatest curses that the farmer has to contend with, and it is not realized until it is too late. Before a man gets into a debt he should make some calculation to pay that debt, but far better is the plan to never get into debt, even if you have to suffer many disadvantages in consequence. "Owe no man anything" is one of the farmer's best mottoes. F. H. D.

Everywhere.

NOTES FROM CENTRAL NEW YORK.

ANOTHER season has passed, and in many instances, it has been a remarkable one in this section; the drought of 1879 has been the most severe ever known in this portion of the State, yet the crops, as a whole, have been abundant in quantity and fine in quality. Many former years of more copious showers have not produced so good crops as a whole as the past, thus showing that while the drought was of long continuance and very severe, there have been other causes that have operated favorably to the production of fine crops. Of these one prominent cause may have been the better preparation of the soil, and the better tillage of the crops. One thing is certain—that those farmers who fitted their grounds last spring in the best manner and followed up the after-cultivation in the same thorough way, determined to raise less weeds than heretofore, have been quite successful in their crops, especially if the ground was made rich by the application of manure, whether made on the farm, or commercial fertilizers sold in our markets. The hay crop was not as heavy as some years; but was of good quality. Oats, which are our principal spring-sown crop, were above an average yield. Wheat, also—what little we have sown in this section—was good in quantity and quality. The past three years have been very favorable for wheat, and more has been raised hereabouts than usual. The past fall has been no exception to this rule in the putting in of the crop for the harvest of 1880, and at the setting in of winter, the prospects were favorable for a bountiful harvest next July. Although our wheat fields are not large, the crop was put in well last fall, and has made a fine growth to withstand the winter. If that should prove favorable, we may look for another good yield the coming harvest. Corn, on well manured fields that were well tilled, was a good crop. Potatoes were fully an average crop in quantity, and extra in quality: some cultivators say they are better than they have been in twenty years, but that is saying too much, in my opinion: but it is true we have had a good crop. Apples are poor in quality and few in quantity compared with last year's yield, when they were abundant and excellent. The dairy is the absorbing interest in this section, and all the earliest and mid-summer sales were low, consequently the dairy farmer has had a hard season; many tenant farmers will hardly pay their way. The fall prices of both butter and cheese have been liberal, but the product was small from the effects of the severe fall drought. We are now hoping for a more prosperous season in 1880 wherein the dairy products will be more abundant, and the prices more liberal during the season. The farmer who raised hops this year was the fortunate man, as the crop has been of general good quality, and fairly abundant in quantity on well tilled fields for so dry a season, and the price has been good. A few sold too early and too cheaply; but, on the whole, better prices have been realized for the hop crop by the grower than for any other raised in this section. J. TALCOTT.

Rome, Dec. 22.

RURAL SPECIAL REPORTS.

ILLINOIS, Baileyville, Ogle Co., Dec. 24.—The year is closing auspiciously. We had a pleasant fall, favorable to the maturing of the late crops and for field work. The weather was dry, with only occasional showers that kept vegetation from suffering until Nov. 26, when a wet spell set in which continued until Dec 10, and completely saturated the ground and replenished the cisterns, wells and streams, so we have no fears of a water famine soon. The ground is now covered with snow, but there is not enough yet to make good sleighing; it is snowing a little to-day. The corn crop was about all cribbed in good condition by the 20th of November; the yield was large and the quality excellent; but there was hardly as much as last year. The average yield, I think, in this section, was about 48 bushels per acre—shelled. Some *fields* were much better than others, according to fertility and the manner of cultivating the crop, and consequently the yields varied greatly—some being as high as 75 bushels per acre, and others not over 30 or 35 bushels. This shows the difference between good and bad farming. The autumn work was all done in due season, and the farmers are well prepared for winter. Live stock in general are healthy and in fine condition. Winter wheat and rye made a vigorous start this fall, and the prospects for them at present are promising. The recent advance in the prices of grain and provisions has revived business greatly, and the times are much brisker here now than at this time last year; but strikes in Chicago last week at the stock yards, among the laborers, have caused a slight reaction and most likely we shall not have another boom in business until after the holidays, if even then. W. B. D.

INDIANA, La Porte, La Porte Co., Dec 26.—The Cow Pea, I think, has been grown on my place for several years by colored people from North Carolina, and has succeeded as well as the common white bean. To us the RURAL is a standard work. The back numbers are just as valuable as the latest, and although my time is valuable, yet I feel it a duty to try as far as possible, to induce my neighbors to share in the advantages it has brought us, by enrolling themselves on the list of its subscribers. J. S. B.

NEVADA, Tuscarora, Elko Co., Dec. 12.—We have had remarkably mild weather here the past two winters, very little snow falling in the mountains, consequently water has been very scarce this year, and as we have no rains during the summer months crops have suffered for want of moisture. For this reason potatoes have yielded poorly, they will average about two tons per acre in this valley. The Beauty of Hebron did exceedingly well taking everything into consideration. I planted seventeen hills the first week in July, one eye in a hill; three of the pieces did not grow, leaving fourteen hills at digging time. The eighth of October the yield was 31 pounds of large and small potatoes, and more than double the yield of the same number of hills of either Early Rose or Early Ohio. As to earliness I cannot say, as I did not plant them the same time with other varieties. Of the other seeds sent me by the RURAL, the Hollyhocks are doing well. The Bronze Ricinuses were cut down by frost early in the season. The Aquilegias come up very well, but have not grown very much this season. The Defiance wheat was looking very well, but was pulled up by mistake. The other seeds started well, but owing to the dry hot weather they were all killed. We are having the heaviest storm that has occured for a number of years. It commenced ten days ago, and has been raining, blowing, and snowing by turns ever since. We have had some cold weather; the coldest day the thermometer stood at zero. F. A. B.

NEW YORK, Clyde, Wayne Co., Dec. 22.—The RURAL'S Bronze Ricinus, I must say, I am delighted with. It was a beautiful ornament of our flower-garden throughout the summer, and late last autumn by being protected from one frost in September. I have purchased packages of Bronze Ricinus of seedsmen at different times In every instance they failed to give me satisfaction, and I had concluded that a fine Bronze was a mith. But the new RURAL Brouze is a jewel. The Hibiscus Moscheutos and militaris, Crater's Lemon Hollyhock, and other seeds germinated and grew finely. Blount's White Prolific corn I think from my trial with it, is not fitted for this latitude. 43° north. The frost held off unusually long this autumn, else not a single ear would have ripened; as it is, only a few reached maturity. Although the enormous 10 to 14-feet stalks produced from three to eight common to very small ears each with a large cob, yet I have an opinion that Blount's corn is not on the right track to produce the greatest amount of shelled corn to the acre. I believe there are kinds of corn peculiar for growing large, long ears with exceedingly small cobs, two ears of which will produce more shelled corn to the acre, than eight semi-ears of Blount's Prolific. The stalks make quite a problem for a farmer who attempts to handle them in the same manner as common corn in this vicinity, while as a forage it cannot compare with many other varieties. However, it may give grand results and good satisfaction every way in the South and West. Clover seed thrashing is nearly done throughout this section. A very small yield is realized—generaly one-half to two bushels to the acre. Hundreds of acres were left uncut. The destroyer of the clover crop is the worm of a fly closely allied to the Hes-ian fly. It is the Cecidomyia leguminicola so named by J. A. Lintner, of the New York State Museum. It was first noticed in the same locality in which the Hessian fly made its appearance this last time—Seneca and Tompkins counties. This is the first year it has been noticed in Wayne county and it is not known now in the northern part near Lake Ontario. In that section Mr. E. M. Smith, of Sodus, raised 75 bushels of clean seed ("big kind") from 10 acres of land. Where the worm is at work in the blow, a field never has a red appearance in blossoming time, although there may be abundant foliage. I judge the fly is spreading at the rate of thirty miles per year, and, of course, will eventually reach the clover areas of the West, unless checked by parasites or some destroying epizootic. Barley has not quite met the expectations of the farmers, the prices never changing from 50 to 75 cents according to quality and kind. More profit is expected from oats, now 43 cents. Wheat is nearly all marketed. Hardly any corn has been sold—price 50 cents. W—X.

FULLER'S STATION, Guilderland, Albany Co.—We are having very cold weather, the thermometer was down to six degrees below zero yesterday morning. To-day we have about six inches of snow, it will make fine sleighing. Farmers in our section are in better spirits this year than last. We are getting from $8 to $12 a ton for hay, and from $16 to $18 for rye straw at the station. Cattle and sheep are in better condition this winter than last; our rough fodder is cured much better this year. I believe in stabling my cattle and sheep as I can winter them on one-third less feed than if they were left out in the yard. I use saw-dust for bedding. I think it is much better than straw; it absorbs all the urine thereby saving a valuable fertilizer. I have tried it several times, and am convinced that the mixing together of the droppings and urine makes a good strong manure. The rye and wheat in our section are looking much better this winter than last, as are also the meadows. I buy cattle at West Albany and winter them and sell them again in the spring to feed on my clover hay, cornstalks and straw, thereby keeping these at home for manure, which I find pays much better than to draw them off of the farm.

A. L. M.

OHIO, Youngstown, Mahoning Co., Dec. 24.—The summer was dry. Fall was middling dry and warm, and nice to do fall work. Winter commenced warm and moist. We have had very little snow yet, but lots of rain. Crops and meadows were middling good. Wheat yielded about 15 bushels to the acre. Corn was two-thirds of a crop. But, oh, my! How my prolific corn grew and grew. I thought it would never stop growing. Finally it tasseled out. Then came the ears, from one to six on a stalk, from six to nine feet up in the air. It is too late for me. Oats were half a crop. Potatoes half a crop. Wheat, $1.40; oats, 40c.; corn, in the ears, 35c.; potatoes, 55 to 60c.; butter, 20c.; eggs, 20c. I. S.

The Querist.

ANSWERS TO CORRESPONDENTS.

A Bushel, Etc.

J. A. D., Millville, N. J., asks 1, what is the cubic measure of a bushel of ear corn; or, in other words, what is the rule for ascertaining the number of bushels in a bin of ear corn; 2, what is the rule for ascertaining the number of bushels of corn in the ear and unshucked in the bin. 3, He also wants to know where the Lady Washington and Duchess Grapes can be purchased.

ANS.—The English Imperial bushel contains 80 pounds of distilled water, weighed in the air at a temperature of 62 deg. F., and the barometer at 30 inches, and it measures 2,218.-192 cubic inches. In New York the standard bushel is declared to contain 80 pounds distilled water at its maximum density, but elsewhere in the United States the Winchester bushel has been generally adopted. This bushel was in common use in England to the year 1826, and holds 77.6274 pounds of distilled water at 39°8 F. and 30 inches barometric pressure, or 2150.42 cubic inches. Now, a cubic foot contains 1,728 cubic inches, and dividing 2150.42 by this number, we have 1.2386 cubic foot or 1 foot and 422.42 cubic inches as the contents of a bushel. To obtain the number of bushels in a certain bin, find the cubic measure by multiplying its length by the product of its width and hight in inches, and divide the number by 2150.42, the number of cubic inches in a bushel. 2. We are not aware that there is any rule for finding the number of bushels of unshucked corn (we suppose that by this term is meant that the corn is not husked) in a bin, and do not see how there can be, as there is more husk on some varieties than on others. 3. The Lady Washington Grape originated with James H. Ricketts of Newburgh, N. Y., and we suppose can be bought of him; for the Duchess apply to J. T. Lovett, Little Silver, N. J.

Hogs Troubled with Indigestion.

D. B. S., Greenville, Ky., says he has a lot of hogs he is trying to fatten. He gives them all the corn and corn meal they will eat, yet they are not gaining as they should. They are apparently in good health, only that sometimes they will stop eating corn and begin rooting up and eating dirt, and he asks whether the dirt is injurious to them and what must he do to make them "all right."

ANS.—Hogs are often troubled with indigestion, and when this is the case, they will not eat well. This condition of the stomach is sometimes caused by over-eating, or by being fed food which is too rich. When hogs are thus affected they will not eat a large quantity, and if they do, it seems to do them but little good. The fact that these pigs eat dirt goes to show that their stomachs are disordered. They should have all the charcoal they will eat, which will correct the acidity in their stomachs and promote appetite. Feed sulphur and give them access to salt. They will not eat enough of either to injure themselves. Give them half the quantity of corn meal and mix wheat bran with it for a change. A few roots would be healthful and strengthen their appetites. Give plenty of drink.

Agricultural Reports, Etc.

S. W., St. Clara, W. Va., asks: 1. whether Chester Mammoth Corn is a white or yellow sort. 2 How to procure the Reports of the Department of Agriculture.

ANS.—1. We do not know the variety. 2. The Agricultural Reports are printed at a heavy expense to the public, for free distribution, presumably "where they will do the most good." Those who have the management of their distribution seem to think that this is in second-hand book stores, or in the warehouses of dealers in old paper; and, so far as we can see, the easiest way for an ordinary farmer to secure a copy is to send an order for it to some extensive dealer in old books. Here and there some farmer who is in the habit of sending in reports to the Department of Agriculture at Washington, gets a copy direct from that quarter, but by far the largest proportion of them are distributed among the Senators and Congressmen, to be again distributed by these among their constituents. Those who may be anxious to get copies of the works and who do not like to seek them in the old book stores, should apply to the Congressman of their district.

The Dentaphone.

D. B., Chataugua Co., N. Y., asks whether the Dentaphone advertised in the RURAL is what it claims to be.

ANS.—Before admitting the advertisement we made careful inquiry as to the character of the device, and were assured it was really worth all that was asked for it. Since then, having received a number of inquiries, like the above, we have procured a specimen for personal examination. It is a small, neatly gotten up device, but on testing it on a couple of deaf friends neither could get any benefit in the way of hearing, from its use.

Miscellaneous.

M. E. S. Fulton, N. Y., asks, if it will kill an Oxalis and Geraniums to keep them in a dark, damp, warm cellar during the winter; 2, should Geraniums which are to be wintered in the pots, be cut back in the fall; 3, will Gladioli seed grow as well in a hot-bed as in an ordinary seed-bed?

ANS. 1, A dark, damp, warm cellar is not a suitable place for wintering plants. The warmth and moisture will stimulate growth in some plants and cause mold and decay in others. If the place were dry, it would be better. 2, Large Geraniums should be cut back in the fall, or in the spring before they start anew. 3, the Gladioli seed may be started in a hot-bed, but care should be taken in transplanting the young plants that they do not dry out too much.

Mrs. A. E. V., Carthage, (one of the dozen in the United States,) says 1, that her house plants have of late been troubled with the red spider for which she asks a remedy; 2, she has received a Salvia from a friend; it blossomed this fall, but now the leaves have fallen off and she wants to know what can be the trouble.

ANS.—The remedy for the red spider is to keep the plants in a moist atmosphere and to syringe them frequently with water. To wash them with water to which has been added a little carbolic acid is also effective. 2, Many Salvias drop their lower leaves in winter so that need be no cause for alarm. If the plant is dead we know of no restorative.

P. T., West Port, Ky., has an orchard which he intends to sod down. The trees are from 10 to 18 inches in diameter. He asks:—1, what mixture of grass seed to sow, and, 2, how many square feet in an acre.

ANS.—Equal quantities by weight of Kentucky blue grass, white clover and orchard grass. 2. 43,560.

J. B. R., Address mislaid, asks which is the best feed for milch cows.

ANS.—See articles on "Making Butter in Winter," in RURAL for Dec. 27 and in this issue. An excellent food for making milk consists of corn and oats ground together, equal bulks.

Geo. F. A., Brook's Grove, N. Y., asks where pure Narragansett turkeys can be had.

ANS—Though we have made several inquiries, we have received no definite information on this point. W. Cliff, Mystic Bridge, Conn., probably can supply them.

A Subscriber, Cornwallis, Oregon, asks if the American Book Exchange, 55 Beekman street, N. Y., is reliable.

ANS.—Business men who have dealt with this firm have assured us that they are thoroughly reliable.

W. H. P., F. B., C. S. A. and others. As remarked here last week we do not know at present where Southern Cow Peas can be obtained. They will without doubt be advertised during the coming season.

G. H. T. (no address) wants a remedy for white worms in pots of house plants.

ANS.—The best remedy is to give the plants fresh soil. Give lime water.

WHAT OTHERS SAY.

HYGIENIC.—A damp bed, or a draft of cold air acting on a heated and perspiring horse will often lay the foundation of a malady that utterly ruins his usefulness. Open windows and doors on opposite sides of the stable, or openings in the walls or floor should be carefully guarded against, especially when the horse has just come in from work. But in securing comfortable warmth, we must avoid impure air, from confinement of the breath or emanations from dung or urine. Cleanliness and sufficient openings for the ingress and egress of air, on one side of the stable only, or above the level of the animals on both sides, will guard against cold, while securing purity of the atmosphere. . . Large numbers of cattle die annually in the West from the lack of water when feeding in the cornfields. Dry corn-stalks, as compared with grass, are constipating food; but smutty corn-stalks are especially liable to cause impaction of food in the stomachs, and disease of the brain. The risk is largely, or entirely obviated if there is a sufficient supply of water; but when the water supply is frozen up the animal can no longer chew the cud from lack of water in the paunch to separate and float its contents, and impaction and a whole train of evil consequences follow. If water can be supplied so that the cattle can drink at will, it is better; but if not, it should be allowed abundantly at any cost, twice a day. . . While in many cases no other than iced water can be had, it is all-important that stock should not be left to become so thirsty that they will fill themselves when driven to drink, and then stand shivering in the cold stall or stanchions, where they are denied even the privilege of stimulating their circulation by walking about.—National Live-Stock Journal.

STOCKS FOR ROSES.—Jean Sisley concludes an article in the Country Gentleman on this subject thus: Many persons object that the stocks on which Roses are grafted offer the great inconvenience of suckers, and particularly the Manetti. The consequence is that there is always a struggle for life between the stock and the graft. But as the seedling brier is young, if a strong variety is grafted on it, the roots will give up, and the graft, by emitting roots, becomes, after two or three years, quite independent. This is not exactly the case with standards. These, on account of their age, being stouter, resist the influence of the graft, and as the suckers the standard brier endeavors to emit are continually destroyed, the stock cannot live, if the graft is not a strong variety, and if it is pruned as usual; because the roots of the standard do not receive sufficient aerial nourishment from the graft. That is why we often read in horticultural papers the question why standard Roses die. * * * * * *

The conclusion of these remarks is that all varieties of Roses are preferable when budded on the young seedling brier.

INSECTIVOROUS PLANTS.—Mr. Croucher tells the London Garden that trapped insects frequently injure the plants which they are supposed to "nourish." Here is his statement:—

"Any one who, like myself, has grown insectivorous plants continuously for some twenty years, knows that they are more injured than benefited by the insects entrapped, and that the idea that they produce more seed when fed with insects than when deprived of them is a fallacy. Some assume that it is granted that all plants have the power of absorbing nutritious substances through their leaf tissues. This is also a fallacy, though it has been accepted as proved by those who only study Nature to uphold theories. How is it that plants covered with glasses to keep off flies do so well? The great cause of much of the disputation on these subjects is that naturalists look at only one part of Nature, instead of studying her as one grand whole, seeing in the lower developments steps towards those that are higher."

CATALOGUES, ETC., RECEIVED.

THE thirty-second semi-annual statement of the Travelers' Insurance Company, which we publish on the last page of this issue, shows clearly its remarkably strong position. With total assets amounting to $4,955,090.43, its otal liabilities are only $3,659,539,46, leaving a surplus of $1,296,450.06 to meet all possible contingencies as regards policy-holders. An examination of the securities in which the funds of the Company are invested, shows that they are nearly all readily convertible into cash in case of any emergency. The statement also shows what must to the managers prove a very gratifying increase in the amount of business done by the Company during the past year, especially in the accident department, in which there is the remarkable gain of 11,422 policies over the number in 1878. With so excellent a record for the past, this Company can certainly, it seems to us, look forward to the new year and the new decade with a strong assurance of a continuance of the well merited success that has hitherto rewarded their discrimination and energy.

AMONG the first catalogues received for 1880 is that of the monster seed house of D. M. Ferry & Co., Detroit, Mich. It contains 180 well-filled pages, several colored plates, many engravings, all within the showiest of illuminated covers. It is filled with everything for the flower and vegetable garden and farm. Seeing nothing to the contrary, we are led to infer that it will be sent free of charge to applicants. It is certainly worth applying for and keeping as a handy and comprehensive reference book.

WEST TENNESSEE, its resources and advantages, by J. B. Killebrew, Commissioner of Agriculture, Statistics, Mines and Immigration for the State of Tennessee, a pamphlet of 93 pages. "Middle Tennessee," and "Tennessee, the Home for Intelligent Immigrants," by the same author. Published by Tavel, Eastman & Howell, of Nashville.

"SEED-TIME and Harvest." This is published by Mr. Isaac F. Tillinghast, of La Plume, Pa. It is a quarterly magazine of 24 pages, and the publisher is one fitted to make it of practical value by a long experience in the culture of flowers and vegetable seeds.

THE Wisconsin Dairymen's Association will hold its Eighth Annual Meeting at Elkhorn, Wis., Jan. 14 and 15. Among the premiums offered are two silver cups, valued at $25 each, presented by the RURAL NEW-YORKER for the best cheese and dairy butter.

PROGRAMME, Premium List, etc., of the Nebraska State Hort. Society, Winter Meeting, fruit and floral exhibit at Lincoln, on the third Tuesday in January. Robt. W. Furnas, President; Daniel H. Wheeler, Secretary.

Circular. Lectures on Topics Related to Agriculture, at the Ohio State University, in the city of Columbus, to continue three weeks. The lectures will be free. They will commence Jan. 13, 1880.

SALE CATALOGUE of imported and thoroughbred Holstein Cattle to be sold at auction on Wednesday, Feb. 4, 1880, on the farm of W. R. Willetts, Skaneateles Village, Onondaga Co., N. Y. Send for a copy.

REPORT of the Entomologist of the State of Illinois, on Noxious and Beneficial Insects. Prof. Cyrus Thomas, State Entomogist.

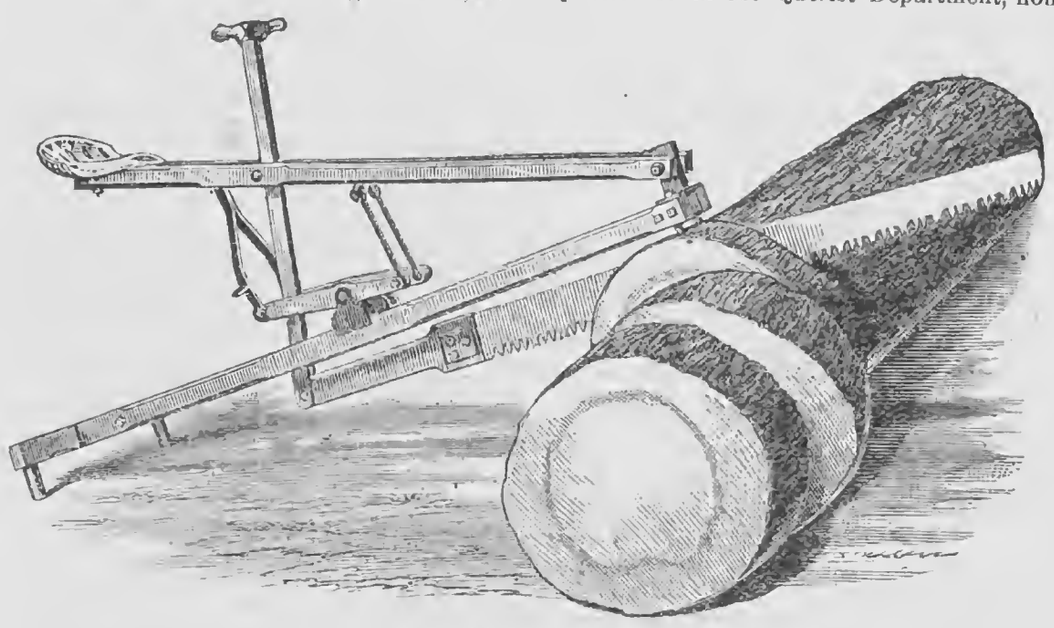
CATALOGUE of Trotting Stock, sold by Baker & Harrigan, Comstocks, Washington Co., N. Y.

THE Baltimore Sun Almanac for 1880.

Industrial Implements.

THE GIANT RIDING SAW.

WE have had several inquiries as to the efficiency of the riding saws advertised in the RURAL, and have answered the queries, either by letter or in the Querist Department, honestly, as we always do, to the best of our knowledge. Lately, however, we have especially investigated the claims of the Giant Riding Saws, manufactured by W. W. Bostwick & Co., 178 Elm Street, Cincinnati, Ohio, and find that the firm is quite trustworthy, and the saws made by them very efficient. By their use power is greatly economized, so that one man can, without much difficulty, pretty easily accomplish the labor of two working with the old-time cross-cut saw. Of them there are two sizes made, No. 1 and No. 2, the latter, six feet long and seventy-five pounds in weight, being especially adapted to agricultural needs, as is indicated by its name, "The Farmer's Friend." It is easily transportable from place to place, and is quickly brought into operation. The accompanying engraving plainly shows how it is operated. With one end upon the log to be cut and the other upon the ground, the operator having seated himself on the saddle, with his feet resting upon the foot levers, grasps the handle of the saw lever, and, as he throws his weight alternately from his seat to his feet, every "foot-pound" of power, resulting from the weight of the body and the muscular movement of the arms, is economically used to thrust the saw back and forth, thus bringing a powerful force to bear upon the saw in the log. By means of an adjustable seat, the machine can be readily adapted to persons of any size or weight, so as to be efficiently operated and maintain the same length of stroke. The firm informs us that they can turn out 100 machines a day, and that they fully warrant every one of them to do as represented. On the removal of the saw blade, the power that ordinarily drives the saw can, by proper attachments, be used for cutting feed, turning a grindstone, working a churn or corn-sheller, and for many other purposes, which so laboriously tax the strength and patience of those round the homestead. In a notice here we can only call attention to the merits of this device, and ask our readers who may be in need of such a machine, to seek more detailed information by dropping a postal card to the above address:



THE GIANT RIDING SAW.

GRINDING MILLS.

In the preparation of grain for food, the reduction of the berry to flour has always, except among savages, been the first, and generally, until recent times, the most laborious operation. Even to-day this work is lengthy and wearisome over a great part of the globe, not among savage races only, but also among the degenerate representatives of ancient civilization, and even in many of the rude sections of the most civilized nations. The quern, or hand-mill, with which the dusky women of Asia Minor to-day make the flour for cakes and other viands, differs but little, if at all, from that at which the daughters of Israel toiled in the days of David, and the women of Persia in the reign of Xerxes. But, while civilization has been stationary or retrogressive in the East, in the West it has been steadily advancing, slowly for centuries and rapidly for decades, in the art of grinding grain as well as in other useful and ornamental arts.

Recent improvements in milling are not confined merely to the substitution of steam, wind and water as motive powers in grinding, instead of human labor, but they also embrace the introduction of mill-stones much more efficient than those employed in ancient days. These are composed of a variety of quartz called burhstone, found in what is geologically called the Paris basin, and which is peculiar for its regular cellular structure and flint-like hardness. It is these qualities of extreme roughness derived from its honey-combed formation, and its capacity for holding a sharp surface, owing to its hardness, coupled with its great strength, that render it the best stone for grinding. Like cork, it is a natural product, and no efficient substitute for it has ever been discovered. The stones, when extracted from the quarries near Paris, are split with wedges into cylindrical forms: the pieces then are cut into parallelopipeds called *panes*, and these are hooped together in the shape of mill-stones, answering the purpose excellently well, while they are much more convenient for transportation than single stones. They are made into sizes to suit the largest merchant or custom flouring mill or the smallest farm mill to be driven by horse, wind, water or steam power.

Great care and experience are required to select this stone of the proper grinding texture and evenness for grain. The Nordyke and Marmon Co., Indianapolis, Ind., are manufacturers of complete grinding and bolting flour mills, and furnish them of two runs of stone and upwards—one for wheat and the other for corn. That represented in our engraving is capable of making, in 24 hours, 40 barrels of merchantable flour, and at the same time, of grinding 200 bushels of corn into meal. This outfit, with engine and boiler, can be purchased for $2,000, all ready to be put into any suitable house of one or two stories in hight. The stones are French buhr, simple in structure and easily managed.

It speaks well for the efficiency of these mills that there are over 1500 of them now in use, all of which, we are assured, are giving complete satisfaction. The firm should certainly by this time know how to satisfy the most captious customer, having been engaged in this specialty for 36 years.

Prices and circulars giving full information will be forwarded on application to the above address, and it would certainly be wise in those wanting mill-stones, bolting cloth, water-wheels, farm-mills, steam engines, flour-packers, or smut machines and bran dusters, to consult this firm before purchasing anywhere.

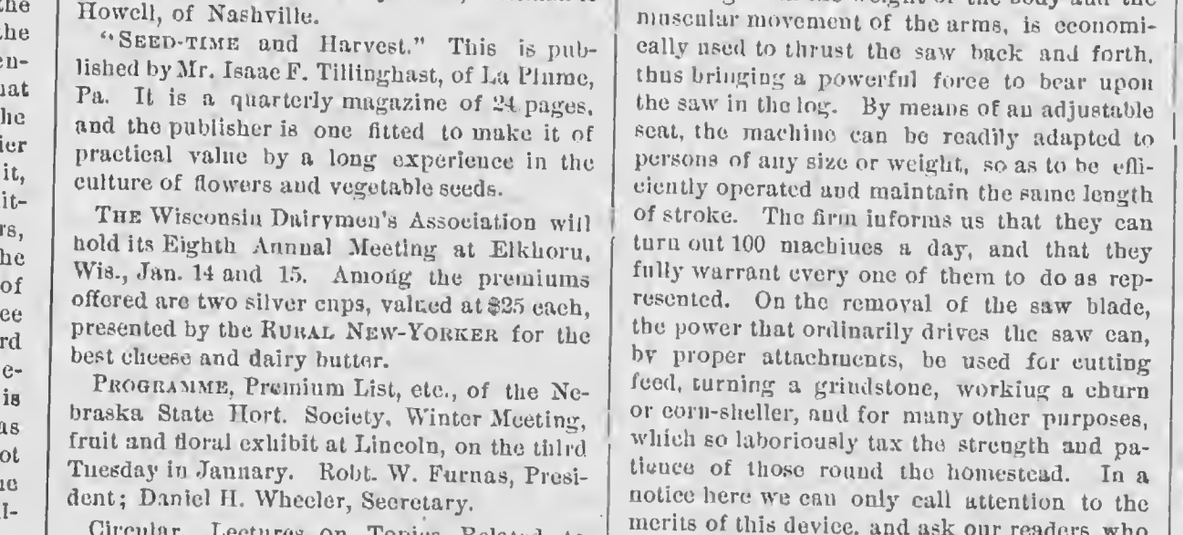


Fig. 2.

THE NORDYKE AND MARMON'S GRINDING MILLS.

Halladay Standard.

VICTORIOUS AT
Phila., 1876—Paris, 1878
25 Years in Use.
GUARANTEED SUPERIOR
To any other Windmill Made.
17 SIZES—1 MAN TO 45 HORSE POWER
Adopted by the leading R. R. Co.'s and by the U. S. Govt. at Forts and Garrisons.
$3,500,000 worth now in Use.
Send for Catalogue "B" and Price List.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

CONDUCTED BY

ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, JAN. 10. 1879.

As our readers are aware, for the past year or so we have made inquiries as to the benefit derived from the use of salt on Asparagus beds, so generally recommended. Thousands of acres of Asparagus are cultivated on Long Island, some with and some without salt. We have been unable to learn that salt is known to be of any advantage whatever. The most that is known seems to be that salt does no harm. It may be, however, that the air of Long Island, situated between the Sound and the Ocean, supplies all that is needed and that tests to ascertain the value of salt would have to be made further away from the influence of the sea.

SUBSCRIBERS will please remember that we are only too glad to supply them with free specimens of the RURAL NEW-YORKER at this time to show to their friends. Most people are glad to receive and to examine such specimens, as they are thus enabled the more discriminatingly to judge whether it is advisable to make any changes or not in their selection of journals for another year. We are naturally anxious to increase our circulation as much as possible, and any good words or kindly acts in our behalf on the part of our friends will place us under many obligations which we shall all the while endeavor to repay by making the RURAL more interesting and instructive.

MR. MARSHALL P. WILDER writes us that our pomological department keeps up abreast with the times and has afforded him much information, which is gratifying to us. By the way, the London Garden publishes our recent original portrait of this much respected gentleman, with a condensed biography of his life. Referring to this, to which we called his attention, Mr. Wilder says: "It is much better than the one in the Gardeners' Chronicle some years since."

There was a fine engraving of Mr. Wilder, we learn, published in Ghent some two or three years since in "D. Arboriculture &c." but the *title* was given as Le Maréchal P. Wilder as if he were a veritable Field-Marshal.

PROFESSOR C. V. RILEY sought the position of Entomologist to the Agricultural Department. He solicited the press to pronounce upon his fitness for that position. He was appointed and—resigned. Probably he was surprised that the resignation was promptly accepted, for he exerted his best influence to get back. Then he commenced and has since industriously continued his denunciations of the Department which, even if well founded, come from him, under such circumstances, with an exceedingly bad grace.

Professor Riley is generally acknowledged to be one of our ablest entomologists and it is to be regretted that he should suffer his ambition and his vanity to run away with his discretion.

CATALOGUES.

The Seedsmen's and Nurserymen's catalogues of the present day are proofs of the advancement which has been made in Agriculture and Horticulture, and records of wherein this advancement consists. Any farmer, florist or gardener who purchases his plants or seeds without having examined these works, does himself injustice. He cannot expect to keep up with the times. These catalogues are now issued by every prominent or enterprising establishment throughout the country, and most of them are sent to applicants either without any or for a merely nominal charge. Our advice to our readers is to send for all of them; to examine them carefully; to compare them and to make out their lists not until they have thus thoroughly informed themselves. The trustworthiness of the firm sending out the catalogue ought always to be considered before the price. Fresh seeds and well-grown plants have a standard value. When therefore we find certain kinds offered in one catalogue at a lower price than in the others, it would be judicious to learn something of the firm which so offers them before determining to send orders. Old or impure seeds or those not true to name; plants, whether for ornament or for fruit, that are not sound, well-grown and true to name, are always causes of very great disappointment. The new catalogues for 1880 from all of the prominent growers of this country and of England, will be noted in their appropriate place in our columns as they arrive. As before intimated, we urge our readers to consult them freely before making selections, even though they have but a single grape-vine, a half dozen strawberry plants or a pint of early peas to select.

NEVER SNUB A CHILD.

THAT was what our minister said in his sermon a few weeks ago, and if those four words made as much impression on the rest of his congregation as they did on us, that sermon will prove of more real practical value than most that are preached, and the children of generations yet unborn will have good reason to rise up and call the preacher blessed. We have no idea of giving a report of that sermon, or even a synopsis of it. What we have quoted is in itself a sufficient topic for consideration, and enough to furnish food for thought through one sitting.

"*Never snub a child.*" Mind that, you fathers and mothers who will read this! Think for a moment what is the effect a hasty, thoughtless word may make on the child's disposition. The little one may come to you when you are worn out by toil, tired from mental labor, engaged in reading or in conversation, or busied with some perplexing task, and trouble you with an innocent question. If you are vexed, don't show it; don't fret; don't look cross; don't speak hastily; answer the question as well as you can—some questions that children ask are not easily answered—and send the child away kindly. Its pleasant face will diffuse light and love over the whole house and do you a better service than you may be aware of. A frown, a rebuke, even the slightest check will show its effect on the child's countenance, and you may be sure it goes deeper than you can see, and lasts longer than you may think.

No opportunity to cultivate a child's self-respect should be neglected. That is the foundation of true manhood, and he who builds on any other builds on a quicksand. Better that than the education of the schools or fortunate business connections, high birth or influential friends. These are all well as adjuncts, but altogether they are less to be desired than that self-respect which begets confidence, energy and self-reliance.

If you want to try an experiment, take a dog and subject it for six months to the same treatment some children receive, and observe the effect. Our word for it, you will give it such a disposition that it will be known all over your neighborhood as an animal to be avoided. Somewhat like effects are produced on all other animals. There are, of course, differences. Some will be more easily affected than others, as their natural dispositions differ, but a harsh word is never without injury, and, if this is the case with animals whose appreciation of praise or blame must be comparatively small, what must be the result when a finely organized child is the subject?

Many brutal instincts may, in a measure, be overcome by kindness, and, on the contrary, humanity becomes dulled by undeserved reproof, even when it is not formulated in words. The world would be better if there were more kindly words, and many a child grows up to be a hard-hearted, unloving man who, if reared in an atmosphere of kindness, would have nourished the seeds of affection planted in his youthful days, and in his maturity been a blessing to all around him.

TWO QUESTIONS ANSWERED.—CONCLUSION.

LAST week we tried to show, in answer to our correspondent's question, that the ordinary *work* of the farmer will not be a "crucifixion" to the feelings and tastes of a farmer of education and refinement. The second part of his question, viz.: "Must he see an uneducated, boorish laborer at his table every day?" is, as we intimated, harder to answer. But we should, without hesitation, say No. The question, however, opens the whole subject of association with farm help, and how far it is necessary, and how far it need be degrading or distasteful to a farmer of culture. There are several solutions, as the question is vague. "A farm of 160 acres" may employ one hired man or twenty. We know a "farmer" in the "fruit belt" of Michigan, with much less than 160 acres, who, in bearing time, employs sometimes as many as *seventy* pickers, men, women and children. He does not board them. Even his regular hands do not board with him, but in a house near by. His only association is that of employer with employed. Of some of his employes he does not even know the names. They come from the country round about, find board, pick by the quart, get their tickets at the "shipping shanty," and he cashes these each Saturday evening.

We know other farmers with not more than 160 acres, who pursue some specialty, hire several hands, have a cottage where all dairy work, etc., is done and all the hands are boarded, so that the farmer associates with them only as he works with or oversees them in the field. And this cottage system is fast gaining favor even on moderate-sized farms in this country. It has long been the common way in other countries. It gives the farmer married help, and therefore usually more permanent and reliable, and less transient; takes the drudgery out of the family home or mansion, and settles the question of "eating with boorish laborers."

But our correspondent's question refers, we presume, to the more difficult case of a young farmer of refined tastes and good education but somewhat limited means, who pursues ordinary mixed or grain farming, and keeps only one or two hired men by the month. Now the only reason a farmer should board his help any more than the merchant his clerks, or the head carpenter or other mechanic his journeymen and apprentices, is that farm-houses, as a rule, are isolated and remote from town, and the farmer must in some way board his help or have none. Let this be granted then, and that this young farmer lives in a community where it is customary for the help to eat at the same table with the farmer and his wife and children, and where he will be called "stuck-up" if he departs from the usual custom, and that for this and other reasons he does not deem it best to depart from it. What then shall he do? One thing he can usually do, *choose* his help. A wide-awake, progressive, educated farmer can make his own choice among laborers. He need not have boors about him at all.

Plenty of young men—sons of neighbors, perhaps—knowing that they can *learn something worth while of farming* from such a man, will be glad to work for him a year or two before settling on farms of their own at the West. Now these young men may not be Chesterfields in manners. They may even see no objection to sitting at table in working boots and overalls, and shoveling food with a table-knife. But, if courteously treated, they will be willing, nay, even glad, to learn. If their employer courteously says, "I always remove my boots and work coat and overalls when I come in to meals or for the night, and put on slippers and a clean coat or dressing-gown, and I should like to have you do the same while you live with me. We may not notice the odor of the stable, having just come out of it, perhaps, but the ladies will be troubled by it." Ten to one the young man will readily fall in with the suggestion, and after a few weeks wonder he could ever have done otherwise. For this at least is not mere "stuck-up nonsense." It is utterly impossible for a man to milk a dozen cows, clean their stable, or "clean down" a span of horses as it should be done, without carrying more or less of the odor in his clothing and on his boots, no matter how carefully brushed or cleaned. And if he wears them all to table daily, he daily offends and insults at least the lady of the house, if she is a lady at all. We know many farmers' wives who bear this cross daily because they suppose it must be borne.

But what about further intercourse with hired help in the house? The various members of the house have their sleeping apartments, which should be sacred from all intrusion except on invitation. Then the large dining-room and the kitchen should be always warm in winter and be the home of the hired help and of such members of the family as choose to stay there for a longer or shorter time. But the evening home of the refined farmer and his family will be the parlor or library. Here he will read, and study, and write, and talk with his family and friends. Here will be the quiet games, the piano music and the singing. The rougher, noisier games will be in the dining-room. If the hired help have a taste and talent for music they will often be invited to listen to it or join in it. But it can easily be understood that they are expected in the parlor only when invited and only when suitably dressed.

Another question is in regard to the intercourse of the farmer with his men while at work. Need this be degrading to the farmer of refinement? Need it be a daily, hourly "crucifixion" to his tastes and feelings? Decidedly not. It will rather be a constant, gradual education to his men if they are the young men we have described. The stronger nature or intellect will always predominate. The educated farmer who really understands and loves his work—rather his *profession*—can constantly find in the work his men are helping him to do, subjects for conversation and instruction to the men. Profane or vile words and obscene stories will not be tolerated, no, not for a moment. They will be cast out as things low, coarse, disgusting, not to say immoral. The careful father will not risk his children even in occasional association with young men of vile or profane thoughts and tongues. He will not knowingly have such men on his farm, and he will take some pains to know about this matter.

And so the association of such a farmer with such men will not be a degradation and a crucifixion to him, but an elevation and a pleasure to them. They will not correct all their table manners in a day. But if they once know that by common consent the knife is used for cutting and the fork for conveying food, they will so use them. If they know that picking the teeth at table is an abomination, they will be more careful in that regard. And so on with the various gross violations of table propriety.

And if the farmer uniformly treats them while at work with courtesy and respect, they will treat him at least as well. They will say, "Yes, sir," and "No, sir," and "If you please," and, in short, use courteous language. And his intercourse with them need be no more distasteful than that of the merchant with his clerks, the doctor with his patients, the lawyer with his clients and witnesses, or of all three with their servants.

BREVITIES.

OUR next original portrait will be that of Professor Levi Stockbridge.

IT is a wonder that the Honeysuckle is not used for forcing more than it is. True, the flowers are not over showy, but their delightful perfume is reason enough.

A RARE LIST OF OFFICERS.—The Ohio State Agricultural Society for 1880 has Dr. J. A. Warder for President, N. Ohmer for Vice-President, M. B. Batcham for Secretary, and G. W. Campbell for Treasurer.

GOV. FURNAS of Nebraska "*has not had time to get rich.*" But he is rich in the sense of having commanded, by his life's acts, the respect and esteem of all who know him. Ah, that this sort of wealth were more alluring! Our portrait is from a recent photograph.

OUR friend Mr. W. Rice tells us that the report of the land department of the Union Pacific R. R. shows that 22,183.19 acres have been sold, the price amounting to $100,637 39. There have been 234 purchasers, so that the average price per acre is $4.53 and the average number of acres to each purchaser, 94.80.

To say that we are receiving up to date a larger list of subscribers than we have ever before received would be to say what is not true. We *may* say that we have to go back to 1874 to find a list as large as that we are receiving up to date. This seems to be due in a great measure to the *efforts of our own subscribers*. Thanks to them. May they live long and prosper!

DURING the present year this journal has been supplied with special reports of all important Agricultural and Horticultural Societies which have occurred in the North, West and South. New England, however, has been neglected. The present voluminous and extremely interesting report of the Connecticut Board of Agriculture will go far towards atoning therefor. It should be read by all.

WE know not how many inquiries we have received as to where the Southern Cow Pea, Doura, Duchess Grape, and other plants lately illustrated in our columns can be obtained. As to the Cow Pea, we are trying to place it in our seed-distribution. But if we do, only a small trial lot will be sent to each subscriber. As to Doura, we cannot at present say. Doubtless we can give the information before another planting season arises. As to Duchess Grape; we find that it is offered in our advertising columns.

ACCORDING to the estimate of the Encyclopædia Britannica, as estimated by a writer in the Nation, the natural resources of the United States, fully developed, are capable of sustaining a population of nearly 1,200,000,000, equal to the present estimated population of the globe. This estimate seems extravagant until we remember that even such a population would give us but three hundred and sixty-four persons to the arable square mile, while England to-day has about three hundred and eighty-nine.

WE must apologize. There is no getting around it. Our opinion about Roses isn't worth a snap. But we feel so humbled too. Oh! that we could take back what we have said about the American Banner Rose! "The ladies waiting on the tables at the great fair of the Seventh Regiment wore them." This is in every paper in the country. All these notices end: "As it can only be supplied in small quantities, it will cost more than its weight in gold!"—And the RURAL has spoken disrespectfully of this Rose!

Industrial Societies.

CONVENTION OF THE CONNECTICUT BOARD OF AGRICULTURE.

SPECIAL REPORT.

THE Annual Convention of the Connecticut Board of Agriculture met at Willimantic Dec. 17, 1879.

It was near 11 o'clock when Gov. Andrews called the meeting to order and introduced Ex-Governor Hyde, who delivered the introductory address. He congratulated the Board on the prosperous condition of the State and country. The cattle disease had no foothold on the soil, and science was liberating agriculture from the thraldom to which it had long been subject; it was doing more, it was elevating it. Old lands had been skinned and worn out; the old folks remained to die on them, and the young men had run away. Special rotation was not tried, if thought of. Soil had appetite, and needed food. It also had lungs to breathe. It needed drink also and, like the human family, it loves the sunshine, and smiles under good treatment. Our animals show the effect of better breeding. The dairy cow of to-day if not the queen of hearts was a power behind the throne. The ideal cow of the future will have a full udder, with a copious supply of milk, rich in cream for butter and caseine for cheese. Her depth of loin would please the eye and her flesh tickle the palate of the epicure. Had we reached this ideal yet? If not let us strive for it, remembering that "one star differeth from another star in glory." At the Dairy Fair at Greenfield he was amazed and deeply impressed at the immense product and interests involved in the Dairy business of the country.

R. S. Hinman read a paper discussing the right of the State to disseminate agricultural knowledge He had no question of the right, yet the impression prevailed to some extent that they had come together at the State's expense to advance their own peculiar interests. While this might be true in a limited sense, there was no just ground for supposing that any other interests were to suffer in consequence. The lands of England were entailed, and the Government directed the care and management of them. To make the case analogous, let Connecticut be the landlord and the farmer the tenant. It was to the interest of every merchant and manufacturer in the State that her agricultural interests be improved and her products increased.

Mr. Sedgewick opposed these views. Private means and enterprise had done much to benefit the farmer, and he thought them sufficient. If the State aided farmers with public money, why should it not aid merchants as well?

Governor Andrews stated the increase of property had been confined to one hundred towns; others had decreased. Of the twenty-six townships in Windham county only five showed any increase; the others show a decrease both in value and population. How can the producing capacity of a town that cannot support as much population as it did years ago, be increased so as to do it again? This problem seemed a proper subject for the Board of Agriculture to solve. A merchant from Boston or New York, who comes here with plenty of money made elsewhere, buys a farm, puts up fine buildings, etc., for a home in which to spend his surplus wealth was not the one to be benefited. It was the great mass of farmers who had only their farms from which to make their living.

W. P. Gates put the question differently:—How could the fertility of this country be prevented from going abroad in the way of grain, etc., exported? Would it not be better to bring the manufactories and operatives here where we could board them, and by consuming our surplus products at home, retain also the fertilizing materials that now go abroad?

Another speaker was surprised at Mr. Sedgewick's views; he thought the appropriations to the Board eminently proper and judicious; that people would differ as to the economy of their expenditure was to be expected, but he thought there was little ground for complaint on that score. There were farms in Connecticut, many of them, that could be bought for less than the improvements cost, and they were for sale; how to improve these farms and increase their products, were matters of interest to the whole community. He believed the export of beef, pork and grain added to our wealth; but the export of bone, linseed and cotton-seed meal, to fertilize the lands and feed the stock of foreign nations, was wrong. England sets us a good example in the use of these things.

Mr. Hinman asked if it were not to the press that Connecticut was largely indebted for the adoption of the Mapes's theory of plowing in manure, and to the Board of Agriculture was due the credit of exploding a system that had cost the State more thousands of dollars than the Board had hundreds.

Mr. Whitaker thought the course of the Executive in coming here to take part in this meeting was encouraging. Such conduct tended to the elevation and attraction of Agriculture. Last year butter at St. Albans sold at eight cents, cheese at 4 cents. Who could raise them at such prices? There was no sale for them here; they were sent to Europe and brought the gold that set the wheels of returning prosperity in motion. It was the patriotic sacrifices of American farmers on the altar of their country, that turned the tide of prosperity in our favor. Can the Board enable us to successfully compete with the West? It has been said that no other class had asked for State aid; but the manufacturing interests had been continually knocking at the doors of Congress for aid in the shape of a protective tariff. Some years ago he met in New York a gentleman who had expended large sums of money to secure this object, who assured him he thought it ought to be a penal offense to wear an article of foreign manufacture! These discussions consumed the morning hour.

Afternoon Session.

The first paper was by Secretary Gold on the preservation of food.

Temperature was of great importance; in addition, chemicals, sugar, salt, etc., were essential agents. Slowly ripened meat at a low temperature accounts for the superior quality of city beef over the country article. Veal and lamb need less ripening than beef. When fully ripe the meat should be put in hot water at once. Beef for ordinary purposes should not freeze; it would keep best in the quarter if allowed to hang for a week or more. Salting should be deferred until the meat is ripe. The fat of pork only should be salted, the lean should go for sausage. Pack pork in clean barrels on the edge. For curing hams he used six gallons of water, nine pounds of salt, two pounds of sugar, one quart of molasses, four ounces of saltpeter, two ounces of saleratus, for 100 pounds of meat. First cover with salt and let lie, flesh side up, for two days, then pack in barrels rather close and pour on the above brine For small hams three weeks will suffice; if large, six weeks. The latter he would take up and repack at the end of three weeks. At the end of the three or six weeks he takes them out, dries them thoroughly and smokes them without freezing. The preservation of grain and butter received due attention. The latter after working and salting to taste, was rolled in cloths, packed in barrels and covered with a saturated solution of salt. In reply to an inquiry from Mr. Fish, how to keep eggs fresh, he said: pack on end, cover with lime-water and some salt, and put in a cellar; they will keep for a long time.

Mr. Morrison asked if cellars differed in keeping butter.

Mr. Gold—"The temperature alone would make a difference."

Mr. Morrison could not keep his June butter in his cellar, but in a neighbor's it kept satisfactorily—a circumstance he could not account for.

Mr. Hart had put down two barrels in June; the brine, not being strong, had extracted the salt from the butter.

—"This was because the brine was not as salt as the butter; on the other hand, if it was more so, the butter would not absorb from it to any extent."

Mr. Augur's rule for salting butter was one ounce to the pound.

Mr. Hart—"This meets the taste of most people, while some wanted only an ounce of salt to 18 or 20 ounces of butter; cleanliness, good feeding, care in making, keeping in an even temperature and putting on the market at the proper time are essential to profit."

Mr. Cheever—"It should be kept *under* the brine, otherwise it will be apt to spoil; so with pork."

Mr. Wethercll—"Is salt essential to the keeping of butter? This question was asked at the Dairymen's Association a year or two ago and some one cried out he would like to have that question answered."

Mr. Hart did not think butter would keep without salt. Lard was mentioned in support of this theory, but the lard being cooked, they were not analogous. How should we compete with the West? The best hotels are supplied with butter from there, and it takes all the premiums and trade. He urged the cooperative system as the best means of meeting this competition; otherwise farmers must provide their wives with ice houses and other facilities.

Mr. Alpheus had noticed a great difference in quality of butter and concluded it was due to being hand-worked. In some suspected cases this was admitted.

Mr. Hinman said salt deepened the color of butter and was useful in extracting the buttermilk that the water failed to do, thus improving its keeping qualities.

Mr. White did not doubt good butter could be made without salt. His practice was to wash the butter two or three times, so that the last water ran off perfectly clear. Salt to suit the taste and it will keep a year. One can't make first-quality butter without good feed and clean and perfect manipulation. Cellars differ in keeping qualities.

Mr. Gold thought that under the best conditions the cream could all be obtained by the use of shallow pans; but perhaps some of the improved systems are superior to this. No doubt Connecticut farmers would expend $100.000 in dairy apparatus during the next five years. The Board were urged to conduct a series of elaborate experiments to ascertain the merits of the different methods. The gilt-edged butter of Dr. Grant and Mr. Starr were frequently quoted.

Mr. Day—"It is well known that these makers are surrounded with the best appliances; our farmers' wives would make gilt-edged butter, too, if so supplied."

To the question: When was the cream in best condition for churning? Mr Gold replied: "Just as it is ripe on the point of turning sour."

Mr. Hart agreed and would go a little further and say it was ripe just as it was sour, and if it could be kept at that point a few days, all the better.

Mr. Perkins compared the Grant and Starr dairies with the condition of Connecticut farmers generally, and claimed their profits were due more to the calves and stock sold at prices the latter could not command. He also wanted to know if it was a fact that the addition of an ounce of salt to a pound of butter did not increase its weight.

Mr. Hinman—If a reply must be based on his own positive knowledge he must waive it, but he believed it was a fact, on the assurance of the butter maker. The salt was worked into the butter at the first working and allowed to stand till the second working, its action being to eliminate the minute particles of buttermilk which the worker failed to do. In this view it was not difficult to believe the buttermilk thus obtained equaled at least the weight of salt added.

Mr. Whitaker's wife used three-quarters of an ounce of salt to the pound of butter, but she never sold as many pounds as she salted. As to hand-working butter, a man having three cows, his wife made the butter and took some to the Greenfield Fair and took all the prizes, and it was *hand-worked butter*.

Mr Augur—Gov. Andrews alluded to Colebrook's depleted farms this morning; he would add that butter making did not produce these effects. Our farmers want the best appliances, and he thought the Board would be justified in experimenting in this direction as had been suggested.

In response to inquiries Mr. Cheever said salt did color butter, and it would not keep without it. He agreed with Messrs. Gold and Hart as to the ripeness of cream, and in summer he used salt to keep it at that point. His price for years was 85 cents per pound; he now gets but 75 cents, owing to competition. A man in Boston commenced to make a specialty of gilt-edge butter a year or so ago; he began at 40 cents; it was in such demand that the price advanced to 50 cents, and, being satisfied with the profit at that figure, he declined to advance it further. The price of even gilt-edge butter, like other commodities, was subject to the law of supply and demand.

Mr. Sedgewick was informed in New York that the surplus of these fancy dairies was sold in that market for 30 to 40 cents.

Some discussion occurred in favor of an experimental farm and of testing improved dairy apparatus. Messrs. Gold and Augur thought these things could be accomplished without additional appropriations.

MORNING SESSION.

Dec. 18th.—The convention met at 9 o'clock. The Question Box was opened; the first ticket drawn requested Mr. Fish to give his experience in growing corn.

He thought he generally obtained the most bushels per acre from a large Dent variety. The stalks were large, grain white, cob red; did not know any special name for it, except Western Dent. He plowed sod as late as the middle of May. If the manure was coarse, he plowed it in; if fine, harrowed it in; plowed about six inches deep and harrowed thoroughly. Could not harrow too much. Used a Randall harrow, and if possible would harrow the whole depth of the plowed ground. Planted his corn in drills 3½ to four feet apart and dropped two kernels about every foot, and afterwards thinned to one. Did this to secure an even stand. As soon as it was up sufficiently, harrowed with a Thomas smoothing harrow till it was four inches high, then cultivated till it was about four feet. Thought his success was mainly due to his thorough and frequent harrowing and cultivating. Horse labor was cheaper than hand labor, and the latter must be avoided if we would successfully compete with the West. His first experience in harrowing corn was with a brush on potatoes, in crossing which he went over the end of a piece of corn adjoining. After doing so he repented, for he thought the corn was ruined; but it came out so well, the next year he ventured to put the harrow on, and any one as timid as he was, after making one trial, will not hesitate to repeat it. On a very stony piece of 6½ acres it took his boy half a day to go over after the harrow and remove any stones that happened on the hills. On one piece he applied 100 bushels of leached ashes from Canada to the acre, costing 17 cents per bushel at the railroad station, and harvested 120 bushels of corn.

One gentleman thought he made a mistake in plowing so late. To this Mr. Fish replied that possibly he had. He was at one time prejudiced in favor of fall plowing; but found his crop was more injured by cut worms. He once plowed in a heavy application of manure eight inches deep; he thought the manure would rot and be just where the crop wanted it; but it was a complete failure. He thought he had lost his crop and manure, too; the next season he turned the sod and manure up again and found it all there and only partially decayed. He planted to corn again and got the benefit of his manure in a heavy crop. He considered the corn and fodder to be one of the most valuable crops he could raise. By deferring plowing until late, the weather was warm and soon warmed the ground, and if the grass had made a good start, he thought it was green manuring in a small way.

How to Kill the Rose-bug was the next question.

Mr. Augur—"On a small scale hand-picking may be resorted to."

Mr. Hall had been deluged with them on a young strawberry bed and used Paris-green effectually. On fruiting beds this would not do, of course.

How to Relieve Choked Cattle? Mr. Fish stated that a stick of wood put in the mouth, like a bit, and fastened by each end to the horns was an effectual remedy for choking as well as hoven. The animal's efforts to get rid of the stick would soon give relief in either case. Mr. White had never found but one case where the obstruction could not be removed from the outside by the pressure of the hands.

The hour for the regular order having arrived, Dr. E. L. Sturtevant read a paper on Thoughts and Facts Concerning the Food of Man. Custom, habit, taste and prejudice were all shown to exert a vast influence over our palates. Soup, a permanent article of diet in France, in America was seldom used. The mushroom, in America almost unknown, in France, Belgium and Italy was almost a daily diet. The potato was cited as an instance of the difficulty of introducing a new article of food, as it was used in this country in the 16th century, whereas it took till the 18th century to get it into use in Europe. Flowers are in many instances used as food to a great extent, the chief instance in this country being the cauliflower. He had recently enumerated about 3000 varieties or species of edible plants and no doubt there were from 4000 to 5000. Of Cassava there are two species, the sweet and bitter; the former is perfectly harmless and little grown, and although the juice of the latter is intensely poisonous, yet the root is used for food and makes the cassava tarch largely used in some countries. Saw-dust is sometimes used as food; so are grasshoppers. An instance occurred in Massachusetts the past season of a school-boy whose play-mates had played tricks on him by holding him down and feeding him grasshoppers by force, which he afterwards learned to eat from choice.

Geo. Hyde called on Prof. Brewer to state what he knew about grasshopper diet.

The Professor stated that happening out among the Indians, he was tempted to try grasshopper pie, and it was not so bad. He gave the *modus operandi* of the Indians in making the 'hoppers up into what they called cachowda, which is really nutritious and delicious and much liked by the Indians. Prejudice affects our diet more than likes and dislikes. Pork was despised by millions. There is no good reason why horse flesh is not good, wholesome, nutritious and palatable. Time will overcome the prejudice against it.

Mr. Cheever related an instance of a man near Crawford Notch, N. H., a mechanic who it was reported ate live frogs. He sought him out, caught the frogs for him and saw him eat them.

Mr. Cressey—"Habits of diet are sometimes due to a morbid condition of the system."

Mr. Brewer—"Analysis shows that the clay so largely eaten by Indians and by people in some parts of the South, contains some ingredients that are palatable and nutritious. The crow, skunk and owl are mentioned by Mr. Capen as very palatable—the latter really delicious. Young crows are as good as squabs."

Mr. Webb—The hawk and raven are good; the buzzard and prairie dog passable.

After this repast the Question Box was applied to and asked that ubiquitous and never-to-be-settled question—What is the Best Strawberry?

The nearest approach to an answer was given by Mr. Capen, of Boston, that of the old, well-tested sorts for general use the Charles Downing would give as good general satisfaction on all occasions as any, and this view was generally concurred in. The Duncan was well spoken of; the Crescent, Monarch, Boyden, &c., were also mentioned.

Afternoon Session.

DEC. 18.—A paper on butter as an article of

food, by your excellent contributor, Richard Goodman, of Lenox, Mass., was read by Secretary Gold. A few points are noted:

"Gilt-edge butter is an article of recent manufacture, dating back about ten or twelve years. Philadelphia has the highest reputation for the best article. The Darlingtons had been preeminently successful, realizing from 95 cents to $1.25 per pound for their product. On the other hand, a case was mentioned where a lot of butter was sent in to compete for premiums, where not one-third of it was fit for use. Ireland might make good butter if the cattle were kept in decent quarters and care and cleanliness were used in its manufacture. The mass of the best butter of the future will be made by creameries under intelligent direction; but they will not be able to make what will be considered a gilt-edge article.

At this juncture a short stout gentleman came in wending his way to the stage and in a few minutes was introduced by secretary Gold as Prof. Collyer, chemist of the Dept. of Ag. at Washington, who would talk to the convention on sugar and sugar making.

The Professor stepped forward and said he should speak of sugar, its production and the waste of the country. The value of sugar annually imported was given at $109,000,000, which came out of the pockets of the consumers. We had imported since '48 $1,800,000,000 worth of sugar—as Col. Sellers used to say, "there is millions in it." The average consumption of sugar in this country is 35 to 40 pounds, for every man, woman and child, and it would be double were it not for the cost. The Department and its head had been sneered at and ridiculed frequently; he was not here to reply to any of these attacks but to give in plain, practical detail the results of some of his experiments from which he felt confident that in five years we should produce all the sugar we shall need for our own consumption, and in 10 years make it for export. His experiments were made with sorghum or Chinese sugar cane, and corn-stalks. There were about 10 distinct varieties of these sorghums, but in general composition there was no great variation. His experiments were with four varieties planted last May, and analyses made at different periods of growth, from the appearance of the flower to the hard freeze of Oct. 23rd, and once thereafter, showed that first the juice contained from four to six per cent of uncrystallizable and from two to six per cent of crystallizable sugar. In subsequent trials the uncrystallizable diminished to three, two, one, and in one case to less than one per ct., while the crystallizable increased to 17 per cent. He had made, in the aggregate, over 250 different experiments. He had sent to Louisiana for stalks of sugar-cane which were received in good order, and on testing them he had found they were not one whit better than sorghum. In 40 experiments, using 23 tons of sorghum and corn stalks, from the best nine of them he obtained 92 7-10 of the sugar in the juice. From nine of the poorest sirups he secured 90 and 1-10 of the sugar in the juice, and any one pursuing the same method could do the same. The apparatus necessary to work up the product of 25 acres, ought not to cost over $150; Aiken, of S. C., says $100. His brother-in-law in central N. Y. made sirup he sold at 50 cents per gallon. A gentleman in Ill. made 45,000 pounds of sugar which he sold at 10 cents per pound. His experiments yielded at the rate of over one ton per acre for any of the samples used, while Louisiana reported 1350 pounds per acre as the product from cane. He had secured 33 tons of stalks per acre; he would recommend only the early kinds of sorghum for trial in Connecticut. The most important thing was the time when the juice contains the largest per cent. of crystallizable sugar, which in his experiments he had found to be at its maximum at the ripening of the seed.

Of the sugar we consume we raise 13 per per cent. and import 87 per cent. We are paying as tribute to foreign countries for sugar more than the product of all the gold mines of the world, which it was said amounted last year to $100,000,000.

The aggregate corn crop of the country is 480,000,000 bushels; 1½ per cent. of the stalks would produce $109,000,000 worth of sugar. During the 15 years ending in '77, the average yield of corn had fallen off 20 per cent, and of wheat 16 7-10 per cent. The average at the East is greater than at the West both in wheat and corn. Dr. J. B. Lawes says that in England they have reached the utmost limit of profit. A larger yield would be unprofitable. England is importing $2,000,000 worth of fertilizers annually. The average mineral matter—ash—in 28 samples of corn is 1 61-100, consisting of phosphoric acid and potash. These come from the soil, and alone are worth 20 per cent. of the value, of the crop. A Baltimore man put up 75,000 cans of corn a day. Maine canned $1,500,000 worth last year. The stalks of these crops could be profitably utilized for sugar. He had tested them and they yielded sugar readily. At Bellerica a silo was recently opened and proved a success. After the stalks are pressed and the juice taken out, they are in better condition to go into a silo, and the sugar is saved. The white field corn with which he experimented, yielded 69 bushel of shelled corn per acre; after husking the corn the stalks were put through the mill and the per cent. of sugar was larger than he ever obtained from stalks before, as they yielded sugar at the rate of 1000 pounds per acre.

Evening Session.

The farmers had not finished questioning him at the hour of adjournment, and he consented to remain during the evening; the Convention meeting earlier than the usual hour, when he gave, in answer to questions, his methods of operating quite minutely, especially during the process of evaporating and crystallizing. With his rude apparatus he could evaporate 75 gallons of juice in three hours. For this latitude he would advise the Early Amber, or some other early variety, and get a good mill. He had no doubt anyone could succeed as well as he did; he only wondered so much had been done and so little accomplished. Doubtless previous failures had been due to the presence of a larger per cent. of uncrystallizable sugar. Let the cane mature and there need be no failure. No doubt five acres of sorghum could be grown as cheaply as one acre of beets, while the per cent. of sugar in the latter was only 12 46. The samples of sugar he exhibited were eagerly examined and tasted, and pronounced excellent.

The first paper of the evening was by A. H. Angur, a son of the Pomologist of the Board, on Fruits and Fruit Gardens for Farmers. He urged that more attention be given by farmers to secure a full and continuous family supply of fruits as promotive of health and happiness, and an inducement to the young folks to remain at home, and he gave lists of the best varieties as a guide to the inexperienced.

He was followed by J. M. Hubbard, with a paper on the Compensations of Agriculture. Though a farmer and the son of a farmer, he admitted that farmers, as a class, receive less compensation for their labor, financially, than do the followers of any other occupation. Still there were other compensations which he proceeded to enumerate:—First, work, hard work and plenty of it. A farmer need never be out of a job. There is a sure market for all his products, whether at a profitable rate or not. To the small capitalist it offers a safe investment. He surrounds himself and family with comforts, sound health, pure air to breathe, out-of-door life. Sunshine and wind, though sometimes rude, are, nevertheless, true friends; pure milk, fresh fruits and vegetables as ministers of pleasure and health, stand unrivaled and of inestimable value. It was a very interesting paper, and if he failed to convince his less sanguine hearers, who are prone to look at the shadows as well as the sunlight, that compensations were ample, all will agree that he presented a pleasing picture of rural life as it should be.

Morning Session.

Dec. 19th.—On assembling this a. m. at nine o'clock, Secretary Gold's prolific Question Box furnished ample material for discussion.

Will the cost of bringing the corn crop of the West to the seabord pay for the fertilizers necessary to produce the crop here? This was a broad question, to answer which required much research and statistics. It brought out, however, a statement from Mr. Perkins as to the value he placed on corn stalks for fodder. It took only 60 hours to cut the stalks from 130 bushels of corn. These, with an equal amount of cut hay, with the addition of meal, enables him to keep up the flow of milk from his cows equal to a grass diet.

A saturated solution of salt, followed by a dose of aloes, was Dr. Cressy's remedy for removing pin-worms from horses.

The Baldwin and Roxbury Russet were named as the most profitable long-keeping apples. Coe's Greening, origin Middletown, a firm, fine-grained, good-quality, productive, late-keeping apple, was named as promising well. It was one of the few perfect apples exhibited. Mr. Perkins thought the Roxbury Russet would fill the bill, in proof of which he showed fine specimens grown in '78, kept in his open cellar, sound and plump.

The question of the Best Strawberry for Market, elicited from Mr. Capen, the remark to which all agreed, that the Wilson had taken more money out of our markets than any one berry; but as a berry for all purposes he must say, as he said yesterday, that he thought the Chas. Downing the best of the well tried kinds. Mr. Wateman had made more money from Col. Cheeney than from any other; but it was a poor berry for table use. The Wilson rusted with him. The Monarch rusted less. The Crescent was not exempt. The Sharpless he thought the most promising of the new varieties.

Mr. Angur thought the Crescent rust-proof. It had proved so with him so far. He hoped The Sharpless would on trial prove to be all it promised. The Great American was generally a failure. [It may here be remarked that we have cautioned our readers against this much-talked-of berry from the beginning.—EDS.]

Mr. May—The point was the Wilson was unripe; if allowed to ripen, it would not carry better than any others.

Angur had been assured that a solution of copperas water was a sure remedy for the cracking of the pear. The curing of trips, the destruction of the white grub, pruning trees, etc., all received attention when the hour for the regular order arrived. Then Prof. Cressy lectured on Diseased Meat and its Consequences upon our Health and Happiness. All animals when slaughtered for food, should be in fair growing condition, not over-fat. As soon as an animal ceased to gain, its flesh began to deteriorate. He showed specimens of diseased meat from an animal recently slaughtered as first-class beef. This disease was called tychus tuberculosis, or consumption, and was more prevalent than was supposed, and spread by inoculation. It differed from pleuro-pneumonia.

All of these meetings have been largely attended, and much interest manifested among Ct. farmers, which must eventuate in much benefit to that class. The exhibition table contained 27 jars of apples and three of pears from Secretary Gold, of West Cornwall; 14 of apples and three of pears from Angur & Sons, of Middlefield; eight of pears from A. D. Capen, of Boston; eight of apples from C. T. Hickox, of Watertown. I. S. Hubbard, of Fredonia, N. Y., a plate of Prentiss's grapes; from Messrs. Hale, of So. Glastonbury, strawberries in bottles; Albert Day, of Brooklyn, four jars of potatoes; Mr. Williams, of Mystic, White Flint and Ga. flouring corn; J. B. Olcut, of So. Manchester, Tuscarora corn and meal; H. L. Stewart, of Middle Haddam, Waushakum corn—making altogether a very attractive display.

Literary Miscellany.

A QUIET HOUSE.

BY MARY AINGE DEVERS.

My house is quiet now, so still!
All day I hear the ticking clock,
The hours are numbered clear and shrill,
Outside the robins sing and trill,
The sunshine sleeps upon the sill,
My house is quiet now, so still!

But silence breaks my heart! I wait,
And waiting yearn for call or knock,
To hear the creaking of the gate,
And footsteps coming soon or late
To greet me sitting desolate,
The silence breaks my heart, I wait.

As through the lonely house I go,
From hall to hall, from room to room
What shall I seek to find or know?
The brooding shadows spread and grow,
The startling echoes mock me so,
As through the lonely house I go.

Ah! blessed Heaven, if I could hear
Sweet noises in the tranquil gloom,
Soft broken songs and laughter clear,
The joyous tumult, glad and near,
That vexed me many a happy year—
Ah! blessed Heaven, if I could hear.

Ah! blessed Heaven, if once, once more
My longing eyes might see the stain
Of little footprints on the floor,
And grouped like roses at the door
The sweet child-faces gone before,
Ah! blessed Heaven, but once, once more.

My house and home are very still!
I watch the sun, I watch the rain,
The winter days come white and chill,
And years go on....Perhaps death will
Life's broken promises fulfill
My house, my home, my heart are broken still!

CONQUERED.

CHAPTER I.

THE FIRST GLIMPSE OF THE FOE.

THEY were brother and sister; one could see that at a glance, although the slender figure of the girl was in such strong contrast to the almost Herculean proportions of the young man. They had the same crisp, wavy, dark-brown hair and broad, low brows; the same deep, gray eyes, well-rounded chins, and lips that parted readily into pleasant smiles. They had the same light, active movements, he accomodating his step to hers, and she alertly keeping close by his side, as if accustomed to take part in many a long, healthful country ramble; many a climb up cliff or mountain.

On this cold December afternoon this youthful pair were standing on the lawn in front of an old-fashioned, roomy mansion, built probably in the reign of Queen Anne, and secluded in its own grounds of three or four acres. It was situated in a picturesque district not far from the Sussex Downs, and an hour ago they had been exclaiming admiringly at the view to be obtained from a Belvedere in the garden. Now with upturned faces they were gravely contemplating the shuttered windows, smokeless chimneys, and barred doors of the house itself.

"It's a very grim habitation," said the young man, thrusting his hands into his pockets. "A week within its walls would teach a fellow to believe in ghosts, or else hunt the rats. Damp, deserted, gloomy, and unpleasant altogether.

"Those who used to live here, who trained those roses round the windows, didn't think so, George," said his sister, softly.

"Oh! if you're going in for sentiment, I've done—or, at least, I'll wait till the roses bloom before I give my opinion again."

"We ought not to have come here so late in the day," Katrine observed, slipping her arm through her brother's, with a little coaxing gesture which he never could resist. "If the sun shone, the empty house would not have such a depressing appearance."

"Oh!" said George, doubtfully.

"Really it wouldn't. With the gray, wintry sky darkening into twilight, and all so silent around, one naturally gets morbid."

"Hungry, if you like; it's hours and hours since I breakfasted; but I'll not confess to anything morbid but a dislike to being kept too long without my dinner."

"George," said the young girl, still keeping her eyes fixed on the house, "it is very sad that families should be disunited, and homes, such as this might have been, broken up for lack of a little kindly forbearance."

"It will be a great deal sadder to me," cried George, giving himself a little shake, and then squeezing his sister's arm to his side,—"a great deal sadder if you stand about here and catch cold. A pretty Christmas our first one in England for five years would be if you were *hors de combat!* And there are tears in your eyes, too! You silly Katrine! Hang our contrary relatives, I say, and all their disputes. Let those who quarrel fight it out amongst themselves, and we'll go in for peace and good-will."

Before Katrine could answer, he was running down the broad carriage drive at a rate that rendered her breathless by the time they reached the pretty but tenantless lodge at the gates.

"There's nothing like exercise for dispersing the blues," quoth George Wyllis, gaily. "Your roses are coming back, Kittens. But, I say, where's the trap? It was to have met us here precisely at four, and now it is ten minutes past."

"We shall meet it before long. I dare say," his sister replied, as she tripped beside him at a soberer pace."

"Humph! I should hope so; for it's beginning to snow, and it's an eight-mile drive into Arundel. The man could not have misunderstood the directions I gave him."

"He's a little late, that's all," said Katrine, placidly.

"All! It's very provoking; for you are tired, and not fit to buffet against such a storm of wind and snow as we shall be exposed to as soon as we reach the top of the hill."

"I am tired, I'll not deny it," the young girl murmured; "but it's no use being impatient. Perhaps your watch has gained a little."

"Anyhow, I must find you a shelter somewhere while I walk into the village," her brother exclaimed, with affectionate anxiety. "Do you know I am not sure whether I didn't tell the man he had better wait for us there?"

"A shelter!" repeated Katrine, peering about her. "But where are we to find one? Isn't there a cottage just beyond these trees? Ah! yes; I see it now. There was such a pleasant-looking, apple-faced old woman at the door when we passed it earlier in the day."

"Then you'll not mind going and warming yourself by her fire while I hurry to the inn where we lunched. If our vehicle is not there, perhaps I can charter another."

George Wyllis sprang away, and his sister, closing the umbrella the wind almost forced out of her hand, sped through the little rustic gate he had opened for her, ran up the path or the cottage-garden, and tapped at the door of her pleasant old woman's ivy-covered dwelling.

It was ajar, and her gentle "May I come in?" eliciting no reply, she stepped into the snug kitchen, and looked around for its mistress. A bright fire of wood and turf burned on the hearth, and the kettle, swung over it on a crane, was singing merrily; but the old woman had gone to the village-shop to replenish her stores; and with the happy security, found only in such primitive places, had left her door not merely unlocked, but open to all comers.

A very gaunt tabby, that was basking in the warmth, raised herself, and purred such a welcome as Katrine stood irresolute on the threshold, that she hesitated no longer. Brushing the snow off her ulster, she came and knelt on the rug to chafe her benumbed fingers, to take off her hat, carefully dry and curl the drooping feather twisted around it, and then shake down over her shoulders the curls of brown hair, in which the large flakes of snow were congealing together.

"Is your mistress a witch, pussy?" she merrily demanded, as she stroked the animal that was rubbing itself against her arm, "and did she disappear up the chimney on her broom-stick as soon as I came near? If she's mere mortal, she'll be rather astonished when she comes back and finds me so comfortably installed on her hearth-rug. What fun it would be to depart before she returns, and leave some tokens of my presence behind me! This blue scarf tied round your neck, tabby; half-a-crown in her comical little black teapot: another under the lid of her sugar-basin; why, she'd be sure to set it down to the fairies, or declare she'd had a visit from Santa Claus, if she has ever heard of him."

Katrine twisted up her hair, smiling at a queer reflection of herself in the highly-burnished top of a battered old pewter dish-cover that hung close by; and then springing to her feet began to drop her fairy gifts in quaint hiding-places. A couple of pieces of silver where she had at first proposed, another in the old woman's spectacle-case, and under the lid of a small work-box of Tunbridge-ware that stood on a side table, and this brought Katrine very near a half glass-door leading to an inner room.

The first time she had glanced in the direction of this sash a faded-green curtain hid what was behind it, but now chancing to turn her eyes that way she saw, or fancied she saw, a hand drawing the curtain aside.

For the first time since she entered the cottage Katrine realized her loneliness, and began to feel nervous; and though she walked quietly back to the fire-place, and talked aloud to the friendly cat

in the same gay, careless strain as before, her heart was beating faster, and she found herself wishing her brother would make his appearance.

There was certainly some one on the other side of the curtain, though why anybody should be hiding there it would be difficult to say. Yes, she was not mistaken; for while stooping, and pretending to caress the cat, she contrived to cast another look in that direction. The face of a man—a pale face, the lower part of it partially concealed by a beard and moustache—was pressed against the glass.

The moment she moved it vanished; but the fire-light had played upon it, and she knew that she was not deceived. Would the owner of this face, on having assured himself that she was alone, leap out upon her?

The supposition was such a horrifying one that she could scarcely restrain herself from screaming and rushing away. But she did conquer the impulse, and controlled her alarm sufficiently to walk to the door with the cat in her arms, as if merely proposing to ascertain the state of the weather.

Once there, however—oh! welcome sound!—the tramp of a horse's hoofs and the rattle of a vehicle rose above the sound of the north wind, and Katrine could be prudent no longer. Dropping poor puss into a snow-drift, away she ran, and did not stop till her brother's cheery "Halloo!" fell on her ear.—[To be continued.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

SNOW-BOUND COTTAGE.

BY J. G. WHITTIER.

A HARD, dull bitterness of cold
The coming of the snowstorm told.
Meanwhile we did our nightly chores,
Brought in the wood from out-of doors.

Shut in from all the world without,
We sat the clean-winged hearth about.

The house-dog, on his paws outspread,
Laid to the fire his drowsy head;
The cat's dark silhouette on the wall
A couchant tiger's seemed to fall;
And, for the winter's fireside meet,
Between the andirons' straddling feet
The mug of cider simmered slow,
The apples sputtered in a row,
And close at hand the basket stood
With nuts from brown October's woods.

Our father rode again his ride
On Memphremagog's wooded side;
Sat down again to moose and samp
In trapper's hut and Indian camp;

Our mother, while she turned the wheel
Or run the new-knit stocking heel,
Told how the Indian hordes came down
At midnight on Cocheco town;

Our uncle, innocent of books,
Was rich in lore of fields and brooks;

Next, the dear aunt, whose smile of cheer
And voice in dreams I see and hear,
The sweetest woman ever Fate,
Perverse, denied a household mate.

There, too, our elder sister plied
Her evening task the stand beside—
A full, rich nature, free to trust,
Truthful, and almost sternly just.

Upon the motley-braided mat
Our youngest and our dearest sat.

Brisk wielder of the birch and rule,
The master of the district school
Held at the fire his favored place;
Its warm glow lit a laughing face.

We heard once more the sleighbells sound,
The wise old doctor went his round,
Just pausing at our door to say,
In the brief autocratic way,
That some poor neighbor, sick abed,
At night our mother's aid would need.

And while, with care, our mother laid
The work aside, her steps she stayed
One moment, seeking to express
Her grateful sense of happiness
For food and shelter, warmth and health.
And love's contentment more than wealth.

LETTERS FROM A COUNTRY GIRL.—No. 20.

MARGARET B. HARVEY.

Young ladies who have "devoured" page after page and volume after volume of "yellow-covered literature," sooner or later wake up to the despairing conclusion that because they were not "born to wealth and high position," and because they don't live on "Fifth Avenue," they can never be anything,—that "refinement" and "good society" are things out of their reach. No matter whether or not they have lived all their lives in an atmosphere of comfort and intelligence and goodness—*their* folks don't live in *the* proper way. And they fret and writhe under this conclusion, and perhaps grow bitter and uncharitable, more or less, and wonder why it is that every spot in the United States, except a certain quarter of New York city, is given over to the "low and vulgar," and why farmers' and mechanics' daughters are considered by the "*ton*" as no better than "hired girls." If they are the least bit well-informed, and have read through the school histories, they wonder, too, if republicanism exists only in books.

My dear girls, I sympathize with you fully. Let me also try and help you a little. You have fallen into a very natural mistake, as a consequence of your reading—but let me tell you emphatically that it *is* a mistake. I need no better illustration than the present excitement in my own city, Philadelphia. General Grant is now our guest, and all delight to do him honor as have princes and kings, barbarians and enlightened. What man among us stands higher than does he? Yet we all know that he lived in a log house, that he learned his trade as a tanner, that he drank the very dregs of poverty. Suppose he had believed himself absolutely worthless because he wasn't born rich and didn't live on Fifth Avenue—where would our country have been to-day? He has made his own position, you say. So he has, and he deserves to be honored for it—but I contend that, aside from the usual improvement in every respectable human being as he or she grows older, he is no better now than he was in his days of adversity. He doesn't think so himself, at any rate, for he takes all his triumphs as modestly as any one well could. Not one in a thousand of you has before her as brilliant a future as our beloved commander of armies—but you may, if you will, have something worth striving for. I quote General Grant right here, because I think he fittingly personifies the genius of the American people.

You all have an idea of something which you variously express by the use of such terms as "position," "station," "high," "low," common," and so forth. Now, I say that unless as you grow older you grow also more and more sordid, and selfish and conceited and narrow, you will learn that what you mean ("caste," "social distinction," etc.) is a very arbitrary thing, representing totally different values in different localities, and, sifted down to the bottom, may be found "just nowhere." I once believed that "all men are created equal," although found in the Declaration of Independence, was not true—I believe differently now. I don't say that all men *remain* equal, but I do say that they are created so, starting life ignorant and helpless, all having within them the possibility of attaining supreme heights. Have we not all come short of the glory? What possessions have we, mental, moral or material, that we have not received as free gifts from our Creator—or, in other words, what are we ourselves? So, then, can you not see that republicanism is only another form of solid Bible doctrine, an inevitable following out of the true spirit of Christ? To rate men and women by mere externals is just about equivalent to rating them by the colors of their hair.

So, my girl, believe that you can be a true lady no matter how you are situated, and not only that you can be one, but that you can be known as one. But don't expect to be a perfect one all at once, any more than you can gain a thorough education all at once. Begin, first of all, to cultivate your heart and mind. This you may do in various ways—you may read good poetry, sing true songs, study impartial history, observe nature, in short, seek to love the good and the beautiful. If you are, or become a Christian, you have the most effectual help of all, for no woman, I think, can be in every respect a lady, unless she attend first to the discipline of her own heart, so as to develop an exceedingly sweet and tender charity for others. She should seek to be the personification of kindness, believing that *every one* has the same right to her civility. It will not do to be deferential to the rich and haughty to the poor—such conduct is worse than vulgar. Right living from within must, sooner or later, work outwardly to the proper regulation of every-day conduct. Still, it is well to think of externals a little—some attention to etiquette, too, will be of value. Yet, don't lay too much stress on it, else you will give rise to the suspicion that you only lately began to think of it at all. And don't ignore it entirely—you can scarcely do so without being betrayed into rudeness occasionally. But remember that while you are to make strict rules for yourself, you are not to do so for others—there is where you are to exercise your forbearance. We cannot ignore or snub people for what they do, or we would frequently offend those who have advanced far beyond ourselves. I have frequently seen one of the most influential and best-known writers in this country, sit down before me, and deliberately take out his knife and clean his nails. And I saw a prominent and gifted artist-whip out a comb in a crowded concert-room and smooth his rumpled hair. Rules are useful, but most people of character do insist upon being laws to themselves, though, I am happy to say, rarely to the extent indicated above.

You want good society, it is natural that you should, and right that you should have it. But, before you feel aggrieved that you are shut out (if you are, or think you are), pause, and consider whether *you* yourself are good society. Is your acquaintance worth making, on account of your admirable qualities, your courtesy, or your mental attainments? If not, then you have something to do in the way of fitting yourself for worthy companions. If so, why, then don't worry—water will find its level. Live simply, naturally, and intelligently, and you won't go through the world friendless.

Don't feel yourself in the least slighted because certain families in your neighborhood don't countenance you. Be strong enough to create your own circle—if you are not at present, look forward to the time when you shall be. You have a perfect right to invite whom you will into your house—so has your neighbor. You need not consider yourself any better or any worse than your fellow-beings—still, you don't want to "mix" with anybody and everybody, for two very good reasons. One is, some of your human brothers may have the capacity and the inclination to do you more harm than good. "Evil communications corrupt good manners." The other is, for the sake of upholding the privacy of the home. This is the principle upon which we do not sit at the table with our servants—not that we think ourselves so much superior, but that we do not care to have our domestic circle intruded upon. So, why should your "stiff" neighbors worry you? They may have nothing against you, and probably don't think of offending you—all they want to do, is to protect their family sanctity. You have precisely the same right that they have—when you know them better and they know you, you will find them delightful and the very reverse of "stuck-up"—or, if you don't, you needn't desire any further acquaintance with them. You will then have another illustration of the fact that externals are not all. You may as well learn, first as last, that those who *do* consider themselves the highest in the land, on account of money, or position, or influence, or anything else, and rely upon nothing in their own minds and hearts, are greatly piled by the united sentiments of the wisest, and would work you very little advantage if you did know them.

Tear yourself away from everything, and resolve to stand in your own integrity, though the heavens fall. Break off all degrading associations; eschew all vulgar habits of action, thought and feeling; turn aside from all frivolous pursuits. Read, study, and think. Beautify your home, so far as in you lies; learn to dress quietly and tastefully; treat your body as though you realized that it was a temple of the Holy Ghost. If you have friends living in cities—refined, cultured friends, I mean, there is more real vulgarity in cities than elsewhere, among what I may call the "half-cuts," people who are neither very intelligent, nor very ignorant—a few brief visits to them will teach you far more than I could in volumes, in the way of adornment, neatness, propriety, and so-forth, as well as give you an insight into general literature, music, art, science, and matters of interest generally.

Say that you have a better idea of true living. Don't become discontented with your circumstances, except so far as you desire to improve them. Cultivate a divine adaptability,—a heroic force that bends all things to its purposes, and overcomes unlimited discouragements. You never saw a place, however ugly and unattractive, that couldn't have been made better—even homelike and beautiful. As I think I showed you in my articles on Home Decoration that something may be made out of nothing—almost literally. A true, lady may make a ladylike abode out of "a hollow beech-tree." (That is, if such a thing exists; I never saw one.) Oh, if women would only do without carpets and buy pianos—without silk dresses and buy books, if they would have croquet and archery, instead of Hamburg edgings,—if they did without gold chains and bought photographs and hellotypes and engravings—how much sweeter and purer their lives would be. Their rooms would look far lovelier in simple matting and muslins, and they themselves far daintier in fresh prints and rough hats enwreathed with dried grasses, both rooms and dresses enlivened with natural flowers, than if houses and forms were loaded with gaudy finery, and minds and hearts left starving.

Having determined that your house—or your room—shall look like the abode of a lady, study all the more to act as it indicates that you do. Use your influence—gently, however—to bring those around you to do likewise. Remember a few little points, as preliminary to giving your attention to others:

"Airs" are always vulgar. You are what you are—affectations of any kind won't make you otherwise. Be yourself and act your usual character always. Be quiet and self-contained, and be very wary as to how you seek to impress your superiority on others. But then, here you may be misjudged. A genuine love of the refinements and proprieties of life, whether they are attainable at present or not, is the very opposite of "putting on,"—this last springs from a sense of inferiority and is a wrong means to overcome it—a cure applied, as it were, to the outside. Besides avoiding affectation, and smoothing off roughness, beware of gossip. No lady ever lowers herself so far as to tattle, or repeat what wasn't meant for her to know. Nor will she allow herself to say anything uncharitable of her neighbors—she is supposed to be busy with other matters. Talk about things, not persons—find subjects of conversation in books, and in nature. As to ebullitions of temper and sarcastic expressions—such things are worthy of heathens or, at most, ungovernable children. A lady who cannot control herself had better seek solitude immediately. It will save her friends, and the trouble of making countless apologies.

Of all ladylike accomplishments, the most valuable is the use of good English. Read well-written works and consult the dictionary frequently. Writing letters carefully is a good means of familiarizing one's self with spelling, punctuation and grammar. Speak well, if possible, whatever you don't do. In doing so, study to use proper terms—simple words are preferable always—eschewing slang and certain other words which have either gone out of use or never were recognized. Among these are "polite," "genteel," "pants," "gent," and some others. Never use words which savor of cringing servility on the one hand, or of haughty supercilliousness on the other, such as "big bug," "upper crust," and the like. If you wish to speak of a person's agreeable manner, say that he is "courteous" (pronounce it right, *curt-yus*), or mention his "courtesy." A worthy person is "respectable" or "refined," as the case may be. Put a little boy into "trousers," or "pantaloons;" even "breeches." Don't cut a *gentleman* down into a "vulgar fraction" of himself. Be especially careful of such expressions as "Law, me!" "Mercy, days!" "Hain't," "Hadn't orter," "It's me," "Thribble" (triple or treble), and "Slippy."

Don't appear at the table, especially in the evening, without being as neat as circumstances will allow. Don't eat with your knife. Such a practice is more than vulgar—it is barbarous—recalling the time when men used their knives to strip a dead animal, and cut off pieces of its raw flesh. The knife is to be used only to divide the food, the fork, held in the right hand, is to convey it to the mouth. The fork is *not* to be used in helping one's self to bread or cake; these are to be taken with the fingers. Never put your knife or fork into a dish upon the table from which others must be helped. Do not pour out tea or coffee into a saucer. Eat cheese with your fork. Do not hesitate at the last of anything in a dish; take it—there ought to be more. If you are at home, fold your napkin after eating. If you are out, unless you care to stay awhile, do not fold it, but leave it crumpled—it is supposed to be ready for the wash-tub. A few other little points you may find out for yourself from time to time. For instance, olives are to be taken with the fingers.

You know, of course, that you are not to pass before a person without apologizing; that you are not to pick your teeth or clean your nails in company; to neglect to answer a courteous letter or return a call; to present a sharp-pointed instrument with the point towards the person receiving it; to notice or allude to a deformity; to leave a caller abruptly, without asking to be excused; to speak of your own good fortune simply in contradistinction to your friend's adversity—that is, to boast, as the Southern girls did before the war, of "my father's wealth"; to make unkind or unnecessary remarks about acquaintances;—to forget yourself, in any way, without apologizing:—in a word, to be unmindful of the feelings of others. I went into detail upon matters which, I think, generally speaking, are most neglected among farmers' folks. In other respects, in good, hearty, old-fashioned hospitality, they are without peers.

A young lady *has* a right to select her gentlemen friends. Her house is *not* open to every Tom, Dick and Hary who chooses to come in. She may invite certain of her acquaintances to call and see her, and she may omit to invite certain others, to do the same. So far from a young man's feeling that he is free to visit or note any girl he chooses, he ought to feel honored that he is asked to visit any. And a young lady may or may not recognize any young gentleman who has been introduced to her,—he cannot speak until she has signified that he may,—that is, unless they have known each other long enough to be considered old friends. She can also excuse herself from an unwelcome visitor. There is no reason why a girl should not hold up her head.

A word or two as to children. The old system of repression is going out—the little ones are beginning to be treated as little ladies and gentlemen, and are taught to behave so. In old times, parents seemed to believe that children could bear any kind of boorish treatment, and still grow up with tender hearts and refined instincts—now, it is known that such a course of action tends to harden. So, never reprove a child in company,—if you have anything to say, say it afterwards, and privately. The old fashion of teaching children to say, "Yes, sir," and "No, ma'am," is going out—it is something that must be unlearned when they are older, for such a mode of speech in a grown person sounds servile. It is better to say: "Yes, mamma," "No, Mr. Smith," and the like, "Sir," and "Ma'am," being very sparingly used, chiefly in addressing a gentleman or a lady with whose name you are not familiar, or in case you desire to be exceedingly formal. If you wish a remark repeated, which you did not hear, don't use, "Sir?" or, "Ma'am?" as a question,—say, "I beg pardon." For children and older folks alike, the more simple, the more apparently sincere, the manners, the better—anything like elaborate bowings and scrapings, and the dancing-school style generally being considered rather in bad taste than otherwise.

A younger person is to be introduced *to* an older; a gentleman *to* a lady; in short, where there is an obvious difference between the two parties, the inferior to the superior,—otherwise, strike an equal balance as nearly as possible. Never, under any circumstances, directly *cut* an acquaintance,—if it would be unpleasant for you to meet such a one, you can avoid seeing him or her. And of all hateful things, I think a disposition to look out for slights and insults is the most so,—better not take in enough, than be always getting hurt,—the last argues a morbid self-consciousness that will finally ruin your peace of mind. Moreover, be very cautious about dictating to others,—even moderately advising,—for you may find yourself assuming a knowledge which you don't possess.

How far useful what I have said may be, I don't know. But I hope it may accomplish some little good. Don't cry down anything because it is "fashionable,"—all these considerations are proper and convenient as well. You are, or ought to be, as good as anybody,—as self-respecting, at least. So, nothing really valuable is too valuable for you if you will only take it and use it rightly. It is *your* duty, as well as other people's, to keep up with the times, and adorn your place in the world. See that you do it.

VARIETIES.

Your character cannot be essentially injured except by your own acts.

In memory's mellowed light we behold not the thorns, we see only the beautiful flowers.

To be comfortable and contented, spend less than you can earn—an art which few have learned.

None more impatiently suffer injuries than those who are always most forward in doing them.

The description of cuts, promised for the first issue in January, has been unavoidably delayed; it will appear in the next number.—EDS.

Pride is as loud a beggar as want, and a great deal saucier. When you have bought one fine thing, you must buy ten more, that your appearance may be all one piece; but it is easier to suppress the first desire than to satisfy all that follow it.

THE language of postage-stamps, instead of flowers, has been invented by a practical American. Thus, when a postage-stamp is placed upside down on the left corner of the letter, it means "I love you;" in the same crosswise, "My heart is another's;" straight up and down, "Good-bye, sweetheart, good-bye;" upside down in the right-hand corner, "Write no more;" in the center at the top, "Yes;" opposite at the bottom, "No;" on the right-hand corner at a right angle, "Do you love me?" in the left-hand corner, "I hate you;" top corner on the right, "I wish your friendship;" bottom corner on the left, "I seek your acquaintance;" on a line with the surname, "Accept my love;" the same upside down, "I am engaged;" at a right angle in the same place, "I long to see you;" in the middle at the right-hand edge "Write immediately."

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN-THOUGHTS FROM EVERY-DAY HOUSE.

MRS. ANNIE L. JACK.

I think the most unromantic time of the year in a farmer's kitchen is that period designated in some localities "slaughtering time." Then half the men of the neighborhood collect at some place of rendezvous, generally near the principal store of the village, or on the premises of some one famed for fat pigs. The work is done with a coolness and evident relish that are surprising and the chief conversation for days afterwards is of the weight, size and fleshiness of the defunct animals. To the housewife it is a busy time and entails a large amount of prosy and extra work that I cannot begin to recount. But one important item we have been lately preparing, and knowing my own difficulties in times past, I give one method for the use of young housekeepers, or those who have no better plan. It is

Brawn, or Potted Head.

Soak the heads in salt-and-water twenty-four hours, changing the water and turning them once in that time. Then place in clean water in which is dissolved a tablespoonful of saltpeter and enough salt to make a weak brine, after two days they will be found clean and ready to prepare. Then with a sharp knife thoroughly clean each piece, rinse and boil until the bones slip out. Do this from the back and under-side of the head. The feet and ears, I should mention, should be put on first, as they require half an hour or more extra boiling. A beef tongue to each head is an improvement; it is also better to omit the fatty part of the cheek; season with black pepper, powdered sage, salt, mace and cloves to taste. A little cayenne adds to the flavor for those liking high seasoning. Wet your molds or dishes with cold water, and pour in the compound while hot, taking care to have every small bone removed. This, when kept cold and only turned out of the molds when wanted, is a nice relish for breakfast or tea, and keeps fresh a long time. The chopping machines have made the making of sausage meat easy, and there is quite a difference between now and the time when we tired our wrists and wearied our patience with the wooden bowl and mincing knife. So much for the march of improvement which is comparatively slow in the housekeeper's department compared with the rest of the world's work.

AMENITIES OF RURAL LIFE.

I WAS interested in reading Mrs. Annie L. Jack's remarks in a late RURAL. I agree with her that contact and intercourse with the domestic life of other families than your own, are healthful in their effects on any housekeeper who, perhaps, has often been tempted to think her experience in life a little more complicated and irksome than that of others could be. The dull routine of domestic life becomes tiresome and burdensome without a change which is so invigorating to mind as well as body. What is pleasanter than an interchange of visits among those who can enter into our needs and sympathise with our trials! Sympathy is a great panacea and heals many a wound which might otherwise cause sad results. We are none of us so poor and lowly but that we can find plenty who will understand our trials and be ready with words of comfort. Don't, therefore, shut yourselves in day after day and year after year without an endeavor to cultivate the amenities of life, for in so doing you do yourself, your husband and your children an injustice, for they will certainly lose much by such a course. Set apart certain times or days as sacredly for the cultivation of social intercourse, and enter into it as religiously as you do the care of your home, thus opening the way for improvement not only for yourselves but for your neighbors and friends. M. H. S.

DOMESTIC RECIPES.

Graham Gems.

Stir Graham flour in sweet milk to the consistency of griddle cake batter; add one egg well beaten and a little salt. Bake in hot gem pans.

M. M. WASHBURN.

Indian Pudding.

Eight tablespoonsful of corn meal; one-half cup of sugar; one-half cup of molasses; one-half teaspoonful of cinnamon; one-half teaspoonful of allspice; one-half nutmeg and a piece of butter the size of an egg. Stir these well together and add milk well moistened. Have the milk boiling and stir all well together and bake one hour and fifteen minutes. I think you will not find this the oft despised Indian pudding. A. G.

QUESTIONS ANSWERED.

Drying and Canning Pumpkins.

Mrs. W. S. M. asks how to dry pumpkins for winter use.

ANS.—Take the ripe pumpkins, pare, cut into small pieces, and steam until tender. Mash, strain through a colander and spread on greased pie plates not quite an inch thick. Dry in an oven as quickly as possible without scorching. When partly dried turn over. Keep as you would any other dried fruit. When wanted for use, soak the pieces over night in a little milk and they will return to a nice pulp. The following recipe for preserving pumpkins in cans is an excellent one, and may give better satisfaction than drying. Steam and put through a colander the same as in drying. Fill glass cans with the pulp and place over the fire in cold water. Boil an hour or longer. Remove from the fire and seal air-tight.

Keeping Sausage.

Mrs. S. H. Green asks how to keep sausages through warm weather.

ANS.—Make up into little cakes as for table; fry until about half done; pack them into gallon stone jars and pour melted lard over the top. When wanted for use, scrape off the lard, take out what is required, and always be particular to melt the lard and return it *immediately* to the jar. Or, the sausages may be stuffed in skins, partially cooked, and packed in jars, same as above. The jars may be sealed in either case with pieces of brown paper smeared with flour paste. Keep in a cool, dry place.

To Restore Graining.

Miss M. E. Sanford asks how to restore the graining of a room which is badly cracked by the use of hot water in cleaning.

ANS.—So far as we know nothing will restore it, but perhaps some of our readers can offer suggestions.

Salsify or Vegetable Oysters.

W. A. Marean asks for recipes for the above.

ANS.—*To stew:* wash thoroughly, scrape off the skin with a knife, cut across in thin slices and boil in water only enough to cover, until tender. Add a cup of rich milk or thin cream, thicken with flour and butter rubbed together, season with pepper and salt. Toast some thin slices of bread, place in the tureen and pour over the oysters. The thickening may be omitted, more milk added and served with crackers like oyster soup.

To Fry: Scrape, parboil, cut into slices, dip into a beaten egg then in cracker crumbs and fry until well browned.

Fritters No. 1: Scrape, boil until tender, mash fine, wet to a paste with a beaten egg, a little milk butter and flour for each cup of salsify. Season, make into little cakes and fry until brown.

No. 2: Three beaten eggs, one-half cup of milk, half a dozen small roots of salsify, flour for a thin batter, salt and pepper. Grate the roots into the batter made of the eggs, milk and flour. Drop by the spoonful into boiling fat.

News of the Week.

AGRICULTURAL NEWS.

Crops.

WHEAT.—The December crop report of the Dep. of Agriculture states that preliminary investigation points to an increase of twelve per cent in the area sown in winter wheat. The only States reporting a decline are Alabama, Mississippi and Arkansas, in which the united wheat area would not exceed that of some counties of the Northwest. All the other States show an increase, especially the spring wheat States of the Northwest. The winter wheat acreage of these States, however, is small, and hence their increase. Even a very high ratio does not add materially to the breadth sown in the country. But many large winter wheat States report great enlargement:—New York, West Virginia, Ohio and Michigan, each 7 per cent; Texas and Tennessee, each 10 per cent; Kentucky and Indiana, each 14 per cent; Missouri, 16 per cent; Kansas and Oregon, each 20 per cent; Illinois, 22 per cent. There are quite general complaints of the ravages of the Hessian fly in the early-sown crops, and of the drought hindering germination in the late-sown. Yet the crop starts out on the whole under prospects considerably above the average, especially in the large winter-wheat States.

TOBACCO.—The final returns have not yet sensibly changed the November estimates of the tobacco crop. The total product of the country is within a small percentage of that of 1878, the gain being chiefly in Kentucky, Tennessee and Connecticut, and the most serious loss in Ohio and Missouri. As a whole, the quality is but slightly better than that of last year's crop, although the improvement is quite marked in several States. The total crop of 1879 is estimated at 384,059,659 pounds, valued at $21,545,691, against 392,546,700 pounds, valued at $22,127,428 in 1878.

OATS.—The return of the oat crop made on November 1, is confirmed by the report of this month. The total product of the country is estimated at 364,253,000 bushels for this year, against a total in 1878 of 413,578,000 bushels—a decline of 12 pr cent. The price as returned on the first of this month averaged 33.2 cents per bushel, against 24.6 cents last year at the time, making a total valuation this year of $120,855,000, against $101,845,000 in 1878.

POTATOES.—There is no change in the estimate of the potato crop of the last month. With an increase of three per cent. in the acreage for this year, there is a yield of 98 bushels per acre, against 69 bushels last year and 94 bushels in 1877. The total crop for the country is estimated at 181,369,000 bushels, which at the price returned—43.5 cents as the average—would make in round numbers $79,000,000, against a valuation last year of $73,050,000.

WINTER RYE.—The area in winter rye has fallen off about three per cent. from last year. The New England States, the States north of the Ohio River and the Pacific States equal or slightly increase their last year's acreage. Texas, the only one of the Gulf States in which this crop is of sufficient importance to attact attention, reports an increase of 19 per cent. The other sections report a diminished breadth. The falling off in the Southern inland States is fully one-fifth. The condition of the crop is about average on the whole, being above in a majority of States reporting it.

HAY.—The hay crop is about 10 per cent. less than that of 1878. The New England and Gulf States have slighly increased their product, but all other sections have declined. The heaviest loss is in the Southern inland States which taken together have fallen off 27 per cent. The drought in this section has fallen with especial severity upon the grass crop. The same disastrous influence has been felt in the States north of the Ohio, where the loss is 20 ner cent., and in the South Atlantic States, where it amounts to 17 per cent. The Middle States, the largest hay-producing region of the country, fall off nine per cent.; in the remaining sections the losses have been much less, the Pacific States falling off but one per cent. The average price of hay is about $9.24 per ton, against $7.21 in 1878. The aggregate value will be over $325,000,000 against $285,543,752 last year, an increase of nearly 14 per cent.

An elevator with a capacity of a million bushels will be built at Duluth next spring. . . The new grain elevator now building at Jersey City will be the largest in the world. The Erie Company is also building a monster elevator at Jersey City. . . . America contains 13,000,000 milch cows; Germany, 9,000,000; France, 5,000,000; Great Britain and Ireland, 4,000,000; and Switzerland, 600,000. In 1870 there were manufactured in this country 960,000,000 pounds of butter and 340,000,000 pounds of cheese. About 4 per cent. of the former and over 40 per cent. of the latter were sold for export. . . Short-horns in England have sold on an average fully $52 each lower in 1879 than in 1878. In the past year the average price of 2,354 animals was £47 19s. 9d., while the average price of 2,811 animals the year before was £57 5s. 9d. . . The total exports of produce from this port since Jan. 1 '79 were $353,237,730 against $346,916,873 for the corresponding period last year, and $298,620,928 in 1878. A very fair increase.

The Western N. Y. Hort. Society will hold its 25th annual meeting in Rochester, in the Common Council Chamber, commencing Wednesday Jan. 28th. 1880 at 11 A. M. Prof. G. C. Caldwell, Professor of Chemistry, Cornell University; Prof. W. R. Lazenby, Professor of Horticulture, Cornell University; Hon. Lewis F. Allen, Buffalo, N. Y. An early member of the Society, and one of the most eminent Agriculturists and fruit growers of our State; Mr. John J. Thomas, Editor of the Country Gentleman, and author of "American Fruit Culturist;" Mr. James Vick, the renowned seedsman and florist of Rochester; Mr. H. E. Hooker, Esq., of Rochester, a vice-president of the Society, and a cultivator of great experience; Prof. C. H. Dann, of Warsaw, N. Y. Mr. J. S. Woodward, of Lockport, a vice-president of the Society, and a practical, successful orchardist; Mr. H. B. Ellwanger, of Rochester, whose papers on the Rose have been so acceptable, will each make an address at this meeting. After the reading of each paper, there will be discussion on the topics suggested by it. Full reports are expected from the Standing Committee, ten in number, and also from the Special Committees on Orchards. A great variety of questions have already been proposed for discussion. When all have been received a complete list will be prepared and sent to members. Farmers' club and all kindred societies are invited to send delegates and ladies are especially invited. Specimens of new and rare fruits, or such as possess some special interest, also other rare garden products, new implements, etc., are solicited. Parties who may not be able to attend can have the transactions mailed to them by remitting the annual fee of membership, one dollar to Mr. P. C. Reynolds, Rochester, Treasurer. . . Pleuro-pneumonia is reported to be spreading in Westchester Co., N. Y. . . Great floods occurred in the Canary Islands in Dec. 21st. Houses and crops destroyed. . . The Chicago Board of Trade has protested against the adoption of the central system here. The grain operatives are still bitterly opposed to it. In any event it will take years before *producers* can get accustomed to it . . St Louis grain receipts for the year 1879 were 45,000,000 bushels, an increase of 10,000,000. Cotton receipts largely increased, and all leading lines of business showed a marked improvemeet. . . Cincinnati grain receipts for the year 1879 wore the largest in the history of the city, being 11,263,275 bushels, against 11,165,697 bushels for the previous year. The total value of all merchandise receipts was over $208,000,000 and of shipments over $192,000,000. . . Much dissatisfaction is expressed by the farmers who supply Philadelphia and this city with milk, at the prices they are getting for their product, and an agitation is now under way on the subject of devising some means for forcing dealers to pay a higher figure.

MISCELLANEOUS.

Monday, January 5, 1880.

A political event has occurred in Maine which is calculated tocreate widespread alarm. A republican majority of seven in the Senate and twenty-nine in the House of Representatives of that State has been counted out by the Governor and council, who act as canvassers of returns of votes cast; and a democratic and greenback majority of eight in the Senate and seventeen in the House has been counted in. If this action is consumated by the organization of the two houses of the Legislature as thus constituted by the canvassing board, a greenback Governor and State officers will then be elected. The republicans have of course done all in their power to reverse this action of the Governor and council, and attempted to bring the matter before the Supreme Court, but the court held the opinion that it could not interfere with the Executive Department. At last accounts some of the democrats to whom the Governor had granted certificates of election refused to occupy the contested seats in the Legislature.

The energetic French engineer M. de Lesseps is now in the field with a large staff of assistants making the final survey for the projected canal across the isthmus of Panama which shall separate North America from South America and unite the Pacific with the Atlantic Ocean. Indeed, it is not yet known whether it is practicable or even possible to construct the canal at all, but this question M. de Lesseps is expected to decide at the end of this month. A conflagration took place on the evening of New Year's day at Red Bank New Jersey, which destroyed the business block of the town. A number of buildings were destroyed but it being mostly plain frame structures the aggregate loss is not so large as it might have been. The total loss is estimated at $35,000.

A double lynching took place at Golden Colorado on December 28th. Two men, Sam Woodruff and Joe Seminole, committed a cold-blooded and cowardly murder on a farmer, R. B. Haywood, last September. They were both arrested and were awaiting trial when they were taken from the jail by 150 masked men and lynched. The severest weather reported for years prevailed in Dakota Minn., and Northern Wisconsin at the close of the old year. The cold wave seemed to come from the British Possessions. At St Vincent the thermometer stood 50° below zero, at Crookston 56°.

FOREIGN.

Although prices of food are unusually low in the British Isles, yet the pressure of extreme want is upon thousands in Great Britain, and that of starvation upon tens of thousands in Ireland. Earnest appeals for relief are made to the public on this side of the Atlantic and on the other; but succor is slow and people are actually starving in the west of Ireland. . . The French have a new Cabinet under the presidency of De Freycnet, whose program is very radical. He intends to enforce a purification of the civil service, by turning out every official who does not emphatically endorse the Republic, suspending established laws to effect this purpose. . . Canada has lately been somewhat reorganizing her Cabinet. She has now thirteen ministers to 5,000,000 population, while we with 50,000,000 manage to get along with seven. . The King and Queen of Spain were fired at as they were driving through the palace gate at Madrid, the other evening. The would-be assassin was immediately arrested, and has confessed his crime. . . King Humbert of Italy, has been shot at while out hunting, recently, by a gang of poachers. . . A portion of the bridge across the Firth of Tay, on the east coast of Scotland, was blown down the other night while a train from Edinburg to Dundee was crossing, plunging the cars into deep water and drowning about 75 passengers. The bridge opened to traffic in May, 1878, was 10,320 feet, about two miles long, being the longest iron bridge in the world, and it had 89 spans. It cost $2,545,000 and was 130 feet above high water.

The Proof of the Pudding is in the Eating.

Grocerymen and storekeepers pay 3 to 5 cents a pound extra for butter made with Gilt-Edge Butter-Maker. It increases production 6 to 10 per cent.; reduces labor of churning one-half; gives a rich golden color the year round. Sold by druggists, grocers and general storekeepers. Send stamp for "Hints to Butter-Makers." Address, Butter Improvement Co., Buffalo, N. Y.

FOR ALLAYING HOARSENESS and Irritation of the Throat it is daily proved that "*Brown's Bronchial Troches*" are a mild remedy yet very efficacious.

Truth is mighty and has prevailed. See its triumph in Hop Bitters.

The Markets.

THE GIST OF THE MARKETS.

WHAT was said here last week about the state of trade in agricultural products, in various parts of the country, may be repeated this week—things are nearly at a standstill, and will probably remain so far a week or two at least. The prices of our surplus cereals depend on the necessities of our transatlantic customers, and these seem determined not to pay our figures until forced to do so by the cry for food from their suffering countrymen. Well, we can afford to wait, and that seems the present intention of the dealers and speculators here. The prices still offered by these for grain for future delivery, show plainly that they expect a further rise, and generally as a class they have pretty correct information about the amount of grain that can be supplied to our foreign markets from other sources, and therefore can estimate pretty accurately the prices at which we can afford to hold our produce. Just at present, however, the general tendency of prices for cereals throughout the country, is downward.

The produce dealers are joining the grain men in their opposition to the Cental system in this market, and another petition was presented to the Board of Managers of the Produce Exchange on Saturday 3d inst., asking that another ballot should be cast to decide whether it should go into operation or not. This is important to farmers, as upon the action taken will most likely depend whether they will soon have to sell their produce by the old-fashioned bushel or the new-fangled Cental. As yet, despite the last vote here, the selling price of grain is still posted up in the Exchange in bushels.

It will be seen that we have enlarged the scope of our market reports at several points this week, notably at Boston, Chicago and Louisville, in compliance with the wishes of our friends in districts tributary to those points. For the sake of condensation as well as of intelligibility, we arrange all the quotations in each market together, so that anyone interested in any item can readily discover it in CAPITAL LETTERS, on casting his eye over the proper report.

The following were the net receipts of cotton at the below named ports from September 1, 1879, to Jan. 1st, 1880:

Ports.	Bales.	Ports.	Bales.
Galveston	339,036	Boston	125,306
New Orleans	833,626	Providence	20,076
Mobile	247,329	Philadelphia	16,281
Savannah	547,860	City and West Point	138,227
Charleston	343,589	Brunswick	3,156
Wilmington	65,863	Port Royal	20,757
Norfolk	373,329	Pensacola	405
Baltimore	9,854	Indianola	6,354
New York	88,521		
Total			3,183,569

SPECIALS FROM ALL CENTERS.

Until Saturday, Jan. 3.

Baltimore.—Since last report No. 2 West'n winter red wheat has fallen ½c. on spot and a shade more on futures; other grades unchanged. Southern white corn is from ½c. to 3c lower; do. yellow, a shade lower; Western mixed is from 2¼c. to 2½c.

lower. Oats 1c. lower on all grades. Rye and hay and butter unchanged. Eggs, 1c. lower. Cotton, middling, 1-16c. higher, other grades unchanged.

WHEAT.—Southern red, $1.40@$1.45; do. amber, $1.50@$1.65; No. Western winter red, spot and Jan., $1.52@$1.52½; Feb. $1.56½@$1.56¾; March $1.60@$1.60¾. CORN.—Southern lower owing to large receipts; Southern white, 60c.@62c.; do. yellow, 58c.@59c.; Western mixed, spot and Jan. 57¼@57¾. OATS.—Southern and Western white at 46c.@47c.; do. mixed 45c.@46c.; Penn. 46c.@47c. RYE.—$1. HAY.—Prime to choice Penn. and Md. $17@$18. BUTTER.—Prime to choice Western packed, 22c.@28c.; roll 20c.@24c. EGGS.—Fresh 20c.@21c.; limed, 15c.@16c. COTTON.—Middling, 12 9-16c.; low middling, 12¼c.; good ordinary, 12c. Weekly receipts, 8,255 bales; gross exports, 3,376; sales, 1,400; spinners, 235.

Boston,—Corn is about the same as at last report; oats somewhat higher; rye unchanged; shorts $1 and middlings from $1 to $1.50 higher. cotton unchanged:

FLOUR firm and in steady demand; sales of western superfine at $5 25@5 75; common extras at $6@6.75; Minnesota extras at $6 50@7 50; winter wheats at $7@7 50 for Ohio and Michigan; $7@$7 75 for Illinois and Indiana; $7 25@8 25 for St. Louis; patent Wisconsin and Minnesota spring wheats at $7 75@9 50; patent winter wheats at $7 50@9. CORN quiet; sales at 63@64c. for new; 64¾@67c. for old mixed and yellow. OATS firm; sales at 52@54c. for No 1 and extra white; 50¾@51c. for No. 2 white; 48@49½c. for No. 2 mixed and No. 3 white. RYE nominally 95c.@$1. SHORTS selling at $20; fine feed and middlings at $21@22. BUTTER.—New York and Vermont choice creameries at 32@34c. ₱ lb. fair to good 18@22c. and common 15@22c; Western choice creameries 33@35c; choice dairy packed at 25@28c. choice ladle-packed 20@23; fair to good do. 17@19c. and common 14@16c. CHEESE is in moderate demand; sales Choice Northern factory 12¾@13c. ₱ lb; fair to good 10@11¾c; common 7@9c. EGGS—Eastern at 22@24c; Northern 21@22c; Western 18@20c. ₱ doz. BEANS —Northern hand-picked Pea at $1 80@1 90 ₱ bushel; do. do. Western at $1 75@1 80; do common $1 65@1 70; medium choice $1 60; common to good $1 40@1 45; Yellow Eyes $2 10@2 30; Red Kidneys at $1.75@1.85; Canada Peas 80c@1 00 ₱ bushel for common to choice. Green Peas $1 60@1 85. POTATOES continue dull; we quote Houlton and Maine Central Rose 50c. ₱ bushel; Houlton Jackson Whites at 48@50c. Main Central Jacksons at 45@50. Vermont Rose at $45@50; do Jackson at 45@50. Peerless at 45@50, and Prolifics at 45@50c. ₱ bushel. SWEET POTATOES at $3.00@3.25 ₱ bbl for yellow Jersey, and $2 50@2 75 for Norfolk. ONIONS $3@3 25 ₱ bbl. Apples are in steady demand at $1 25@2 25 ₱ bbl according to quality. CRANBERRIES at $5 50@7 00 ₱ bbl. HAY AND STRAW—Hay has been in steady demand, first quality coarse Eastern and Northern hay at $16@17 ₱ ton; poor and medium at $11@15; choice Western timothy at $13@14 ₱ ton. Rye Straw $24@26 ₱ ton. COTTON, middling 12¾; low middlings 12¼; good ordinary, 11¾; weekly gross receipts 25,690 bales; exports to Great Britain 889.

WOOL.—The market is steady and in moderate demand, but firm, and there is no pressure to sell; sales, Ohio and Pennsylvania fleeces, at 49½@51c. for X, XX, and XXX and above; Michigan and Wisconsin fleeces at 47@48c. for X; medium and No. 1 fleeces at 53@57c., including Michigan, Ohio and Pennsylvania, and combing and delaine fleeces at 50@57½c.; unwashed wools selling 28@42c., including coarse, fine and medium, and some most desirable lots of medium not offered, except at a considerable advance on the latter rate. California wool firm at 30@40c, for fall; very little spring offering. Pulled wools in fair demand at 40@62c., including choice Eastern and Maine supers at 60@62c. There is very little doing in foreign wool.

Buffalo,—Wheat, corn, oats, barley and mill feed are the same as at last report; cattle and sheep somewhat higher; hogs from 5c. to 30c. lower.

WHEAT.—No. 1 hard Duluth, $1.45; Western and white do., $1.46@$1.47. CORN.—Quiet at Old No. 2. Western 53¾c. OATS.—Dull. No. 1 Western held at 45c; white, 46c; State, 46@47c. BARLEY.—Canada, 70@75c. RYE.—No. 1 Milwaukee held at 90c. MILL-FEED.—Selling at mills: Coarse, $15.00@16.00; fine, $15@16; finished at $17@$15. COTTON quiet. Middling, 12@12¼c. Weekly receipts, 1,079 bales; shipments, 218; stock on hand, 3,972.

Liverpool, England, Jan. 2. A leading grain circular says:—"The grain trade since Tuesday has been quiet, but prices have been firm in the faith of rather lower quotations from New York. Prices there must yet fall considerably to reach the level of those of Great Britain. Some of the provincial markets were even dearer than last week for foreign wheat. Native wheat is still in disfavor with millers. The imports into the United Kingdom last week were much below the average consumption. At the Liverpool market to-day there was a quiet trade in wheat, the turn in prices favoring buyers where any business was done, but the majority of holders were not disposed to accept a decline. There was hardly any inquiry for corn, which was offered at a half-penny per cental reduction. Flour and other articles were nominally unchanged, the other transactions being quite of a retail character."

WHEAT.—No. 3 spring dull at 10s. 7d.; do. 2 dull at 10s. 11d.; winter, new Western, dull at 11s. 7d.; do. new Southern dull at 11s. 8d. CORN.—Mixed steady at 5s. 8d. for old; steady at 5s. 7d. for new. CHEESE.—67s. 6d. per cwt. for the best grades of American. COTTON.—Futures closed firm; uplands, low middling clause, January and February delivery, 6 29-32d.; uplands, low middling clause, March and April delivery, 7 1-16d.; uplands, low middlidg clause, April and May delivery, 7 3-32d. The sales of the day included 8,550 bales of American.

Milwaukee.—Since last report No. 1 Milwaukee hard wheat has dropped ½c.; do. soft ½c.; No. 2 Milwaukee ½c. on spot and futures; No. 3 do. ½c.; No. 4 do. fully 1c., while rejected is 5c. lower; corn ½c. lower; oats ½c. higher; rye ½c. and barley 2c. higher. Dressed hogs, 10c. higher.

WHEAT, firm; No. 1 Milwaukee hard $1.31¾; do. soft, $1.31½; No. 2 Milwaukee, spot and Jan. $1.30¾; Feb. $1.31½; March $1.33⅝; No. 3 do. $1.15; No. 4 do. $1.07¾; rejected 95c. CORN dull; No. 39½c. RYE, firm; at 80c. Barley strong; No. 1 spring 77½c. Mess pork 13.50 cash. Dressed hogs in fair demand at $5.25@$5.30.

New Orleans—Since last report corn is from 2c. to 4c, and oats from 4c. to 5c. higher; hay about the same; pork, 50c. lower on old, and $1 on new. Cotton is ⅛ lower on middling and good ordinary. CORN active and firm at 59@65c. CORN MEAL, $2.50@$2.60. HAY in good demand, prime, $22.20; choice, $25@26. PORK, dull; old, $13; new, $15.50. RICE, Louisiana ordinary, 6@7¼c. BRAN quiet and weak, 77½c. COTTON, firm; middling, 11⅞; low middling, 11¼; good ordinary, 11¼. Weekly net receipts, 60,471; gross 56,523 bales; exports, to Great Britain, 13,750 bales; to France, 5,805 bales; to the Continent, 2,483 bales; coastwise, 11,186 bales; sales, 37,600 bales.

Philadelphia.—Wheat the same as at last report: except No. 2 red, which is 1c. lower; rye unchanged; corn a shade higher; oats, ditto; dressed hogs unchanged; Western reserve butter 1c. higher, other grades the same; no change in cotton.

WHEAT—In little demand; Western rejected, on track, $1.46; Penn. red, on track, $1.52; amber, $1.53¾; No. 2 red, in elevator, car lots, $1.52; amber at $1.53¾. RYE—Scarce; Penn. in demand at 98c. CORN—Active at old Southern yellow, on track, 63c; Southern white, in elevator, 63c. OATS.—Brisk, and firm at Western rejected, 46@47½c; fair to choice Ohio and Penn. white at 48½@49½c. DRESSED HOGS.—5¾@5¾c. BUTTER firm. Creamery extra at 32@34c.; Bradford county and New York extra at 28@30c.; Western Reserve extra at 24@26c.; do. good to choice at 18@22c.; rolls firm; Pennsylvania extra at 22@23c.; Western Reserve extra at 22@23c. EGGS quiet; Pennsylvania at 23c.; Western at 21@22c. CHEESE.—Steady; New York factory at 13@13¾c; Western full cream at 12¾c.; do. good at 11@12c.; do. skims at 7@9c. BRAN.—$17.50@18.00. COTTON—Quiet but firm; middling, 12¾c.; low middling, 12¼c.; good ordinary 12¼c. Weekly receipts, 6,108 bales; exports to Great Britain, 155; coastwise, 1,483; sales, 1,237; spinners, 6,472. WOOL.—More active and prices strong: Ohio, Pennsylvania and West Virginia—XX and above, 50@55c.; X, 50@52c.; medium, 55@58c.; coarse, 49@52c. New York, Michigan, Indiana and Western—Fine or X and XX, 48@50c.; medium, 54@55c.; coarse, 48@50c. Washed combing and delaine.—Fine washed delaine, X and XX, 52½@55c.; medium washed combing and delaine, 60c.; coarse do. do. do., 50@55c.; Canada washed combing, 50@55c. Tub-washed.—Choice, 55@60c.; fair, 50@54c. Unwashed combing and delaine.—Medium unwashed combing and delaine, 40@45c; coarse do. do. do., 40@42c. Bright unwashed Clothing.—Fine or X and XX, 30@23½c.; medium, 40@42c.; coarse, 38@40c. Dark, Earthy, Unwashed Clothing—Fine, 25@28c.; medium, 30@38c.; coarse, 28@30c. Oregon—Fine, 37@40c.; medium, 40@42c.; coarse, 30@35c. California—Fine, 37@40c.; medium, 37@40c.; coarse, 33@37c. New-Mexican and Colorado—Fine, 35@40c.; medium, 35@40c.; coarse, (carpet Wool), 28@30c. Pulled—Extra Merino, 45@50c.; super, 50@55c.; Lambs' super, 50@55c.

St. Louis.—Since last report, No. 2 red fall wheat has risen 1½c.; but has fallen a shade on futures; No. 3 do. has gone up 2½c. Corn 1c. higher; oats, ½c. lower; hogs from 10 to 20c. lower; cattle from 10 to 50c. higher all round. Sheep a shade higher. Cotton unchanged:—

WHEAT—Firm; No. 2 red fall, $1 36½@1 36¾, cash; $1 36¾@1 36⅞, Jan.; $1 40@1 41 Feb.; $1 44⅞@1 45¾ March; No. 3 do. $1 28 bid. CORN firm at 36¼@36½, cash; 36¾ Jan.; 38⅝ Feb.; 40⅝ March. OATS 37c. cash. HOGS dull; light shipping $4@4 10; packing $4 15@4 30; butchers' to select $4 25@4 40. CATTLE fairly active and steady; choice to fancy shipping $4 90@5 12½, one lot averaging 1,622 lbs., brought outside price; good to prime, $4 40@4 80; light steers, $4@4 30; feeders, $3 60@3 65; corn-fed Texans, $2 75@3 75. SHEEP strong, scarce and wanted; fair to fancy muttons, $3 25@4 15. COTTON, quiet; middling 12c.; low middling, 11½c.; good ordinary, 11½c.; weekly receipts, 14,720 bales; shipments, 15,476; sales, 201.

Toledo—Since last report amber Mich. wheat has fallen 1½c. and No. 2 red winter 1½c. No. 2 corn has fallen 1½c.; No. 2 white, ½c.; rejected, 1½c; oats, ½c. higher; clover seed, 5c. lower

WHEAT.—No. 3 white Wabash, $1;34½; amber Michigan, January, $1.39½; No. 2 red winter, spot and January, $1.41; February, $1.44½; March, $1.48; May, $1.53; No. 2 Dayton and Michigan red, $1.40; rejected, $1.12; No. 2 amber Illinois, $1.43½. CORN dull; No. 2, spot, 40¾c.; February, 42½c.; May, 47⅜c.; No. 2 white, 44½c.; rejected, 40⅝c. OATS dull; No. 2, 38½c. CLOVERSEED—Prime, $5.05.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 3, 1879.

BEANS AND PEAS.—The demand for beans continues light, but holders believe the downward movement in prices for standards has subsided. All sales of prime marrows quoted latterly at the extreme. Fancy beans at old prices. Southern B. E. and green peas steady. B. E., $2.25 per 2 bu. bag; green, $1.70@1.75; medium beans, fair to prime, $1.35@1.75; marrow, $1.40@1.65; pea, $1.45@1.70; w. kidney, $1.75@1 95; red kidney, $1.60@1.75; black or (turtle soup), $1.80.

Receipts of beans for week, 6,966 bush.

BROOM CORN.—Demand is fair; green stalk brald, in job lots, at 5½@6½c.; green hurl at 7@8c.; red and mixed at 4@5c.; fancy brush corn at 9c.

BUTTER.—The new year opens the market with considerable encouragement. Receipts are not heavy enough to give local buyers any independence, while a fair export demand and the filling of New England wants keep quotations well up to last ranges. State is materially helped by the light supplies of Western this season, but receipts of the latter will be apt to enlarge as January advances. Exporters would enlarge their purchases if holders would favor them in quality at the price now current, 23@23½c., for good, useful shipping grades. Freights abroad are unusually low, and shippers aim to avail themselves of cheap rates in all dairy products.

Comparative movement of butter from June 1st to January 1st past three years:

			Receipts, pkgs.	Exports, lbs.
June 1, '79. to	Jan. 1, '80,		1,025,400	232,278
" 1, '78, "	1, '79,		944,150	183,853
" 1, '77, "	1, '78.		869,850	136,136

Quotations:—State pails and tubs, choice, 29@30c.; good to prime, 27@28c.; fair to good, 22@25c.; full dairies, choice, 27@28c.; fair to prime, 22@26c.; firkins, fair to choice, 21@25c.; Welsh tubs, 22@25c.; poor State 20@22c.; creamery, fancy, 33@37c.; fair to prime, 27@35c.; poor to fair, 23@26c.; sweet cream, 33@34c.; Western imitation creamery, 23@28c.; dairy, fresh, extra, 25@26c.; fair to prime, 22@24c.; poor to good, 18@20c.; factory, late made, best, 22@23c.; fair to prime, 20@21c.; very poor to fair, 14@18c.; rolls, 19@22c

Receipts the for week, 15,120 packages; exports, 5,100 do.

CHEESE.—A very good business has been done, the holiday week considered, chiefly in good and under grades, with strong prices made.

Quotations are for State factory: Fancy, 13@13¼c.; good to prime, at 11¾@12½c; fair to good, at 10¾@11¾c.; half-skimmed at 9@10c.; skimmed at 7@8c. State farm dairy: Fine at 12@12¾c.; good to prime 10½@12c.; fair to good at 9@10½c.; skimmed at 7@8c. Wis. factory: Fine at 12¾@13c.; good to prime at 11@12¼c. Ohio factory: Cheddar, fine, at 12¾@12½c.; do., fair to good, 10@11c.; flat, fine, 12¾@12¾c.; flat, good to prime, 11¾@ 2¼c.; flat, fair to good, 10@11½c.; half-skimmed, 9@10c.; skimmed, 7@8c.

Liverpool freight, 17s. 6d.@20s.; Liverpool cable, 67s.

Comparative movement past three years from June 1st:

			Rec'ts, boxes.	Exp'ts. lbs.
June 1, 1879, to	Jan. 1, 1880		2,156,500	92,422,720
" '78, "	'79		2,687,300	105,042,208
" '77, "	'78		2,159,800	89,460,620

BEESWAX.—Small sales have been made at 24¾@25¾c.

COTTON.—The cotton exchange has been closed for two or three days. Through the holiday weeks business has been in consequence very light. The latest prices were for Jan., 12.59@12.60c.; Feb. at 12.90@12.91c.; March, 13.14@13.15c.; April, 13.32@13.34c.; May, 13.50@13.52c.; June, 13.68@13.70c.; July, 13.78@13.80c.; August, 13.86@13.90c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—Dealings have been small on account of the holidays and prices unsettled and nominal. For Apples—New North Carolina, at 6¼@8¾c. for fair; 10@10½c for choice: 11@11½c. for fancy sliced. Patent evaporated apples, choice, in cases, 15@16c.; do. fair, to good, 13½@14½c.; N. Y. State sliced, new, 7¾@8¼c.; quarters, choice, 7@8c.; new southern quarters scarce and nominal; new North Carolina peeled peaches at 17@19c., do., Georgia, 13¾@16½c. Peaches, Delaware evaporated, peeled at 25@28c.; do. unpeeled at 13@14c.; new halves at 8c. Blackberries at 9@10c. for new. Raspberries at 26½@27c. Pitted cherries at 18@21c.

Exports for week, 330 bbls. apples.

EGGS.—Receipts for the week, 4,918 bbls.; do. last week 4,950 do. Buyers stocked up pretty well during the holidays, and for the moment the market is quiet. Choice marks and small lots of fresh held the rates obtained when trade was running.

Near points 25@26c.; State and Pa., 21@23½c.; Western, fresh, 23c.; fair to good, 20@22c. Southern, 22½@23½c.; Canadian 18@20c; inferior or State marks, 17@17½c.; State limed, 16@16½c.; Canadian, 15@16c.; Western, 14@16c.

FLOUR.—The market has been moderately active and showing little change. The holidays and absence of cables from abroad have interfered with export trade.

Quotations are at $5 50@$ 00 for inferior to fancy superfine State; $6 10@6 30 for inferior to good extra do., odd lots and lines; $6.30@6.50 for good to choice do.; $5.50@6.00 for inferior to fancy superfine Indiana, Iowa Michigan, &c.; $6.10@6 30 for inferior to good shipping extra do., and $6.30@6 50 for good to very choice fancy shipping extra do.; inferior to about choice white wheat extras, $6.25@7.25, choice to strict fancy do. $7.25@8.50; red and amber winter wheat, inferior to fancy grade and family, at $6.25; round hoop Ohio, $6 15@6 80; and trade and family brands of do. at $6 65@8 10; the latter rate for fancy; St. Louis at $6 25@7.15 for inferior to very good extra; $7.15@8.50 for very good to fancy; Minn. clear, very inferior to fancy, at $6 15@7.25; Minnesota "straight," very inferior to fancy, at $6.50@8.00, and patent poor to very fancy, at $7 25@9.25; in bond stock at from $4.85@5 15; city mill extra at $6.85@7.10 for about fair to choice for West Indies (fancy do. quoted at higher figures); do. for England, $6 15 6.60 for poor to choice; do. trade and family extras, $7.25@8 25; do. for South America, $6.90@7.25; No. 2 at $4.50@5.25 for very poor to very fancy. Buckwheat Flour is selling at $2.00@$2.35.

FEED.—Sales of 40 to 60 lbs. at $19.00@$20.00; 80 lbs. at $20.00; 100 lbs. at $21@$22; Sharps at $21@$23.

FRESH FRUITS.—Apples are quiet, but there is a strong upward tone in prices for fine fruit. Lady apples have now merely a chance sale. Exports have suspended liberal operations. Spitzenbergs, ₱ bbl., $3@3.50; Baldwins, poor to choice, $2@2.75; Greenings, prime, $2 50; poor to good, $1.75@2.25. Cranberries show a reduced stock, and have advanced. Cape Cod, fancy, ₱ bbl., $8.50@9; fair to choice, $7@8.25. Other Eastern bbls. $6.50@8.50. N. J. crates, good to selected, $2@2.50. Grapes quotable when choice at $3 Catawba case. Florida oranges have not had the success of some former seasons; quality runs very uneven, and flavor is not as generally as fine: fancy half bbl. cases, $3.75@4; poor to good, $2@3; bursted crates, $1.75@2.50. Peanuts very steady after the free sales of late. Virginia hand-picked, 5@5½c.; good to fancy, 4@4½c.; Pecans $9@10¾ ₱ bbl.; Swellbacks, 80@90c. ₱ bush.

Exports for the week 6,165 bbls apples.

FURS AND SKINS.—Former quotations are something firmer, but not likely to have any real strength until after the London sales of January, at 19@20c. Stocks of American common show a large surplus abroad, and shippers do not express much confidence in higher rates for skunk and muskrat.

GRAIN.—The market has shown much activity, partly on account of the holidays abroad, and absence of definite markets there. Of wheat the latest sales are of No. 1 white at $1.55½@1.55¾; do., January, at $1.55@1.55¼; do., February, at $1.58½@1.59; do., March, at $1.61¾; ungraded white at $1.51@1.52½; No. 2 white at 1.53¾@1.53; No. 2 red at $1.57½@1.59; do., January, at $1.58@1.58½; do., February, at $1.61@1.62; do., March, at $1.64½@1.65; ungraded red at $1.40@1.54½; ungraded spring at $1 61@1.62. Rye at 98c. for State and Canada. Corn at for New York No. 2 at 62¾@63c.; do., January, at 61½@61¾c.; do., February, at 61¼@61¾c; do., May, at equal to 61.60c.; New York steamer mixed at 62@63¼c.; do., January, at 60¼c.; ungraded mixed western at 60@63¾c.; New York No. 3 at 61@61¼c.; round yellow new at 61¾c. Oats, No. 1 white, at 53@53½c.; No. 2 white at 52½c.; No. 2 white at 51c.; New York No. 1 at 51c.; New York No. 3 at 51¼@51¾c.; do., February, at 52c.; do., January, at 51c.; New York No. 3 at 50c.; ungraded white western at 52@52¾c.; ungraded mixed western at 51@51¾c.; white State at 52½c.; mixed State at 52c.; No. 2 Chicago afloat, at 51½c.

HAY AND STRAW.—Inquiry is very fair, and as receipts are moderate prices are well sustained. Shipping hay quoted at 70@75c.; retail lots at 70@80c. for medium, and 80@90c. for prime; clover at 55@60c. Straw at 85@90c. for long rye; 65@70c. for short rye, and 55@60c. for oat.

Exports for week, 1,420 bales.

HONEY—Supply under good control; prices steady. Single comb, white clover, ₱ lb., 18@19c.; larger pkgs, 14@16c.; buckwheat, 12@14c.; clover extracted, 11@13c.; strained, 8@10c.

HOPS.—Demand has been very light and prices have ruled weak, and in a good degree nominal.

Quotations are for New Yorks, new crop, choice, 28@40c.; New Yorks, new crop, medium, 34@36c.; New Yorks, new crop, low to fair, 20@32c.; Eastern, new crop, 30@38c.; Wisconsin, new crop, 30@38c.; Yearlings, 7@18c Olds, all growths, 4@10c.; Pacific coast, new, 35@40c.; Pacific coast, olds (nominal), 7@12c.; Bavarians, 50@65.

POULTRY AND GAME.—Turkeys have sold well at fair figures, but there has been no holiday gush in prices at any time. Supplies have been well sold up and moderate receipts will furnish early wants. Chickens and fowls abundant and ruling low. Geese in fair demand when prime. Capons quoted this week.

Turkeys, New Jersey 12@13½c.; State, Penn., and Western inc. Ohio, prime, 12@12½c; other, 10@12c.; Philadelphia, dry-picked, 14c.; do., chickens, d. p. 13@13½c.; do., Jersey, per lb., 9@11c; other fair to prime, 5@8c.; Phila., fowls, dry-picked, 10@11c.; State and N. J. prime, 7@8c.; poor, 6@6c.; Ducks, choice, 12@13c.; other, 9@10c. Geese, Pa., 9@11c.; others, 7@8c.; Capons well grown, 20@22c.; small and slips, 16@18c. Cooped stock low and not inquired for; fowls, 6@8c.; roosters, 4@5c.; turkeys, 9@11c.; Western, 8@10c.; ducks, pair, 45@75c.; geese, N. J., $1.62@$1.75; N. Y. and Penn $1.25@$1.50; Western, 87c.@$1.12.

There has been a good offering of game and with venison out of the way the demand is fair: Quail very plenty at $2 25@2.50; Canvas-backs, Havre de Grace, pair, $3.00@$3.25; W. and E. Norf., $2.50@$2.75; red-heads, 75c.@1 00; Mallards, 60c.@70c.; Black 40@60c.; Teal and common 30@40c; Partridges, State 75@80c.; Western, 65c@75c.; soft and drawn, 40@50c.; Grouse, $1.25; W. pigeons, $1@$1.25; Rabbits, 20@30c.; Hares, 30@35c.

OIL-CAKE.—Western is quoted at $35 per ton.

PROVISIONS.—Hog products have been quiet comparatively with prices, however, closing firm. Mess pork closed at $13.10@12.20 for old mess for January; $13.80@13.90 for new do. for do.; $13 35@13.95 for new do. for February, and $14 for March. Bacon at 7¾c. for long clear and 7¾c. for short clear. Beef Hams at $15.50. Beef at $10.50@11.00 for plain mess, $11.00@12 00 for extra mess; $13.00@13 50 for packet. Lard at $7.80@7 90 for Western steam on spot; $7.97½ for new for February; $7 85@7.87½ for old for do., $8.07½ for new for March; 8.17½ for new for April. Stearine at 7¾@7¾c. for Western. Tallow at 6 11-16@6¾c. for prime.

SEEDS—Clover is firm; Western at 8¾@9¾c. for about prime to extra choice; and 9¾@10c. for fancy. Timothy is quiet at $2.75 for prime. Flaxseed is dull at $1.70@$1.75.

TOBACCO.—Trade has been moderate the past week, with prices unchanged. Quotations are for

Reading for the Young.

THE "RURAL" TELEPHONE.

Fun for the Cousins.

HERE is something that will interest every boy and girl who reads the RURAL. Of course, all of you have heard of telephones, as they are now getting into very common use, and know that they are instruments for conveying sound from one place to another. Thus with a good instrument one can converse with persons several miles away just as effectually as if they were all in the same room, and the tones of musical instruments, singing, laughter, etc., are conveyed with equal distinctness. At the American Institute Fair, recently held in New York city, the visitors might listen to music and conversation carried on six miles distant, simply by holding a telephone to the ear. The "Rural" telephone is made for and supplied to us by Prof. W. R. Brooks, of Phelps, N. Y., who is the inventor and manufacturer. He sells them for $3 and $5 dollars a set (two), according to size;

a reliable, durable and perfect instrument for conveying the direct human voice over lines varying from 50 to 5,000 feet in length, when erected according to the directions accompanying each set, which are very simple and can be carried out by any intelligent person. These instruments use the direct sound wave conveyed over a copper wire, dispensing entirely with costly batteries and all magnetic appliances which are employed with more expensive instruments. The pattern is entirely new, and the most durable yet produced, being constructed of fine iron and hard wood neatly finished. The metal diaphragms are equal to those of the most expensive instruments. By means of two screws they can be fastened to the window frame, or other convenient place. A small hole is usually made in the window sash, through which the wire passes to the distant station. The voice is conveyed not only with great distinctness and volume, but retains all its individuality, so that the person speaking can be recognized.

As a "call" when you wish to send a message, a few sharp taps upon the specially constructed sensitive disc, are distinctly heard at the other end of the line in all parts of an ordinary room The straighter the line can be run the better, but a few angles, not too abrupt and kept from contact with trees and buildings, will not interfere with the proper working of instruments. The girls and boys can have no end of amusement, and establish the most complete communication with the houses of all their dearest friends.

Now we propose to present every boy and girl with a set of these telephones (two instruments, one for each end of the line) who will send us *five*, or eight subscribers, at $2 each. For five subscribers we give size A, which is used on lines from 50 to 2,000 feet in length. A set of size B, will be given for a club of eight subscribers. This size is of sufficient power to be used on lines up to 5,000 feet in length. The wire used is known as soft copper wire, and may be purchased at any hardware shop. For the long distance purchase No. 22 guage, for short distances No. 20 guage.

PRESERVING SOUVENIRS.

MRS. M. L. SAYERS.

During the mystic days of Indian Summer I visited one of the greatest natural curiosities of Virginia—a lake on a mountain 4,000 feet above the sea. I sailed above its mysterious depths, whose margin bristled with a thousand ghostly pines, bleached by the wash of half a century. I saw the sun rise in glorious divinity upon old Bald Knob, and I stood beneath the leap of the cascade in that fern-clad wild of primeval forest. The music of those waters, the luxury of those shades, the form and color of those rocks, produced an effect which the mind perhaps can receive but once, but will retain forever. And, though I cannot transfer it to canvas, I can imitate nature by piling up rocks and covering them with mosses, green and velvety lichens streaked with lights and shadows, and clumps of waving ferns, which grew into beauty beneath those eternal shadows. Thus my east window-sill has become a miniature Bold Knob, with its *mirrory* lake and *glassy* cascade. I crystallized the mosses, some branching as gray and bare as an oak forest in winter, some as green and feathery as the moaning pines, some as short and dark as mountain heather, and arranged them upon rocks to represent the peaks, in whose basin I placed a bit of mirror, in shape of the lake, with white stalagmites standing upon the margin and reflected in the depths like those submerged pines.

Farther on, to represent the leap of the mountain-torrent which fell like a silver veil from the brow of majesty, I arranged a fall of white spun-glass, and imitated the wild, untamed aspect of the surroundings by little bowlders of gray stone and rock crystals crowned with bits of drooping ferns, mosses and grasses crystallized to represent those eternal damps. Now every bright morning, I have a winter scene lit up by the same day-god which rises in such majesty and might upon old Bald Knob, when snow and ice and a million crystal drops, make it so beautiful and at the same time so impossible for me to behold, and my trophies are preserved inviolate.

Just above this hangs an airy phantom basket made of spirals and beads strung alternately, till 54 of each are shaped into a basket with wire, another is made of 34, and another of 24 spirals with beads between. These are fastened equidistant to bugle suspenders, (three) the smallest at the bottom terminating in a tassel. This triune affair is filled with crystallized grasses, colored according to Pipsey's directions, and resembles an inverted fountain, in shape, while it possesses all the qualities of the kaleidoscope for varying colors as it twirls and shimmers in the morning sun, each crystal becoming a prism and producing all the hues of the rainbow.

LETTERS FROM THE COUSINS.

Cousin "King George" on Kansas Orchards.

UNCLE MARK.—I write you although I am not a cousin, or, at least, I have never asked to become one; but my brother is a subscriber, and I look forward to each paper with pleasure, for I am getting interested in horticulture, agriculture and floriculture. I have studied botany and am very much interested in it. I have also had some experience in the vegetable garden. I am not acquainted enough with any one branch of horticulture to make a very long letter, so if I make a mixture you must not scold. First I will tell a little about Kansas orchards. The most Kansas apples are not so solid and juicy as those we used to have in Massachusetts, such as the Baldwin, Porter, Rhode Island Greening, Russet, Non such, etc. The standard winter apples in Kansas are Rawle's Genet, Winesap, Hutching's Pippin and Kansas Keeper. There is a great deal of discussion about trimming orchards, but the best orchard I have seen in Kansas never was trimmed at all. The owner has always taken pains to bend the limbs down to the ground and hold them there by putting logs and sticks and brush on them. He says horizontal limbs bear more fruit than upright ones, and I think he is right. The trees in Kansas cannot be left to grow so large as those in New England, because the high winds we have here would injure them and very likely ruin them. The trees in the orchard of which I spoke do not average over eighteen inches from the ground to the lower limbs. The southwest wind is the strongest; and nearly all apple, peach, pear and plum trees lean to the north and northeast, if not trained right when they are young. We have as many enemies of our apple trees here as in the East. The root borer, the limb borer, codling moth, leaf rollers, and a lot of others that have to be looked after and kept from doing as little damage as we can. It takes a great deal of time and work to keep an orchard as it should be, but if one likes the work, even if he is tired, he is not discouraged, but he will go to work the next day when he is rested, and work as hard as ever. The pear trees were blighted very badly last year. I do not know from experience what is the cause. I have seen some articles in the RURAL on the subject. I will give a theory of one of my friends. He says it is lightning, and the reason of it is that pear trees never blight in Oregon, and they have no lightning there (?). But I like what the RURAL says, for it looks more as if it was so. I fear Uncle Mark will say my letter is too long; but if it is not published, I know there is no great loss without some small gain. Father says the more I try to put my thoughts on paper, the more and better I can write.

A great many of the peach orchards are seedlings, and the farmers don't take any care of them. They are glad enough to get the peaches, and the more they get the "gladder" they are, but still they don't cultivate them, or dig the borers out of their roots, and so they last but a few years. There are a great many borers, and the trees need constant attention. The limbs should not get too long and straggling. A seedling tree will not form so nice a head as a budded one, nor will it have so nice, large fruit. The cling-stones are richer and juicier, I think, than the free stones, but if a person is in a hurry, he is apt to strike his teeth on the stone, and then he thinks he likes free stones the best.

There are three kinds of cherries that do well in Kansas, and I don't know but all kinds will, but I have seen these kinds do well. The Early Richmond, English Morello and Black Tartarian. The May Duke is not counted a good cherry here. We can a good many cherries and I like them much better if they have been pitted. I have learned how to graft and bud cherries. I like budding very much. The spring is the best time to bud, just as the sap starts, so that the bark will slip. Some persons bud in July and August, but I think more of the buds die because the wax or gum of the tree will ooze out and kill the bud. Grapes are very uncertain in Kansas except a few kinds. The Concord is the standard sort. The Isabella, Ive's Seedling and a few others are cultivated, but are not as likely to live as the Concord. The mildew is its worst enemy here, and winter-kill comes next. I like layering to get good, strong vines, instead of cuttings stuck in the ground. You go into a vineyard in August or September and take a long cane and lay it down on the ground, and before you throw any dirt on it take your knife and cut a little notch in it where you want the roots to come out, and then cover the notch with dirt. The roots will come out at the place you cut, and early the next spring you can take it up and set it out where you want it. I do not know enough about plums to say anything of these. I have a pretty flower-bed, but it is very small as well as pretty, and the flowers are mostly perennials, such as Roses (thirteen different kinds), Altheas, Bridal-wreath (two kinds), Lilac, Yucca, Lily-of-the-Valley, wild Verbenas, Japan Quince, flowering Almonds, Tuberoses, etc. I have also charge of the vegetable garden, but my sheet is full, and I am afraid Uncle Mark has already got out of patience. So my letter goes flying into the waste-basket, or into the stove to warm his toes one of these chilly mornings. KING GEORGE.

Burlington, Kansas.

UNCLE MARK:—I have for some time wished to write and acknowledge the receipt of the Cuthbert raspberry plants you editors so kindly sent. I am under many obligations to the senders, and highly pleased with the excellent manner in which they were put up for mailing. They were very fine plants, and the only improved raspberry plants I have planted here as yet, consequently I prize them much, and was thankful to receive them. Will you accept myself and "little boy," as members of your Horticultural Club? I am 28 years old, but I learn you take in members in the twenties. My little boy is nearly eight years old, he has had a little garden of his own for two years and is very proud of the flowers and vegetables he has grown. I have cultivated flowers and vegetables for 15 years and like to work in the garden. We located here in an open field, after building a house and barn 22 months ago; not a tree was here, no garden or yard was inclosed; we made a garden of nearly half an acre and I have growing 60 gooseberries, 75 strawberry plants, 50 cherry currants, and 37 grape vines. I raised 20 of the grape vines myself, also the currants. Last spring was our first experience in grafting. I grafted 100 apple trees, 35 pear trees and six cherries, out of the lot 85 apples, 20 pears and three cherries grew finely, nearly every one started to grow, but owing to the severe drought, many died. We are pleased with the result of our grafting, all are of the finest kinds of fruits. Upwards of 30 peach trees, we raised since we came here, which I budded last September, are doing well. Besides the above, we bought and set out upwards of 200 fruit trees, since we came here. Some of the cherries were full of fruit last summer. I also grew about 200 apple seedlings this summer, for grafting next spring. I must close by hoping you had a merry Christmas and wishing you a Happy New Year. Success to the RURAL, the best of papers I long may it live! Respectfully yours,

MRS. P. S. W.

Newmarket, Shenandoah Co., Va.

DEAR UNCLE MARK:—As my other letter was kindly received I will venture to write again. I have not seen any letters lately from the "Blue Hens' Chickens." That reminds me, we have a chicken that crows every night at nine o'clock. Won't some of the cousins please tell me how it knows just when that hour comes around? We had such beautiful weather all the fall and even now it is warm and pleasant, but I hope we will have a snow storm about Christmas. We do not have much sleighing here, but I like to see the trees and the ground all covered with snow. I am reading Joseph Cook's lectures now, and wish all the larger cousins could enjoy them. It is so much better to cultivate a taste for good solid reading than light novels. I am also very much interested in Uncle Mark's Horticultural Club as I love flowers. Over a year ago I commenced to study botany but am sorry to say I have not made much progress in it. I did not find it interesting studying all alone, having no teacher but dame nature and my text book. I wish the cousins could have seen my plate of flowers Thanksgiving Day. I had some lovely Roses, (the queen of flowers), some in bud and some in full bloom, and a white Camellia, white and red Bouvardia, Stevia, Fuchsias, Carnations, Geraniums, Ferns and different kinds of Geranium leaves. I must not make my letter too long or it may find its way to the waste basket.

Your loving cousin, HELIOTROPE.

—DEAR UNCLE MARK AND COUNSINS:—I thought I would report my last season's success although I have neglected to write for a long time, but I have not had much spare time. My bulbs had sixteen flowers each on a stalk. I was very much pleased with them. My radishes were large but strong. The soil was very dry. I would be very much obliged if Uncle Mark would tell me if drought have any effect on radishes in regard to their taste. I hope I shall have better luck next year. The corn ripened nicely. When I was in the hay loft pitching hay I accidentally stabbed my left foot with the pitch-fork and have been obliged to remain in doors for over two weeks. We have tried many remedies but found none to do any good until we poulticed with onion and salt which has had the desired effect to be well in a short time. We have had several snow storms. I hope I have not offended Bertha A. Weeks by the remark I made some time back. I like such letters as those of Ivy, Lilly Lee, Solomon Sap, Barney Blackstone, Young Tom and several others. I would like the cousins to write and tell how they bestowed their Christmas presents. I and my brother always had a Christmas tree and a gay time. I will close for this time, wishing Uncle Mark and the cousins a Happy New Year. BOB WHITE.

Rockford, Ill.

[Radishes are greatly injured by drought.—U. M.]

DEAR UNCLE MARK.—As I have not seen any letters from this place I thought I would write. I am twelve years of age. I live in Plymouth, but am so situated that I can have a garden. I raised some potatoes this year. I have gathered up seeds of all sorts, and of as many different kinds as I could get. I shall commence gardening next year in good earnest. I wish Uncle Mark would put my name on the Horticultural Club list. My father takes the RURAL NEW-YORKER, and I like very much to read it, especially the Reading for the Young. If I see this in print I will try again.

CHESTER H. CARPENTER.

Richland Co., O.

UNCLE MARK:—Will you please add my name to the Horticultural Club. I cultivate many flowers and shrubs in the garden and some in the house. Have Roses, Pelargoniums, Fuchsias, &c., as house plants My little boy of six, R. F. Thatcher, sends thanks to Uncle Mark for seeds, and has to report that he raised a bushel of beets, nine and a half bushels of potatoes and some other vegetables last summer, which he planted, cultivated and harvested himself. Yours truly,

Meeker Co., Minn. M. NELLIE BALDWIN.

UNCLE MARK:—Will you take a nephew from California? If so, you can put my name down. I am a farmer's son, and am 15 years old. Will you please to tell me the cause of curl leaf in the peach tree? From your CALIFONIA NEPHEW.

Penryn, Placer Co., Cal.

[You are welcome to join the Club. I wish I was able to answer your question in regard to curl in the peach leaf. No one knows exactly what is the cause.—UNCLE MARK.]

MAGAZINES FOR JANUARY.

Elliot; The Colleges for Women at Cambridge, Emiley F. Wheeler; Weeds, Mrs. Edward Ashley Walker; Estes Park and Long's Peak, Alfred Terry Bacon; The Old Men of the Bear and Ragged Staff; A Remarkable Book, Elizabeth W. Denison; An Evening at a "Workman's Coffee-Room" in England; David Ker; Obed's Subscription, Mary Wager Fisher; Editor's Table—Is this Flat Treason? Father Scully and the Schools; The Children's Friend; Recent Collisions of Church and State; Is the Indian Ever the Aggressor? Literature.

PERSONAL ITEMS.

General Burnside advocates Canadian annexation.

William H. Vanderbilt gave about $25,000 in Christmas presents.

Colonel Fred Grant, A. D. C., will go to Cuba and Mexico with his father.

Bayard Taylor's executor is selling lands belonging to the Cedarcroft estate.

Emma Young, one of the daughters of Prophet Brigham, is an actress in the Bella Union at San Francisco.

Ex-Senator Pomeroy, of Kansas, has a gold mine in North Carolina which pays him a thousand dollars a week.

Col. Robert G. Ingersoll from his profession and lectures earns from $40,000 to $70,000 a year, and spends most of it.

Mr. Spurgeon, who is writing at Mentone, France, is said to be not only physically ill, but also greatly depressed in spirits.

General Avezzana, one of Garibaldi's most famous companions in arms, is dead. He was President of the Italia Irredenta committee.

Thomas A. Scott, in reference to reports now going the rounds to the effect that he is hopelessly ill, says he has never enjoyed better health than now.

Bancroft, the historian, has given up his horseback rides, but works as hard as ever on his history. He talks very cheerfully of his old age and death.

Alexander Stuart, the wealthy sugar refiner, of New York, who died last week, leaves his whole estate, valued at $7,000,000, to his brother, Robert L. Stuart.

It is to be inferred, from the election of new directors, that the Keely Motor Company is still alive but it doesn't take much to be comparatively alive in Philadelphia.

To pass him "as they would a tree" were the instructions given to the laborers and tenants on the late Duke of Portland's estates if they should at any time meet the Duke.

Within the past year Sir Arthur Guinness has sold his interest in the brewery business for $5,000,000, and his celebrated stout is no longer a perennial fountain of gold to him.

General Grant remarked to a newspaper man in Washington that he thought he would soon be fit to take a seat in Congress. He alluded to the practice he was getting as a speech-maker.

In the list of Georgia lawyers who have received big fees, the Atlanta (Ga.) Constitution puts Senator Ben Hill first. He received in one case a fee of $140,000, of which $60,000 were paid in cash.

Major Wade Hampton, the Senator's eldest son, who died a few days ago, was in all the principal engagements around Richmond, and when General Johnston was assigned to the West followed him there and remained with him until the surrender. He was wounded at the battle of Burgess Mill, on the 28th of October, 1864, while bending over the body of his younger brother, Preston, who was killed in that engagement.

The ex-Confederate General Joseph E, Johnston was lately in Raleigh, North Carolina, and a gentleman asked him rathor pointedly why the Southern army did not take Washington after the first battle of Bull Run. Rising on his feet, he replied: "There were two reasons—myself and the Potomac River. I had reached that age when I knew an American soldier could not ford a river a mile wide and eighteen feet deep."

An agent of the RURAL, in Ohio, sends us a club of subscribers in which appears the name of Mrs. J. Birdseye of Clyde. This esteemed lady is an old friend of the RURAL who has now reached the rich age of four score years. She has taken the RURAL since the beginning of its third volume, and has preserved every copy up to date. We trust that she may enjoy good health and read the RURAL for many happy years to come.

William A. Owens, of Pine Hill, Ky., had killed three men in affrays, and he declared that having shed blood enough, he never would under any circumstances shoot at anybody again. Now, James Langford, a brother of one of Owen's victims, desired to take his life, and usually tried to do it whenever excited by drink. On such occasions, Owens always fled from Langford, and once was shot while speeding away on horseback. They met a few days ago in a village store. Langford was drunk and murderous. Owens hastily mounted his horse and rode away. Langford followed on another horse, firing frequently. At length Owen's horse threw him, and he found himself within close range of his pursuer's pistol. Then he shot Langford dead.

Ice water is perfectly harmless and more refreshing with a little Hop Bitters in each draught.

BRIEFLETS.

GET in your ice. . . Feed the sheep well—give them fresh, pure water and keep them out of the wet. . . Pigs need dry beds as well as other animals. . . A great deal of celery is rotting owing to the continued damp, wet weather. The covering material must be removed and, if possible, dried during sunshine. . . We understood that Mr. Reall threatened to resign as Secretary of the A. A. A. We are sorry, very, very, to hear that; not that we are confident that he will, or even fear that he will, but because it indicates there has already been a squabble or something of the kind. If Reall resigns it will require a big cord to hold the three A's together. . . Next to railroad monopolies, perhaps farmers suffer most from the impositions which patent-rights legalize. . . Here's something to talk about—Dr. Hager says that one part lupine seed and two parts rye make an excellent substitute for coffee—and they are more nutritious. . . One of the best and "cheapest" implements for stirring the soil of flower pots is an old four-tined table fork. . . Spring catalogues will soon be issued. Compare them—select the plants and seeds—then consult the RURAL'S Index which will aid in determining which are the best varieties. . . We do not propose to extend our notices of catalogues through several months. Seedsmen and nurserymen are requested to forward catalogues as soon as published . . Pres. Wilder is opposed to grass in orchards. . . Jean Sisley says that standard Roses present the ugly sight of a nosegay on a broom-stick. . . A Peoria woman sneezed her jaw out of place lately, and the married men of the place have been buying snuff ever since.—Boston Commercial Bulletin. . . We have given the Dentaphone to two deaf friends for trial. They were as deaf with it as without it. . . Mr. Loomis shows us the largest Japan Persimmon we have yet seen, says the Pacific Rural Press; it was grown at St. Raphael, Cal., measures 10½ inches in circumference and weighs 8½ ounces. The variety is the "Mikado". . . If we could have three finely-endowed and strictly-regulated medical schools—one at San Francisco, one at St. Louis and one at New York—and do away with the balance of these "hot-beds" for sprouting ready-made "M. D.'s," it would be an immense boon to the people of this country. So says a writer in the National Live-Stock Journal. . . The request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

AMATEUR DAIRYING--(First Experience.)

Oh, Charles! The man who sold you the cow must have deceived you! He said her butter would be yellow as gold; but see, the milk is white as chalk!

Charles thinks he has been taken in by the purchase.

This is, perhaps, the same lady who inquired after the cow that gave the buttermilk.

ESTABLISHED 1864. C. GILBERT'S STARCHES

ARE ABSOLUTELY PURE.

WE HAVE NEVER BEFORE made such a variety of Garden Wheel Hoes and Seed-Sowers.
WE HAVE NEVER BEFORE offered tools so well made, beautifully finished, and perfect in practice.
WE HAVE NEVER BEFORE combined so well variety of work with ease of operation. These machines quickly save first cost. They are prominent Agricultural *premiums*, and JAS. VICK says he has never sold any so popular. Correspondence is particularly solicited, and descriptive catalogues with numerous engravings are sent *free*.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXIX. No. 3. WHOLE No. 1564. | NEW YORK, JAN. 17, 1880. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural New-Yorker Company, in the office of the Librarian of Congress at Washington. — Entered at the Post-Office at New York City, N. Y., as second-class matter.]

RESULTS OF THE CONTEST.

The Rural's Corn Premiums.

WHO THE PRIZE-TAKERS ARE.

Best Yields from Blount's White Prolific Corn.

At the rate of over 183 Bushels of Shelled Corn to the Acre.

295 Pounds from 90 Kernels.

The First Prize--$100 in Gold, given by the Proprietors of the Rural New-Yorker, goes to N. Y. State.

SECOND PRIZE GOES TO IOWA.

The Third to Kansas.

GOOD CULTURE—GOOD YIELDS.

On April 26th, 1879, we announced a list of premiums that would be awarded for the greatest yields of Blount's White Prolific corn, which we at that time were distributing among our subscribers. The corn was to be planted within an area of 33 feet square, and we were to be notified of the exact number of grains planted in each case, but as to soil, culture, manure, etc., the competitors were at liberty to proceed as they thought best.

Thousands of our subscribers applied for the corn, and a large number registered their names as competitors. As the season advanced the corn developed some wonderful properties, which have been discussed in the RURAL from time to time. In the majority of instances it was pronounced a failure, mainly by reason of its growing season being longer than that of ordinary corn, and in various localities it was destroyed by frost before it reached maturity. On the other hand, many careful cultivators have expressed their satisfaction with it, and think it a desirable variety for general culture. The reports show that in some cases it has ripened well, while it has failed to do so in other cases in the same locality; this can only be accounted for by differences in soil and culture as well as by an unfavorable season.

Having scrupulously compared the multitude of reports received, and exercised the strictest fairness in awarding the premiums, we are now prepared to announce the result.

The prize-takers are as follows :—

THE PRIZES.

The prizes are awarded on the basis of the greatest yield from the number of kernels planted.

The first prize as stated above is $100 in gold.

The 2d prize, a feed and meal mill of the value of $65, is given by the Challenge Mill Co., of Batavia, Ill. This mill is adapted to wind or horse-power and has a capacity of 20 bushels per hour at a speed of 800 to 1,000 revolutions per minute.

The Giant feed mill, valued at $45, given for the third best result, is contributed by J. A. Field, Son & Co., of St. Louis, Mo. This mill has taken the highest premium at the St. Louis fair. It grinds with the husk on without extra attachment. It will be shipped on board the cars at St. Louis free of charge.

Prize number four, the "Veteran" corn-sheller, valued at $35, is given by the Sandwich Manufacturing Co., of Sandwich, Ill. This is a very complete sheller and perfect separator that works satisfactorily as a power machine. It has a revolving wire cob-rake and a fan for cleansing the corn.

The fifth prize is given by the Wheeler & Melick Co., of Albany, N. Y.

The prize-taker has his choice between a La Dow's pulverizing harrow and a two-horse disc corn cultivator, each valued at $30. Both of these implements have been figured and described in the RURAL. They are thorough and durable pulverizers, and for the size are not excelled by any other implement of the same class.

For the sixth prize Messrs. Rumsey & Co., of Seneca Falls, N. Y., offer a choice of anything from their catalogue to the value of $25. This firm manufactures metallic pumps, hydraulic rams, farm bells etc. in great variety, and is able to satisfy Mr. Bingham's wants in this line of goods.

The seventh and eighth prizes are donated by Livingston & Co., of Pittsburgh, Pa., who offer a hand corn-sheller of the value of $5 for each. We have one of these shellers in use at the RURAL FARM, and find it to fulfill everything claimed for it.

Dr. Wm. H. Chamberlin's Report.

The following extracts from Dr. Chamberlin's letter will help to explain how he obtained so large a yield.

"I have read with great interest the communications from the numerous correspondents of the RURAL in regard to their success with the Blount corn. I planted 100 kernels of the package I received—which were all the mice left me—on May 20. All did not come up until June 10. It was so cold and wet at the time here that I put glass over it to bring it out; but after it came up I had no fault to find with it, for it grew beyond anything I ever saw or heard of in the corn line. Day and night, week in and week out, it kept growing, and I thought, as many of our Rural friends did, that it was an earless sort of corn. However, about the 20th of July the ears began to show themselves, from three to ten on a stalk, and on the 25th of July the tassels were in sight. I never saw such corn for roots and suckers. On many of the stalks the roots and ears met. I did not disturb the roots but pulled nearly all the suckers.

There have been hundreds of people to see my corn, and without one exception, all thought it a great acquisition for general cultivation, and that it would eventually take the place of any corn we are raising in this part of the country.

I harvested it on October 1st, and to tie the stalks I used a step-ladder seven feet high, and hen could not reach the top of the stalks within several feet. They are from 13 to 15 feet high. I have a stalk in my office fifteen feet and one inch high now. The medium-sized stalks are much the more prolific. I have engaged all my corn for seed for next year, and could sell much more if I had it. I shall plant it for my main crop next year, as will also many of my neighbors. The only thing I can see against it is, that it may take too long a time after planting to mature it."

The following is Dr. Chamberlin's report which was duly certified to by D. W. Cole, a Justice of the Peace.

1. Date of planting, May 20th, 1879.
2. Date of harvesting, Oct. 1st, "
3. Date of weighing, Nov. 11th, "
4. Weight of shelled corn, 295 lbs.
5. Measure of shelled corn, 4 19-32 bushels.
6. Weight of stalks (cut up), 270 lbs.
7. Average number of ears per stalk, 5 8-9.—Whole number of ears grown, 630.
8. Character of soil, sandy loam.
9. Kind of manure used:—10 bushels of blacksmith-shop manure, consisting of horse droppings and hoof parings, with one bushel of refuse gas lime, spread evenly over a clover sod (clover eight inches high), and plowed under. I also used one gallon of liquid manure twice during the season, to each hill, made as follows:—two bushels of hen manure in 40 gallons of water.
10. Cultivation:—I cultivated the corn once, and hoed it three times, but did not hill it. All suckers were pulled except 100, on which grew 100 of the poorest ears of corn raised on the plot.
11. Number of kernels planted:—I planted 100, the mice having destroyed the balance of the package (25 kernels). It was wet and cold when the corn was planted, and ten kernels did not germinate, and consequently only 90 kernels came up.
12. Number of kernels in a hill;—one and two. I shall put three kernels in a hill next year and destroy all suckers.

WM. H. CHAMBERLIN, M. D.

Medina, Orleans Co., N. Y., Nov. 13th, 1879.

Mr. G. W. Strong's Report.

The report of Mr. G. W. Strong, of Davenport, Iowa, was satisfactorily certified to. We make the following extract from it, relating to his method of cultivation:

"The soil on which the corn was grown was upland prairie, that had been used for gardening, and was very rich. It had been well manured with barnyard manure. I also used 50 pounds of land plaster, four pounds of guano, and four pounds of bone dust. I planted the corn in drills, four feet apart, one kernel in a place, and the kernels 19 inches apart in the rows. I cultivated it with a hand hoe, but did not pull the suckers; nor do I think it would be best to pull them off. In applying the fertilizers I opened a drill the length of my rows, and then sowed plaster the whole length of the drill. I then planted one kernel of corn in each hill, making a ring, about three inches across, around the kernel with guano; then I covered all inside of the ring and over the kernel with bone dust, and finally covered the whole with about one inch of soil. The drills were four feet apart, and I hilled the corn very high, so as to make deep trenches. I had a well at the end of the plat, and during the dry weather I used to pump the trenches full of water two or three times a week; the consequence was that the corn grew sixteen feet in hight.

I do not think that the ordinary season is long enough for it here; but this has been an unusual season; frost held off very late, and it has been one of the best for corn for several years."

Mr. A. B. Dille's Report.

The winner of the third prize, Mr. A. B Dille, of Edgarton, Kansas, gives the following particulars in regard to the soil on which he raised the Blount's corn, and how it was manured and cultivated. "I planted 122 kernels in 100 hills, from which grew an average of nearly three stalks to each kernel. The soil was a black loam strongly impregnated with lime. It was heavily manured with manures from the hog-pen and stable. This was plowed in. On preparing to plant, I put, in addition, a small shovelful of manure in each hill. When the corn was six inches high I sprinkled a quantity of hen manure along the rows and gave it a thorough cultivation. During the summer the corn had four good plowings and was hoed clean twice. The season was favorable for corn throughout this county, and the yield was as good as we ever had. It is not uncommon for corn in this locality, with only ordinary care, to yield 70 or even 80 bushels per acre. It will be seen that this corn yielded at the rate of 160 bushels per acre, which is by far the largest yield I ever had. I do not deem Blount's corn as valuable a variety as the corn we raise here, but it is far more prolific. I intend to plant one bushel of it next season."

Mr. J. B. Chapman's Report.

Mr. J. B. Chapman, of Ovid, N. Y., who obtained the fourth best yield from the seed planted, gives the following in regard to the culture: "The soil is a clay loam. It was covered with a dense timothy sod, having been in grass for seven years. On this I spread one load of manure from the blacksmith shop. After it was plowed I put a little Farmer's Pride phosphate in each hill. The corn was planted the 21st of May and harvested November 20. During the summer it was cultivated twice and plowed once one way, and hoed three times. There were from one to five stalks in a hill, and from one to six ears on each stalk. Several hills had twelve ears, but in no case did I plant more than one kernel in a hill. Only 100 kernels came up."

We might continue to multiply these reports *ad infinitum*, but so much has already been said on the subject in the RURAL that this will be sufficient. One fact stands out prominently: in every instance in which a large yield has been obtained the soil has either been uncommonly rich by nature, or it has been made so by fertilizers, and the crop has received extra attention in point of culture.

In the case of Dr. Chamberlin, the yield was at the rate of 183 bushels of shelled corn to the acre, which is something astonishing. It is, however, absurd to suppose that the same ratio of yield could be maintained, had several acres been under cultivation, instead of a small fraction of one acre; and whether the actual increase that on a large scale could be reached over an ordinary corn crop, would be sufficient to pay for the expenditure of fertilizers and extra labor in culture on an equal scale as that expended by Dr. Chamberlin, remains yet to be determined. The yield is also found to vary greatly in weight. Dr. Chamberlin weighed one bushel and found that it turned the scales at 61½ pounds; from this the weight varied down to 55 pounds a bushel. These differences in weight must, in the main, be due to the difference in size of the kernels, which is found to be far from uniform.

The attention of our farmers has now been fairly called to this prolific corn, and the RURAL'S object may in this regard be considered accomplished; whether it is worthy of general introduction and extensive cultivation will soon be decided by the practical tests made by many of our farmers.

	Number of kernels planted.	Yield. Number of lbs. shelled corn.	Number of lbs. to each kernel planted.
1st Prize, $100 in gold. Wm. H. Chamberlain, M.D., Medina, New York	100	295	2.95

Field Crops.

SORGHUM-GROWING IN KANSAS.

I have raised different varieties of sorghum or Northern cane, and manufactured a good deal of it into molasses, making from 500 to 2,400 gallons in a season, doing a good deal of custom work. I generally succeed in making a good article of molasses, that will not only keep well any length of time, but which will improve by age, and sell in the home market at an average price of 35 cents per gallon. I never made any attempt at making sugar, not having any centrifugal or other apparatus necessary to separate the sugar from the molasses. My molasses granulates freely, and I am satisfied that with proper appliances and proper treatment, sugar can be made from our Northern cane. To make sugar in paying quantities it will be necessary to put up good buildings, and furnish them with good machinery and all necessary fixtures and appliances to handle it properly.

The majority of the farmers hereabouts look at the subject favorably as a means of supplying their families with a good and wholesome sirup, and raise enough for their own use. More farmers would raise it if we had more good and well-arranged factories to work it up and make a good article of sirup close at home. The manufacture of sorghum molasses as a business here is not very flattering, the market being limited to small quantities.

The cultivation of sorghum is very simple and easy, being the same as that of corn. But in the selection of soil, all black and rich bottom land must be carefully avoided, as sorghum raised on such land invariably makes black and strong molasses. Any naturally dry or well-drained upland will do. The ground should be as free from grass and weed seeds as possible, and put in good order by plowing and harrowing until it is fine and mellow. Lay off lightly with a three or four-row marker—such as we use here in the West for corn. Three and a half feet each way are about the proper distance for hills, or, if drills are preferred (which will probably yield more per acre), three and a half feet is the proper distance for the drills. In planting the seed, cover very lightly. The after-culture consists in keeping the ground well stirred and free from weeds until the cane is well headed out. In harvesting the cane for molasses, I commence as soon as the greater portion of the seed has passed into the dough state. I then strip, cut and work up as speedily as possible. For sugar it should be fully ripe. In boiling I have never used any neutralizing re-agent, but am satisfied such might be used to good advantage. Two things are indispensable: fast boiling and good skimming. The juice should never go down after it once begins to boil up, but should be kept boiling until it is ready to come off. Skimming should be carefully done whenever and wherever scum appears.

Coffee Co., Kans. AMOS ROSER.

AN EXPERIENCE WITH SORGHUM IN KANSAS.

THE growing of sorghum in Kansas has become an industry from necessity. There are many farmers here who can grow every year, without interfering with other farm matters, enough sorghum to supply their families with all the sirup needed, without any other expense than their labor, as there are mills that make up the cane either for one-half or for 15 cents per gallon of sirup. As yet there has not been much sugar made, as to do so successfully requires special apparatus. There are many instances here where the sirup has made sugar in the pan without the aid of any chemicals or extra labor, and all engaged in the manufacture of sirup think there is not the least doubt that sugar can be profitably made in Kansas from sorghum, if the right means are used in reducing the juice. Who will tell us what it is?

The question that first suggests itself is: What kind of soil is best adapted to the growth of the plant? My experience says that any soil that will grow good corn, wheat, or oats, will grow good sorghum. When should it be planted? The same time as corn. Here in Kansas we plant from April 1st to May 10th; but I prefer to plant from April 15th to 20th, as then the cane has a long season to mature. The preparation of the soil should be the same as for a good corn crop. We plow deep and harrow well and roll. No manure is used on the crop here while growing; it causes rust on and above the first joint. The mode of culture is optional with the grower; but the best results have been obtained by planting in drills 3½ feet apart and 15 inches in the drill. We find that it can be handled to much better advantage in drills than in hills when stripping time comes. Stripping should not be done before one is ready to make up the cane, as it promotes the growth of suckers. With us these do not start until the cane is ripe. Cultivate the same as corn—well. The average yield of juice per acre, as far as I can ascertain from others and my own experience, is, on new broken sod, 750 gallons of juice, equal to 150 gallons of sirup, weighing 18 pounds to a gallon; on old ground that produced 60 bushels of shelled corn the quantity was 1,000 gallons of juice, equal to 200 gallons of sirup, allowing five gallons of juice for one gallon of sirup.

The Early Amber did better; with it less than four gallons of juice made one of sirup. The net profits from sod would be $26 25. There is no other crop on sod that will produce $10. On old ground 200 gallons, allowing one-half for making, would leave $35 net per acre. You would have to get 140 bushels of corn at 25 cents to make $35, or 35 bushels of wheat at $1 to equal the sorghum.

I cannot see that there is any more expense in raising sorghum than there is in raising corn or wheat, and each can easily estimate the profits by the crop he raises, and the price he gets for the product in his own locality. There are several associations formed around the country for the benefit of those interested in the growing of sorghum. The meetings of these are very well attended and much interest is taken by farmers generally. W. J. BROWN.

Butler Co., Kan.

EXPERIENCE WITH SORGHUM IN OHIO.

LAST spring I procured from the Department of Agriculture a package of seed of the Minnesota, or Early Amber sugar cane. I planted two patches. Of the one that did the best, I now propose to treat.

The patch was planted about the 10th of May, and cut about the 8th of October. It contained between thirteen and fourteen square rods, was plowed four times and hoed twice. The soil is a yellow clay, interspersed with a little sand and gravel, and tolerably fertile, and the yield was, by accurate calculation, at the rate of a fraction over 214 gallons of thick molasses per acre. This was put into earthen jars, and, on unsealing them, the lower half is found to be granulated, the mass soon becoming dry by exposure to the air, but containing too much gum to be equal to common Orleans sugar.

In the manufacture, the juice is conducted through a tin tube from the mill to the first evaporator where most of the green scum arises and is taken off. From thence it passes out over a layer of gravel and pebbles, till it reaches a second evaporator, made after the style of Cook's Patent, where the final boiling and drawing off occur. No solution to clarify the juice was employed in the operation.

I think that it has been demonstrated that the Early Amber is superior in every respect to all other varieties of sorghum now in cultivation. It ripens earlier, enabling the cultivator to get it worked up before any of the fall frosts occur; it produces a much purer, sweeter sirup and a larger amount per acre. The indications are that there will be twice as much planted in this vicinity next season as there was in the year that has just come to a close, and nearly or quite all of it will be of this variety. It is to be hoped that some genius will so perfect the construction of sorghum mills and apparatus for granulating the sirup, that in a very few years this nation will cease to be under the necessity of sending abroad for sugar.

In conclusion, permit me to remark that the practice, once so common, of stripping off the blades several days before cutting the cane, is much spoken against here by molasses manufacturers. They say that the juice begins to sour from the first, and that the cane should be cut down on the same day that the stripping is done. And, furthermore, it is requisite that it should be cut while the seed is in the dough, and the grinding and the evaporation of the juice be attended to as soon thereafter as possible, to obtain the best results.

Morrow Co., O. JOSHUA MORRIS.

Experience with Sorghum in Illinois.

I got some Early Amber seed from the Department of Agriculture at Washington, and planted it on May 14. The weather was so dry that I did not get half a stand. The cultivation was the same as for corn, except that it received some extra dressing with a hoe. It commenced to ripen about the 15th of August and was ripe the 1st of September, when a frost almost ruined it. Then it was cut and piled, and laid there three or four weeks before it was made up. It made good sirup, but this did not granulate well. I made about 700 gallons of sirup for my neighbors. I made theirs before my own, and therefore had better success. Most of it granulated in the coolers when it was made, or soon afterwards. I think that to secure the best success in granulating sirup, it should be kept in a warm place, in open tanks or barrels. I put some in open tanks, and some more of the same kind in tight barrels. That in the barrels granulated pretty well, but that in the tanks did much better, all of it turning to solid mush sugar, with the exception of a little molasses on the top.

Bureau Co., Ill. M. A. COLBY

A POTATO QUESTION IN TENNESSEE.

IN February last I bought of J. M. Thorburn & Co., of your city, one barrel of Beauty of Hebron potatoes. I raised a second crop, planting the last time on July 23 and 24. I saw by the advertisement that they purported to be a week earlier than the Early Rose potatoes. In our section, our farmers have found that they can grow and market a crop of Early Rose by 10th to 25th of June, and by planting the small, unmerchantable potatoes they can grow a second crop, which is usually nipped by the early frosts, though that does not affect the tubers, and these, dug a week or ten days after first frost, yield good, full, plump tubers, not as large as Northern potatoes of the same sorts, but we, here, believe them superior in mealiness of flesh and in flavor. I experimented this year with one barrel of Beauty of Hebron (supposed to be New York State seed) and one barrel of second crop Early Rose of my own growing. I planted both on March 12, in precisely the same sort of ground—only divided by a ditch. I gave both the same cultivation and on the 26th of June marketed my Early Rose. During the "growing season" I several times examined the two kinds and each time I found the Hebron showed the larger tubers of the two; but the Rose had more in number to each vine. My experiment cannot be completed till another spring crop shall have been grown and by planting Early Rose and Beauty of Hebron, both of second crop seed and under the same conditions, I shall hope to settle the question of early maturity as between these two varieties.

A good many second crop Early Rose potatoes are being shipped from our locality for seed, to points northwest of us, and if our second crop seed shall be found earlier than Northern seed of the same varieties, why should not the shipping of second crop potatoes of this section to the colder section where only one crop can be raised, be found an important industry developed with profit to somebody and supplying the tables of your section with that valuable vegetable earlier than your seed will furnish them?

Davidson Co., Tenn. JAMES J. PRYOR.

Farm Topics.

HISTORY OF A POOR FARM.—No. 22.

FARMERS' FAMILIES.

OUR little society has become by degrees very much of a sociable family affair, and we find ourselves frequently discussing matters which relate to our various family interests, as they depend upon our different farm managements. We have around us a peculiar sort of society. There are old families in our neighborhood who have owned their farms for a hundred years or more, and many new-comers who have bought parts of divided farms which have been sold to be distributed among heirs who have left the old homestead and have gone into distant localities to enter into business or into new associations or family ties. The old and the new still retain their distinctions and their different ways, and this offers unusual opportunities for contrasting the results of the varying methods of management. My old neighbor thinks there is nothing like the old style of doing things, and still retains full control of his farm and his family, although his grandson who works the farm is over 40 years old and is practically responsible for all the work. Mr. Martin thinks this is not just. He says:—

"Give the young folks a chance; let them have an interest in the farm and the business; and make them feel they are doing something for themselves. I have no son, but my daughter, Mary, runs my dairy, and what she can make out of it, is hers to do as she thinks best with it. What is the result? She is thoroughly interested: studies all about her business and won't be in a hurry to give up that to go off and get married, unless she is making a good match; I mean by that, to choose a good, industrious, careful, steady husband, with some ideas consistent with her own; and not take some flashy city man, who would spend in clothes and cigars as much as would keep a family. It is all very well to talk of love in such matters as this. Love is a sentiment, and its direction takes the channel in which young folks have been trained. There must be something for love to live on, else when trouble comes to the front door, it will fly out of the window. It is a more serious matter with boys than with girls, because a boy is apt to pack up and leave "to do for himself" if he thinks he is not justly dealt with. Parents should feel that they are responsible for the welfare of their children, and that a family, as far as may be, should be a partnership; more especially if there is but one to be taken care of. I like the idea of father and son—or daughter, if there is no son—going into partnership and having a mutual interest in the home and the business."

"If this had been the practice years past, there would not be so many farms lying idle in the East," said Dr. Jones, "and many young folks would have been spared much hardship in making new homes in the West; while the old folks would not have been left practically childless in their old age, and have been compelled to leave the farm and live in a village, upon their savings, which might otherwise have been nursed and increased to help the children when the parents no longer needed their money."

"Here is Mr. Close, whose farm is in the flats, rich meadow land and upland, and over 250 acres. He is over 70, and has two sons; one is in the Western mining region, and a thorough rover, and the other has a store in a Western city. He has seen neither for a dozen years. His farm is going back to the condition of a wilderness, and the whole feeds but five cows, a pair of oxen and one horse. The old man keeps pegging away as well as he can, with the old lady for his only companion; and there is work on the farm for both the sons and two or three hired men, if they had been content to stay. But Close kept the boys at work, and doled out a few dollars to them now and then, and wanted to make a hard bargain with them to rent out the farm on shares when they became of age. So they left; and by and by the Close farm will be sold to be divided among the heirs. There might have been three farm houses across the road in place of one, and two or three laborers' cottages; 50 or 60 cows in place of five, and three happy families with uncles and cousins and aunts, in place of a dull, dreary, solitary old couple; and Close thinks his boys used him rather badly in leaving him all alone."

"I think that was right mean of the old man," remarked Miss Martin, who had just come into their pleasant parlor, "there were never better boys anywhere than the Close boys, and they worked very hard, early and late, to please their father; and that reminds me of what I read last week of a man who gave his boy an orphan lamb, and the boy nursed and brought it up until the fall, when it went to the market with the rest of the flock, and the boy cried and said he would never raise another lamb. The paper said that was the meanest robbery ever perpetrated. That was just the way the yoke of steers that the oldest Close boy raised from calves went, and one of them he bought from us with his own pocket-money when it was a week-old calf."

Here our old neighbor dropped in, and we at once changed the conversation, lest he might think it intended for him. He has, however, quite a different disposition from that of Mr. Close, and although his grandson is simply a tenant on shares, without any permanent interest in his grandfather's farm, yet the two are quite well satisfied, thinking it to be a matter of custom, and having no jealousy of each other's interest. Still even in this case it works to a disadvantage, and prevents improvements which ought to be made.

"Here is another new idea," remarked the old gentleman, opening his copy of the RURAL NEW-YORKER, and putting on his glasses. "This will suit you, Miss Martin, no doubt; for it is just your way of doing things. They are getting up a Society to record tests of dairy cows; I suppose putting the weights of milk and butter in a book, and paying your two dollars for it. What good is that going to do?"

"I approve of that," said Miss Martin, "and I shall be willing to pay a few dollars to have some of our cows' names in that book. Why, we have some cows that don't pay for their feed, and I never knew it until Fred showed me how to make and keep a record. Jenny's record shows that she gave as much butter as three other cows together in the six months they have been milking, and they have all been fed alike. Star gave only two pounds and a half in seven days, and father thought she was his best cow, because she would fill a pail with milk. Jenny's cream is three times as thick as Star's, and we never knew it until we kept a record. Father did not think Jenny worth half what he would have sold Star for, until we found out the old cow's value. Now Star's calves go the butcher, and we raise Jenny's heifers always."

"A cow is a cow," said the old gentleman, "and you can get as much for one as another when you come to sell. I like an easy-keeping cow, that you don't need to be always buying feed for."

"Of course, you like to make cows pay, don't you?" said Miss Martin. "Well, let me read this to you; this is a record of Jenny, my Jersey cow. This is my cow because I raised it, you know, and father will never sell her, you may be sure, because he gave me the calf. Well (reading), week ending Nov. 15, 168 lbs. of milk; Nov. 22nd, 161 lbs.; feed hay and four quarts of meal, corn, oats and middlings, with one peck of beets; Nov. 29th, 198 lbs. of milk; Dec. 6th, 231 lbs.; feed same as before, with four pounds of cotton-seed meal added; now, four pounds of cotton-seed meal cost seven cents, which is 49 cents a week, and 63 pounds

of milk are worth $1.62. Next week I can give you a record of the amount of butter made extra, because each cow is now getting four pounds of cotton-seed meal a day."

"I think that is worth knowing," remarked Dr. Jones. "If no record is kept, no one can know these things. I am ashamed to say that I don't know which is my best cow, or if the cows pay for their feed or not. But hereafter I shall keep a record of their milking; there is very little trouble about it."

"It is no trouble," I replied; "Miss Martin is following my plan. A spring balance with a hook hangs in the barn in the rear of the cows. Close by it, hangs on the wall, a paper block with a column for each cow; the cows are numbered on the stanchions, 1, 2, 3, and so on, and each one's number is written at the head of the column on the block or paper pad. Each cow's milk is brought to the deep pails in which it is strained, and before it is poured out, the pail and milk are weighed. The pail weighs three pounds exactly, and the net weight of the milk is written in the column belonging to each cow. The same is done morning and evening, and at the end of the week the sheet is taken from the block and filed away after the total of the week's weights is entered in a book. When a change of feed is made, that is noted across the block before the weight of the milk is written down, and is also entered in the weekly report book. The whole work does not take ten minutes each day, and it enforces cleanliness, because a little water is poured into the pail after the milk is strained, and the dregs of the milk are washed out and thrown into the gutter. Each cow is thus milked into a clean pail, and, if necessary, the milker washes his hands after milking each cow. That takes up a little time, but it is well spent. For what butter I make I can get 20 cents a pound over the common market price, and I have the pleasure of knowing that the milk I sell is absolutely pure and clean. Besides, I think it due to the cows to keep them clean; they seem to know it, and feel proud of it.

"How do you record the butter made?" asked Dr. Jones of Miss Martin. "Each cow's milk, when it is tested for a week, is strained into one particular pan. I have to use three shallow pans for this purpose, and the milk stands 36 hours, which is long enough to get all the cream. Every week I keep this one cow's milk by itself in a separate crock, and have it churned separately, so that every ten weeks I can get through the whole list, if I want to, and know exactly how much butter each cow made in one week. But I can tell pretty nearly by the cream if there is any gain or falling off when I skim the cream. Of course, it takes some time, but it takes time to do many things that we are obliged to do, and we don't grumble at it."

"There are a great number of poor cows in the country" I remarked "and a good many good ones. We ought to know the good from the bad. Miss Martin raises the heifer calves from her best cow, but if she did not know the best cow, the worst one's calf might be raised. If this plan is followed, in five years the value of the dairy cows might be doubled. We have had so many figures about cows etc., poured out on to us by speakers at the late dairy fair, that I wont give you any more; but what I say is true, and you know it. Now there are a great many good cows in the country and it is important that every dairyman should know it. When I want to buy a good cow and pay a good price for her, I want to have a record of what she does and what her dam and grandam did, and by-and-by we shall have records of thousands of such cows. Then if owners of cows can be taught to keep records, by-and-by it will be only stupid men and fools who will keep the poor cows; and in time these—the cows I mean—will all die off and be got rid of.

MY EXPERIMENTS.

I regret to say that my hot-bed played a trick on me which resulted in the loss of nearly all the seeds sent from the RURAL office, as well as other valuable seeds and plants. I have some very nice plants of Hollyhock, however; and as I am partial to this old-fashioned, but now very much improved flower, I prize them highly. The spring wheat was a failure, and I have known but three good crops of spring wheat in this section in twenty years, while winter wheat seldom fails. Millet made a good growth; but as a forage plant in this latitude I think it undesirable. No plant will ever fill the place of corn as a fodder crop in a climate where it does as well as here, while hay made from mixed grasses gives so much more nutriment in the same bulk for winter use that farmers, taking into consideration the cost of cultivation of fodder crops when compared with that of hay, prefer the latter even against the experience of their neighbors who grow corn fodder.

The Voorhis watermelon was a grand success, productive, with thin rind and of good quality, and large enough, while in symmetrical shape, evenness of size and general beauty of appearance it was ahead of all my melons. The other melon I shall raise is Phinney's Early; it is good enough, and resembles the Voorhis in appearance, though more uneven in size and not so handsome, but more productive with me and a very sure crop; the Voorhis may be equally sure upon a longer acquaintance. The Blount's corn I did not apply for, and I am glad I did not now. I am prejudiced against large varieties of corn. They do not pay. The stalks do not make good fodder; the corn is no better than smaller kinds, while the great cobs and stalks are a perfect nuisance. I except Mammoth Sweet corn from the above, as all sweet corns, when properly grown and cured, make good fodder. The Golden Rural tomato is "nice"; but not profitable for me to raise. We do not preserve tomatoes; we grow all the berries and small fruits and when one has enough of the good pickles, preserves, and canned nice things that can be made from these fruits, there is no room for tomatoes; for canning and table use no tomato yet equals the Acme, though the Trophy is almost as good. The Beauty of Hebron is a valuable potato, and while I am not going to say it will supplant the Early Rose, Vermont or Ohio; I do say it will hold its own. I had a good yield and we tested the quality while green and fully ripe, and pronounced it among the best.

While I am talking about potatoes I may as well give my experience. I have twice discarded the Early Rose for other varieties; once for the Extra Early Vermont, and once for the Early Ohio, and while I retain both kinds now, I was obliged to get back the Early Rose. I am in favor of early potatoes, as the crop can be marketed early and the ground sowed to fodder corn, turnips or wheat, and even if the market for these is low, they can be pitted in *shade* thinly covered, and repitted in autumn with perfect safety. My favorite late potato is the Excelsior. I am growing seedlings from this variety; some are now four years from seed. Some are very valuable kinds of late potatoes, but none are valuable that ripened earlier than "medium early".

I have for several years made some interesting experiments with potatoes, as I am what is here called a large grower. My hired man, one spring while we were preparing potato seed, thought I was too particular about my selection of seed for the "seed patch". I had a model potato in my mind, and selected perfectly shaped and even-sized tubers to select another year's seed from, as had been my practice. To convince him of the advantage of my method, I selected some ill-shaped specimens, knotty and gnarled, and we planted them alongside the seed patch planted with potatoes every one of which was a beauty. When we dug both patches I was surprised myself; the experiment taught me an important lesson as well as him. He learned that like will inevitably produce like in a greater or less degree; I had the new thought forced upon me that we can deteriorate a variety faster than we can improve it. The proof was before me in about a bushel and a half of Early Rose potatoes with scarcely a mess of tubers that the house-wife would prepare for the table; while the adjacent row turned out finely-shaped potatoes, no cragged ones, and a very small portion of small ones. If this is true of potatoes it is of grain, fruits, stock; in fact, of all we raise or breed. [Not to the same extent at all. The remark is true enough of seeds or blood. But a potato is merely a fleshy stem.—Eds.]. I am now in possession of a strain of Early Rose potatoes improved in shape by selection. There is a tendency in this potato to grow long, and in some soils a little sharp at one end. This tendency I bred away by selection of seed, which is a valuable experiment and within the reach of all who read and discredit this statement.

I would urge more attention to the improvement of varieties of grain and vegetables, and in conducting experiments with these have some point you wish to reach, a model to work to. Give the public the benefit of your experience. Your neighbors may be merry over your "fooling around"; but the experimenter is gaining knowledge while the laugher is merely being amused. Don't try too much at once, follow one or two experiments carefully until you are either successful or obliged to acknowledge defeat. E. L. M.

Huron Co., O.

SO-CALLED MODEL AND EXPERIMENTAL FARMS.

THE gentlemen owning them profess to teach the common farmers. Why don't they experiment with different kinds of food and tell them which varieties and in what proportions, produce the most and the best milk? Why don't they try cows one week tied up with chains, another fastened in stanchions and another lying loose in boxes, and see the effect on the milk and on the weight of the animals? Why don't they try different foods on fattening animals, on cows, on sheep, and on swine? And why not experiment with horses, too, and give the results? What is the use of boasting and puffing about a farm and giving the public no information? A very great deal of good might be done to our stock interests by a systematic course of treatment and trying one breed of cattle against another. For instance, supposing on one of these farms there happened to be Short-horn cows, Jerseys and Holsteins; take a fair average cow from each breed; weigh the food to each and ascertain which gives the most milk and the most butter, and by calculating the food eaten by each, see which pays best for eating it, and also try in a similar way some animals of different breeds for beef. Some good experiments, too, might be made with sheep:—take half a dozen ewes, say, pure South Downs, half a dozen grade Downs, the same number of grade Merinos, and weigh the food to each and see which bring the best early lambs; which yield the best clip of wool, and also try a similar number of barren ewes or other sheep, and test their qualities for making mutton and wool. Without hinting at, or intending to direct attention to any one farm, what, in the name of common sense, is the use of calling a farm *a model* when there is literally nothing to take an example from:

We want something original; something modern, and we don't want to wait years for it. Let us have prompt action and when any information is offered, we don't require a compiling of old-fogy ideas from books half a century old. The days of compilers are past! The present age requires genuine, live, truthful experiments made very carefully by a man who knows all about farm live stock of every variety. If he is not interested in any one of the breeds more than another, so much the better. We have, every now and then, a breeder claiming all the virtues in the world for his particular herd or flock; but a reliable test made by two or three of these model farms, would throw light on the subject, and if the results were not wholly satisfactory, they would lead to other and more exact tests. Let these farms grow roots of every variety and by intelligent use of them ascertain their real merits in the climate of the United States. I know they have been almost extraordinary assistance to British agriculture, and it is well understood the breeders of pure-blooded stock in the United States, all grow some, as they cannot keep their stock from falling away without them. Consequently, let the model farmers throw light on this matter, too. G. M.

The Herdsman.

WINTER FEEDING FOR STOCK—No. 3.

PROFESSOR E. W. STEWART.

Waste Products as Fattening Food.

MANUFACTORIES have multiplied so rapidly within the last few years, at which large amounts of waste products are left after the production of the commercial articles, and these refuse products have such importance as feeding stuffs as to require special attention in discussing winter feeding of stock. That RURAL readers may get a clearer understanding of these waste products and their comparative value, I give a table containing their digestible constituents, nutritive ratio, and value compared with average meadow hay, which is rated as the unit of value. I give only the percentages of the digestible nutrients, because these determine the feeding value.

Foods.	Digestible Nutrients. Albuminoids.	Carbohydrates.	Fat.	Nutritive Ratio.	Compared with meadow hay.
Meadow hay, average	5.4	41.0	1.0	8.0	1.00
Clover hay "	7.0	38.1	1.2	5.9	1.08
Timothy hay "	5.8	43.4	1.4	8.1	1.09
Hungarian hay "	6.1	41.0	0.9	7.1	1.04
Wheat bran (coarse)	10.0	48.5	3.1	5.6	1.58
" middlings	8.9	51.8	2.6	6.9	1.56
Western ship stuffs	8.7	54.5	2.5	7.0	1.51
Rye bran	10.6	50.0	2.8	5.3	1.56
Buckwheat bran	13.5	44.0	3.9	4.1	1.79
Poppy-seed cake	26.8	26.4	7.4	1.7	2.69
Hemp seed cake	20.9	17.4	5.2	1.5	2.03
Olive-oil cake	3.6	33.8	10.6	16.5	1.42
Sunflower cake	31.3	21.7	7.6	1.3	3.00
Palm-nut cake	16.1	55.4	9.5	4.9	2.51
Sugar-beet cake	1.8	21.6	0.2	13.9	.047
" molasses	8.0	64.0	—	8.1	1.43
Potato refuse in starch manuf'ng	0.8	13.7	0.1	17.4	0.25
Rye " " "	5.2	18.1	1.2	4.1	0.68
Wheat " " "	3.7	15.1	1.8	5.3	0.58
Corn bran	5.2	55.0	3.6	10.3	.112
Corn sugar, or starch meal	3.2	19.3	1.8	7.4	0.60
Corn slump, or distilling refuse	1.5	5.4	0.8	4.6	0.24
Brewers' grains	4.8	11.3	1.2	3.0	0.56
Malt sprouts	20.3	43.7	0.8	2.2	2.08
Linseed cake	37.6	27.0	10.4	1.4	2.96
Linseed meal (extracted)	27.8	33.9	2.1	1.3	2.51
Cotton-seed meal (decorticated)	33.2	17.6	16.2	1.1	3.60
Cotton-seed cake (undecorticat'd)	17.5	14.9	5.5	1.2	1.75
Meat scrap	45.0	—	2.0	0.1	3.17
Fish scrap	44.6	—	8.6	0.2	3.60

These are the principal waste products, and their comparison with the different kinds of hay and with each other will be instructive to many readers who are in doubt as to the relative value of these various foods. Some of these waste products will be found in almost every locality, and it should be the aim of all feeders to utilize the cheapest foods, which will accomplish their purpose. The reader should give careful attention to the nutritive ratio—this means the proportion of muscle-forming food (albuminoids) to the heat-giving and fat-forming nutriment (carbohydrates); as, for example, meadow hay is as one to eight.

All vegetable foods contain both classes of these substances. The albuminoid substances are called gluten, albumen and casein, and they contain about 15 per cent. of nitrogen, which is always found, in about the same proportion, in the muscles, the blood, the skin and the hair. And besides nitrogen, albuminoids contain carbon, oxygen and hydrogen, or carbon and water. The carbohydrates contain no nitrogen—only carbon and water. These are starch, sugar, gum, cellulose and fat. All these substances must be present in food to sustain animal life. In examining the table the reader will see that these foods contain albuminoids and carbohydrates in very unlike proportions. The nutritive ratio shows, at a glance, the relative proportions of these substances.

The Germans have been experimenting for some years in determining the relative proportions of albuminoids and carbohydrates required for animals of different ages and kept for different purposes. The following table is translated and published in the report of the Commercial Experiment Station:

FEEDING STANDARDS.

Per day per 1,000 pounds live weight.

	Total Organic Dry substance.	Nutritive Digestible Substances. Albumi-	Carbo-hydrates.	Fat.	Nutritive Ratio
	lbs.	lbs.	lbs.	lbs.	lbs.
1. Oxen at rest in stall	17.5	0.7	8.9	0.15	1:12
2. " moderately worked	24.0	1.6	11.3	0.30	1:7.5
3. " heavily "	26.0	2.4	13.2	0.50	1:6.0
4. " fattening 1st period	27.0	2.5	15.0	0.50	1:6.5
" " 2d "	26.0	3.0	14.8	0.70	1:5.5
" " 3d "	25.0	2.7	14.8	0.60	1:6.0
5. Cows in milk	24.0	2.5	12.5	0.40	1:5.4
6. Growing cattle:					
Age. Av. Live Weight....					
month. per head.					
2—3 150 lbs.	22.0	4.0	13.8	2.0	1:4.7
3—6 300 "	23.4	3.5	13.5	1.0	1:5.0
6—12 500 "	24.0	2.5	13.5	0.6	1:6.0
12—18 700 "	21.0	2.0	13.0	0.4	1:7.0
18—24 850 "	24.0	1.6	12.0	0.3	1:8.0

Dr. Wolff illustrates the standard ration for milch cows by saying that 30 pounds of young clover hay will keep a cow in good milk, and this contains of dry organic matter 30 pounds, of which the following are digestible: albuminoids, 3.21, carbohydrates, 11.28, and fat, 0.63 pounds. This is an excess of albuminoids, a slight deficiency of carbohydrates and an excess of fat. Then he takes 30 pounds of the best meadow-hay, which contains of dry organic substance, 23.2 pounds, having digestible albuminoids 3.49 pounds carbohydrates, 12.78 pounds, and fat 0.42 pounds. This is very close to his feeding standard.

I wish my readers would carefully study these tables, and get well fixed in the mind the qualities of the different foods. Chemistry has done much for agriculture; but in no department has it done more than in revealing to us the quality of foods. Chemistry is able to give us precise information concerning the elements of animal bodies, showing how the latter meet exactly the wants of the former. The waste products given in the table are, of course, not normal rations, in themselves, possessing some elements in excess, and being deficient in others, but when the feeder understands the composition of his foods, his skill is shown in combing them so as to give completeness to all the elements. In order to give any thing like a complete discussion of winter-feeding and the methods of preparing foods, it will be necessary to treat of that stale topic,

Cooking Winter Food.

This topic is stale because it serves always to bring out no end of contradictory opinions—those of its advocates and opponents alike apparently based upon experiments. And it is unfortunate that experiments have not been careful and long-continued enough to settle the question beyond cavil. If we look at the matter from a philosophical point of view, we shall find the arguments very strong for cooking the food of animals. Heat certainly has a decided effect upon the digestibility of food. Starch composes from 40 to 65 per cent. of our cereal grains. And if you take starch that has been separated from other elements of wheat or corn, and mix this with water at a temperature of 100 degrees, or expose it to the heat of the animal stomach, it will not dissolve, as it requires the heat of 162 to 212 degrees to dissolve it completely. Every housewife knows that she must mix her starch with boiling water to dissolve it. If we cook one bushel of corn meal thoroughly, it becomes two bushels or more in bulk—the grains of starch having

burst and become soluble in water. This is the effect of cooking upon grain.

Woody fiber, or cellulose, is still more difficult of digestion. Let us take an extreme case: take the woody fiber of the trunk of a tree. That is supposed to be quite indigestible, but if we take the saw-dust from hard wood, say sugar maple, still better box-wood, place it in an oven, thoroughly dry or bake it at a temperature of about 300 degrees (do not burn it), then grind it fine in a coffee mill, the resultant flour will now partially dissolve in hot water, and by the addition of yeast will rise like wheat dough. Under the power of heat it becomes soluble and digestible. Tomlinson says the people of Norway and Sweden, in case of scarcity of food, have sometimes used saw-dust, thus prepared, for bread. I could refer to a half dozen authorities upon these facts, but only mention them to show the effect of heat upon the digestibility of grain and the woody fiber of hay, straw, etc. It appears, then, that cooking cattle food ought to render it more digestible and therefore more valuable.

The writer, many years ago, from extended experiments, became well convinced of the value of cooking food for all farm animals. But there is a great deal that goes under the name of cooking cattle food, that is merely a delusion—wetting with hot water; never raising the temperature even to the boiling point, much less continuing the heat long enough to thoroughly cook the food. Yet all these are called experiments in cooking, when they are only experiments in warming and fermenting food. That only can be called cooking food, which boils or steams it till reduced to a pulp. The writer has proved by careful experiments that cooking renders 25 to 30 per cent. more of the food in grain and straw digestible. Early-cut and nicely-cured hay is not improved more than 5 to 10 per cent. and therefore it does not pay to cook it. I have not room to detail experiments in this paper. But if it be admitted that food is increased in value 25 per cent. by cooking, it does not follow that cooking must always be profitable. It is a simple question whether the cost of cooking will be less than the gain.

And right here is where mistakes are often made. It costs nearly as much to cook the food for five to ten animals as for 30 to 50, provided you have an apparatus capable of cooking for the larger number. I say then, to start with, that you cannot afford to cook the food for a few animals, unless you have the leisure to do it yourself. The cost of the labor will be greater than the profit. Then, one of the greatest discouragements to successful cooking has been the multitude of small apparatus invented and put on the market for this purpose. Farmers are not supposed to be engineers, and they do not understand the advantage of a large fire-surface in producing steam. Most of these small boilers, which are recommended for cooking for 20 to 30 head of cattle, have only six to ten square feet of fire-surface. Ten square feet of fire-surface, in a boiler, is reckoned equal to one horse power. Now, a five-horse boiler, having 50 square feet of fire surface, would produce five times as much steam with about the same fuel as a one-horse boiler. These small boilers are totally inadequate to the work they are expected to do.

Again, in cooking food economically, there should be ample power to cut the hay, straw or fodder corn, with a carrier to deliver the cut feed in the steam box, also with a power mixer to mix the cut fodder with the grain and water (for all food must be moistened before it can be steamed), doing nearly all the labor by machinery. When properly arranged, one man may do all the labor of cooking for, and feeding 100 head of cattle. Those waste products, given in the above table, may be used most profitably under the cooking system in making up fattening rations with straw and other coarse fodder.

STOCK BREEDING NOTES.

RICHARD GOODMAN.

[HAVING been in the habit for twenty years past of entering into my note book memoranda of the best ideas of others and the results of my own practice in breeding fine dairy stock, I reproduce some of the most useful of these notes as a guide to beginners in the business of breeding.]

MILKERS—To develop milking properties or to perpetuate them, breed with bulls descended from milking families. Keep the cows constantly in milk for from nine to ten months, giving plenty of good stimulating and milk-producing food, summer and winter. Heifers must come in young—my Jerseys do at two years—and be kept in milk ten months with their first calf, that the milking organization may be kept in full play for as long a period as possible.

SERVICE OF COWS.—It may not be possible to force nature into any particular channel, but the experience of breeders has settled upon the practice of taking advantage of the *first period* of the cow's heat—not always the first coming in heat—to insure the getting of a heifer. It is noted that when a bull runs with the herd, there are more heifers than of the other sex, owing to the copulation at the *earliest moment of the heat*. Cows should not, as a general rule, be served the first time they come round after calving, but be put off until they are again in season, as they are more likely to stand the service and less likely to be injured. After service tie or shut up the cow and do not let her mix with the herd for twenty-four hours.

CALVES.—After the calf has been with the dam a couple of days, if there is no sign of garget in the bag of the latter, teach it to feed from the pail and to be led familiarly with the halter. If the dam's bag is hard and will not yield to the hand-rubbing, let the calf in to suck and bunt three times a day until the hardness is removed, stripping the teats well after each nursing.

BULL CALVES reared at the pail, at a year old will show a finer head and dewlap than if allowed to nurse, as in the latter performance they are obliged to hold their heads down and necks stretched out so as to occasion too much loose skin. They should have good milk every day until turned to grass, and at a year old have a ring in the nose. A calf of either sex will take, from the first to the third week, four to six quarts of milk daily; from the third to the sixth week, six to eight quarts; from the sixth to the eigth week, 10 to 12 quarts. Keep before them in a little box which they cannot tread in, some wheat bran and give them access to a little fine hay after they are a month old. A mixture of wheat bran, ground oats and oil meal, allowing a couple of quarts a day to each calf, is excellent food for the youngsters as they grow, and will assist in weaning them from the milk when that is needed for other purposes, or keep them in condition when skimmed milk is substituted for fresh, as it is on most dairy farms after three or four weeks. No matter how fine the breed is, the calf must be raised on rich, nourishing food to develop its milking qualities as well as its growth, and an animal stinted during its first year in its natural food, seldom recovers. Cleanliness is of the first importance and freedom from vermin. I see now before me a cow of the best pedigree and the richest of milkers, which has never developed in size and form and has remained weak and poor because whilst a growing heifer, she was neglected, and the lice and dirt allowed by a careless stableman to overrun her. Salt in a small quantity once a day is better for all the animals than large quantities less often, and a little sulphur mixed with it—say one-half to three-quarters of a pound to each cow during the winter—will do them good, and sulphur well rubbed through the hair will keep off the lice from cleanly herds when the cows are well fed, bedded and carded.

BEFORE CALVING.—Heifers fed for three months before calving with a little oil meal *in addition* to their other fodder, acquire, it is said, a larger development of the milk vessels and yield more milk afterwards than if fed as usual. The general practice among farmers and some breeders is to feed high up to the moment of calving, but I have found this a dangerous practice with *Jerseys*, having lost several fine cows in too good condition, from puerperal fever, and I consider it safest to withdraw, at least two weeks before the parturition, all food except hay, and a little oats or roots.

BREEDING FOR THE BEST RESULTS.—The best females should be used as well as the best males, and especially in the case of in-and-in breeding, which is only allowable in case no other sires of equal excellence are to be had and the breeder is striving to attain certain uniformity of excellence. The best male, in reference to the particular case, may not be the best animal of the stock from which it is desired to purchase, because he should pre-eminently possess points which will either improve or sustain those of the females which he is to serve. The properties which a male should possess are relative, not absolute—for absolutely good points should be possessed by the female. The least defect in the female, from accident or inherent weakness, should be the instant signal for her removal from the herd.

THE AIM OF THE BREEDER is that the stock shall possess fine symmetry—shape, as it is commonly called—robust constitution, a disposition to attain early maturity, which insures good quality of flesh, and, in milch cows, deep-milking qualities.

SELECTION OF BULL.—He should be of moderate size, coupled with as much fineness of bone and limb as is consistent with vigor and energy, together with fullness of carcass and ripeness of points. In addition to these, let him be of as *pure blood and of as long ancestry as possible, and for the dairy, of the best milk or butter stock.*

Tokun Farm, Lenox, Mass.

MEAT OR FAT?—There is a general agitation in the live stock papers looking to the production of beeves, sheep and hogs yielding a fine quality of marbled meat rather than huge masses of indigestible fat. The present tendency of fat-stock shows is decidedly favorable to the rearing of animals of less service to the table than to the lard-rendering industry.

Dairy Husbandry.

CENTRIFUGAL CREAMING.

At the late Dairy Fair there were on exhibition two machines for separating the cream from milk by centrifugal force. Only one was in operation, and it did such good work that the Messrs. Whitman and Burrell took it home with them to try it in actual work in the dairy.

The president of the International Dairy Fair, Mr. F. B. Thurber, furnished me the following statement of a trial of one of these machines at the dairy fair in England, at which he was in attendance last summer:—

"Memorandum of results obtained in a competitive trial between the Laval Cream Separator and setting milk in pans, at the Dairy Show of the British Dairy Farm Association, London, October, 1879:—

"Sixty gallons of milk were divided into two equal portions of 30 gallons each. One portion was placed in the separator, and the product churned at a temperature of 56 degrees, yielded 16 pounds 7 ounces of butter; the other portion was set in pans 12 hours, and then skimmed; left another 12 hours and skimmed again; the product was then churned at 56 degrees, and yielded 18 pounds 13 ounces of butter.

"The skimmed milk by both processes was then set in pans 24 hours; that from the separator yielded 17 ounces additional cream; that from the ordinary method of setting yielded 38 ounces additional cream. To complete the test a bottle of each skimmed milk was taken by Dr. Voeleker, Consulting Chemist of the Royal Agricultural Society, to ascertain what amount of fatty matter still existed in the skimmed milk; this result had not been completed or announced when I left."

While the above statement makes out a case in favor of shallow setting, yet, if the figures be true, I will venture the prediction that in less than three years centrifugal cream separators will be as common in farm-houses as sewing machines now are. To my notion, however, there is some mistake in the make-up of this statement. Just to think of it: the shallow pans and the machine required but about fifteen and sixteen pounds of milk each to make a pound of butter, and they probably used city milk, which every one is willing to swear is at least one-third water from the pump. And then there was much cream left by both processes, as afterwards proven. The closest work I ever did with milk was in a competitive trial between deep, cold and shallow setting, in Chautauqua county. There we used native cow's milk. The former method required 21.51-100 pounds and the latter 21.53-100 pounds of milk to one of butter, and nothing but a chemical analysis of that skimmed milk would ever have found a particle of cream.

In my opinion, whoever gave Mr. Thurber that statement made the mistake of dividing those 60 gallons of milk between them instead of giving each process 60 gallons. From my practical knowledge of cream separating I am quite positive that, considering the quality of milk probably handled and the amount of cream left in the skimmed milk, the two processes required just about double the amount of milk to make a pound of butter that this statement credits them with having used. I hope the English exchanges of the RURAL NEW-YORKER will correct this statement, if in making it I am mistaken. L. S. HARDIN.

STRAINING MILK.

I have seen at dairy fairs many devices for straining milk—one with a pyramid of very finely woven wire in the center of the strainer rising about three inches above the bottom. The theory upon which this is expected to work is that the milk pouring upon the apex of the pyramid, would wash the sides so that the milk could pass through. This same principle was in another invention applied more simply by inserting the same wire gauge over holes in the sides of the old-fashioned circular strainers.

The great trouble with all these wire strainers is, that if they are fine enough to stop cow hairs from passing through, they are then so very fine that the thick portions of rich milk soon clog the whole strainer up and create great delay in straining the milk at the stable. Every practical dairyman knows what harm it does cows for the milkmen to take a long time in finishing them up. There should be no stopping from the time the first cow is touched until the whole herd is finished, and it should all be done in as short a time as is consistent with clean, thorough milking. Men should not be allowed, much less required, to delay at the receiving can. Wire strainers, if fine enough to be of any real service, are sure to do this.

The best plan is to have a strainer large enough to hold a full bucket of milk, placed upon the receiving can. This strainer should have one thickness of linen and one of cotton cloth on it, the former above the latter. In this way and this way only can milk be properly and expeditiously strained at the stable. With this plan the man when through with a cow, walks to the receiving can, pours in his bucket of milk and passes on to the next cow. The bottom of the large strainer should be as large as the receiving can will admit. L. S. H.

A MOVEMENT LOOKING TO BETTER PRICES FOR MILK.

A meeting of the milk-producers of Orange, Sullivan and Sussex counties, N. Y., was held at Middletown, on the 6th inst., to form an organization for mutual protection, and to obtain better prices for milk. More than 250 delegates attended, representing most of the important stations in the three counties. Reports from the various stations show that farmers generally would be glad to accept two, three and four cents a quart respectively for each four months of the year, while some preferred two and one-half and three and one-half cents for each six months. Many of the reports state that the farmers are willing to bind themselves not to sell for less than two, three and four cents. No action was taken on the reports, as it was determined that the first business should be to form an organization. The following committee to draft a plan for an organization was appointed: For the Erie Road and its Branches—Henry M. Howell, of Middletown; Joseph W. Youngs, of Oxford; J. E. Wells, of Chester, and Charles F. Johnston, of Goshen. For the New Jersey Midland—J. W. McCoy, of Deckertown, N. J., and G. W. Cook, of Slate Hill, Orange County. For the New York Midland—James D. Gray, of Parksville, Sullivan County. For the Sussex Railroad—Samuel Warbassa, of Branchville, N. J. The committee will meet at Middletown on Jan. 13th, and report to a mass-meeting of the farmers of the three counties to be held there on Jan. 20.

The members of the committee are nearly all in favor of selling all the milk on the platform at Jersey City, from day to day, for cash and for what it will bring, and will probably recommend an organization looking toward this as an ultimate result. This would prevent heavy losses on milk bills by reason of irresponsible dealers, and would save large losses of cans as well as collectors' fees. The committee thinks some intermediate plan must be adopted to improve the present condition of the business and to encourage timid farmers to risk the more radical change of daily platform sales.

Most of the farmers in the three counties are receiving only three cents for winter milk. The feed to produce this costs nearly all they get for the milk, and little is left for income on capital, depreciation of stock and the labor involved. Association creameries are being built or projected at different points along the Erie road, to work up the surplus milk into cheese or butter.

FEEDING COWS FOR BUTTER.—As regards the proper feed for cows so as to make them give milk that will produce butter with a good, rich color, I must differ from a late correspondent of the RURAL. He says that corn-stalks produce butter of a very white color. Now since I commenced stabling my cows—about the middle of October—I have given them corn-stalks twice a day, mornings and nights; at noon I feed them a little wheat straw, which I use as bedding after they have picked it over; yet my butter has a very rich color. Give me plenty of corn-stalks, oats and ground corn—three of oats to one of corn—a little bright hay—clover, timothy or quack (quack I prefer if cut and cured properly)—and if your correspondent can beat the color of my butter he will have to mention a different kind of feed to do it with. To make butter come quickly, I have never either seen or heard of anything better than ground oats as a feed for the cows. Never before has butter come so soon with us as during the past two winters, during one of which we fed the cows with ground, and during the other with unground oats. T. A. D.

Kirkville, N. Y.

The Poultry Yard.

ARTIFICIAL INCUBATION.

HENRY HALES.

Nature is generally slow and sure in her methods of reprodnction; man tries to be a little faster. He has domesticated poultry, and by care, selection and good feeding, he has brought hens to lay more eggs than they can possibly hatch themselves, furnishing him with a supply of food not to be excelled. But sometimes chickens are wanted more than eggs, and man's ingenuity has been taxed to find out how to turn those eggs into chicks without the aid of that fickle, fussy bundle of flesh and feathers called a sitting hen. The problem is not a new one—it is as old as the pyramids themselves; but the Egyptians had a climate that did half the work. With us the qnestion is how to hatch and rear chicks at a time when the climate is very trying—early spring—so that chicks hatched at that time are nearly ready for the gridiron by the time others are beginning to pipe under their natnral mothers, or so that, if intended for show birds, they may be well developed in the following fall.

In comparing the advantages between natural and artificial incubation we must take into consideration the preparation, time and cost of each. In the former there is the cost of sitting hens, feeding them, the place they occupy, and the labor in caring for them during the period of incubation. Those who have had any experience in the latter performance know well the patience required for regulating their unruly, capricious perversities; for of all things domesticated, nothing is more provoking than an intractable sitting hen, shifting from one nest to another, staying off too long, or, if you shut her down, when yon peep in you will find her as the Dutchman did, sitting "standing up." Who in looking after the sitters, has not experienced that "olfactory" treat of cleaning a fouled nest of broken eggs, generally caused by the blundering sitting hen? There is certainly no reason why vermin should be there, for a little care will prevent that, but it all takes *time*. After the hen has brought off her brood, in all natural history there is no more interesting sight, *if* she happens to be a good, sensible mother; but too many prove to be otherwise. Her very zeal endangers her offsprings as she dashes at every supposed enemy, or perhaps (which is very common), she drabbles her little ones through all kinds of weather, early and late, over wet grass or under a scorching sun; or, if cooped up, she keeps up such a continual scratching and jumping as to destroy the objects of her solicitude.

Then there is the calculation which only experience can decide as to the gain or loss in the health of chicks as raised naturally or artificially. Some assert that the latter escape the constitutional weakness and parasitic tendency of the hen, owing to the improved, warmed, artificial mothers. This may be true, but certainly not unless great care is given to the warming, cleansing, etc. Many evils are certainly avoided with the new mothers, but with delicate breeds, or, I should say, with all except the hardy Asiatics, the natural warmth of the mother is a great desideratum.

In deciding about the use of incubators, the first considerations are:—the outlay for machine and artificial mothers; the space occupied by them; the outlay of oil for warming and of time in attending them; the percentage of chickens raised at a given price, at a certain time when the services of mothers would be dispensed with; and the sound, healthy constitution of the offsprings. Upon the results of these considerations will depend the relative advantage of natural and artificial hatching.

"GOOD LUCK" IN POULTRY KEEPING.

"You've had prime good luck with your chickens, ha'n't ye?" I was so busy cleaning my hen house that I hardly noticed the coming of the neighbor from whom the voice came. Now, I looked up. "Yes," I said, "first-rate luck; raised every chick that left the shell." "Wall," he replied, "that's jest the way, some folks always do seem to have luck, but I never did. Hens lay any?" "Yes," I replied, "my pullets are laying from four to six eggs a day." "Only see!" he said, "I must have your breed of fowls." "All right," I replied, "but you must also get a comfortable place for your hens, and give them the same care and management that mine get, and then I think your hens will lay as well."

As he walked away I fell to cleaning the room again, and to thinking wherein my "luck" consisted. In the first place, I had the "good luck" to have clean, comfortable coops for my chickens; second, I had the "good luck" to see to it that they were fed regularly with corn-meal buckwheat and oats and corn ground together; and, thirdly, I had the "good luck" to furnish them with clean, pure water, and safe quarters for the night, secure from prowling skunks or marauding rats. The fact is that most of the "good luck" in chicken raising is simply the result of good management and careful, persistent industry. JOHN H. SEVERSON.

Albany Co., N. Y.

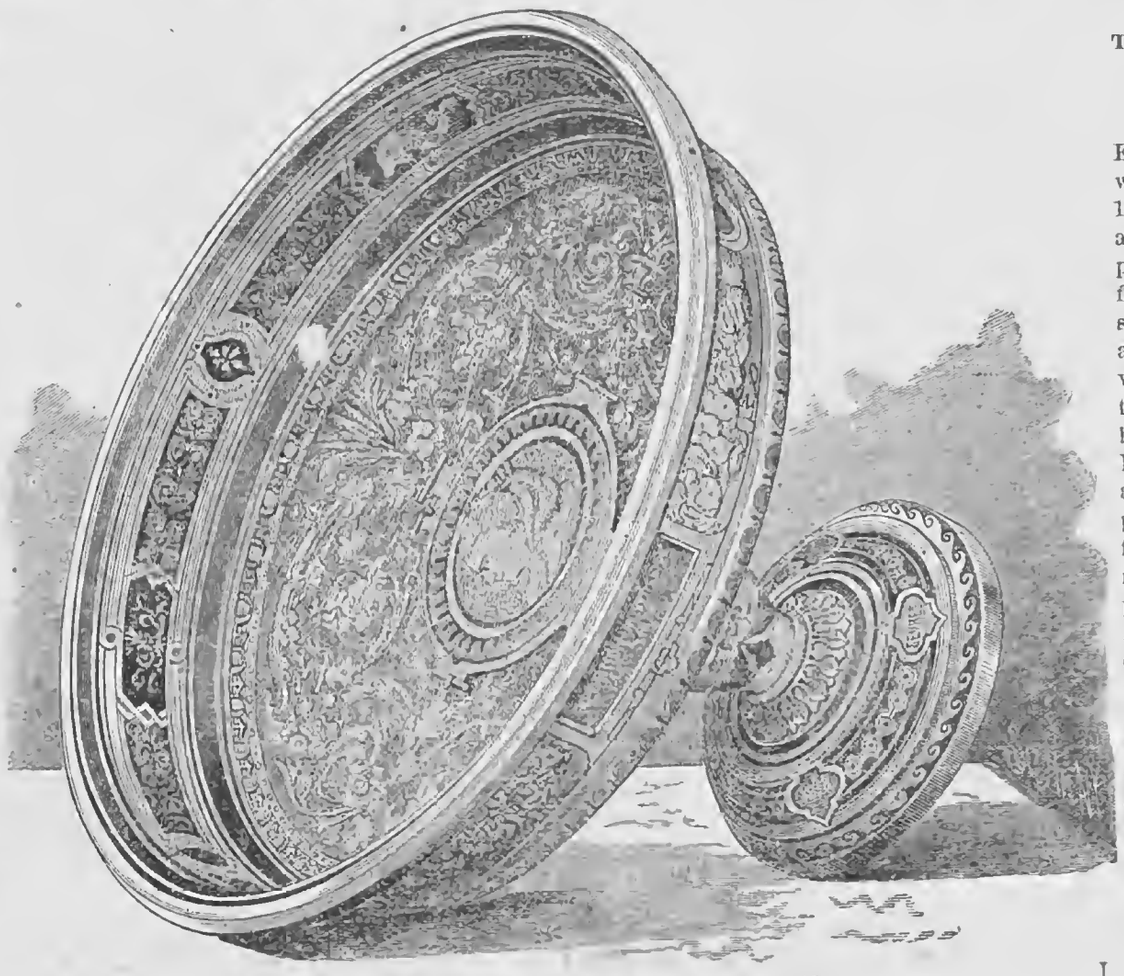
The Apiarian.

INTRODUCTION OF CYPRIAN BEES.

There has been much curiosity manifested of late as to the value of Cyprian bees for our American apiaries. The Italian bee, it is true, has met with universal favor, and by general consent has been pronounced superior to any other known race. But it is not in the nature of American bee-keepers to let well enough alone. They must be progressing. With true Yankee spirit they are ever on the look-ont for something better, forever experimenting, perfecting, investigating. And a very commendable spirit it is. It is this characteristic that has already led them to produce the best hives, the best extractors, the best smokers, and the best bee-literature in the world, and still the cry is onward. Cyprian bees are said to be on trial in one or two apiaries in the country already, but there is a shadow of doubt as to their purity, and to pronounce upon their value as compared with the Italians might therefore be premature.

There are now good prospects, however, that this question will soon be settled. Mr. D. A. Jones, the noted bee-keeper of Beeton, Ontario, and Mr. Frank Benton, a recent graduate of Michigan Agricultural College, are about to embark for Cyprus, where, after having made themselves acquainted with the people, surrounding circumstances, etc., they intend to locate an apiary and breed bees for exportation to this country. Mr. Benton is to have charge of the apiary in Cyprus, and send the bees to Mr. Jones, who, in order to keep them pure, will continue their propagation on an island in Lake Huron, several miles from shore, where there is no possibility of their mixing with any other bees. This plan seems to be the only one whereby bees can be imported direct from Cyprus, as the good folk of that island refuse to sell their bees to strangers; they have a superstition that it is unfortunate to do so. If a few colonies of Cyprians were first to be brought to some place in Italy or Germany, and then bred for further exportation to this country, grave doubts of their purity might well be entertained. To the casual observer there is but little difference in appearance between Cyprian and Italian bees, but on turning them over, the Cyprians are found to be bright yellow on the under side of the body, which the Italians are not. Professor A. J. Cook, of Michigan, has also made some careful measurements of the tongues of the two races, and at a recent visit to this office the Professor stated that he had found a remarkable uniformity in the length of the tongues of Italians, all measuring 25 hundredths of an inch, while the tongues of Cyprian bees varied greatly, some measuring 26 hundredths and others only 24 hundredths of an inch. This circumstance led him to doubt that the bees were perfectly pure.

We hope that this effort to introduce Cyprian bees may not only prove a success to those who undertake it, but that the bees may prove a valuable acquisition to the rapidly expanding business of honey production.



JOHNSTON HARVESTER CO'S. PRIZE VASE.—FIG. 13.

Various.

CATALOGUES, ETC., RECEIVED.

THE Flowers and Ferns of the United States, by Thomas Meehan. Published by the American Natural History Publishing Co., Philadelphia, Penn.

We are now in receipt of parts 9, 10, 11, and 12 of Volume 1st, second series, and they strike us as even of more interest than any of their predecessors. It should be borne in mind that though each part is one of a comprehensive work, each part is in itself complete. We have no reason to suppose that the work is not meeting with an appreciation alike gratifying to its well-known editor and the publishers. We should be sorry if this were not so, because the work in all respects is one that should forcibly commend itself to every lover of the wild plants of our country. It is a work of great beauty—the botany is trustworthy; the colored plates are drawn from nature with remarkable accuracy, and the descriptions are written in an easy, plain manner that renders them interesting to the beginner as well as to the skillful botanist. Our words of praise are positive and we mean them so to be. There is not one of our readers who purchases this work that will ever reproach us for having so influenced him. The price is extremely low. Indeed it is this alone which makes us solicitous lest it may not meet with the extensive patronage which alone can secure its continued publication from year to year until the most important plants of our country shall have been drawn and described. Address all questions to the publishers who will answer promptly.

W. B. JONES, Herndon, Ga., Price-list of field and garden seeds. Besides many sorts of seeds adapted exclusively to a Southern climate, we notice seeds of Pearl (Cat-Ta'l) Millet offered (cleaned) at 15 cents per pound by the bushel; also Minnesota Early Amber cane seed—Dourra, &c. The Dourra, however, is not the variety of which we wrote a few weeks since, as we judge from the description. Price-list free to applicants.

WE have received a prospectus of the American Entomologist, a monthly to be edited by Chas. V. Riley assisted by A. S. Fuller. Professor Riley is competent to make this work of great service to all who are interested in Entomology. All business letters to be addressed to the publisher, Max Jaegerhuber, 323 Pearl St., New York city. Sample copies 20 cents—$2.00 per year.

PLANT SEED COMPANY, 812 and 814 North Fourth St., St. Louis, Mo. A large catalogue of 32 pages. Early Amber cane, all sorts of field seeds and roots—spring wheats, Clawson, Fultz, Red May, Diehl, fall wheats—Blount's White Prolific corn; flower and vegetable seeds generally. Sent free to applicants.

REPORT of the Commissioner of Fish and Fisheries for the year 1877. This volume of 981 pages is a valuable mine of information with regard to all questions relating to the finny tribes as food for the human family.

The Special Prize for Harvesters at the Paris Exposition of 1878.

AT every international Exposition held in Europe, American agricultural machinery has won high distinction, but at that of Paris in 1878, it achieved an overwhelming victory over all competitors. In no department was this superiority more manifest than in that of practical field trials, for exceptional merit in which twelve special prizes in the shape of twelve objects of art—Sèvres vases—were offered. Of these seven were won by Americans, one by a French exhibitor of an American machine, two by French exhibitors of home-made machines, one by an English exhibitor, and the twelfth was not awarded, as no sufficiently meritorious competitor appeared for it. Although it is doubtful whether any field trial excelled that of reapers in importance, only one of the dozen prizes was offered for that class of machines. As thirty-five of the best reapers in the world contended for this, the honor of bearing it away was all the more distinguished. This honor fell to the lot of the Johnston Harvester Company, of Brockton, N. Y., who have lately received the splendid prize represented in the accompanying engraving.

The vase is of tazza form, ten inches high, the bowl being three inches deep and fourteen and a half inches wide across the top. The prevailing color outside is blue and gold; inside are panels of scroll work, tritons and trefoils, with a circular band in gold. The center is ornamented by a raised medallion emblematic of the city of Paris—a female head with a battlemented mural crown. The medallion is encircled with scrolls, rosettes, fruits, wheat ears and other agricultural symbols. Outside around the body of the vase is a wreath of flowers, fruits and grain, with a spiral pink band bearing the legend "Exposition Universelle, Paris, 1878." The pillar is blue and gold highly ornamented. Four panels in a circular band on the foot contain respectively the words "Sèvres," "Paris," "Exposition," "1878."

The money value of this unique work is about 1000 francs, but this is a mere nothing as compared to its worth as a lasting testimonial of the practical excellence of the machine that won it from so many able rivals in a contest to which the attention of the agricultural world was directed.

American Butter Color at the London Dairy Show.

It was my honor and pleasure, as steward of butter and cheese implements, to have charge of the collection of American utensils exhibited at our late show in London, in conjunction with my friend Prof. J. P. Sheldon.

I must thank Wells, Richardson & Co. for the liberal gift of samples of their Perfected Butter Color which I have spread over a great area for trial—some going to South America, a sample to Russia, another to Norway, etc. I brought to my home some small and large bottles giving the former to friends who are thoroughly in love with it. I have always objected to ordinary annatto preparations, because they give an unnatural reddish tint, whereas properly colored butter, however large the amount of color used, should be a clear yellow. The nearer we can approach the color of Australian or pale gold, the more natural is the color and the better pleased is the consumer. Our people demand color, but they do not like unnatural tints.

Now, so far as I can judge by a few practical experiments, I have never met with any color equal to the Perfected Butter Color and I congratulate Wells, Richardson & Co. upon their success in its production. I believe there is a good opening for it in England, and that it may be got into use in Denmark, Sweden, Norway, Germany, and France where, as doubtless you know, they have an immense trade in butter. JOHN OLIVE.

London, Eng.

Everywhere.

RURAL SPECIAL REPORTS.

KENTUCKY, Milton, Trimble Co., Jan. 3.—The RURAL has repeatedly expressed the opinion that the price of potatoes would rule low the present season. But the light crop in Kentucky, Indiana and Ohio induced me to believe the RURAL would be mistaken; and I refused 40 cents per bushel early in the season. But now, after paying 10 cents per bushel for cooperage, five cents per bushel for freight and 10 cents per bushel for drayage, storage and commission, I would gladly accept 50 cents per bushel. In other words, had I taken the RURAL'S advice, I would have been at least 15 cents per bushel better off to-day than I am. I am now holding my hogs upon the strength of the RURAL'S statement that the present depression in the price of hogs would be only temporary. We shall see. The thermometer went down to 15° above zero on Christmas Day, which was the coldest day of the season, so far. We have had but one snow, and that was barely enough to make a white instead of a green Christmas. S. E. H.

NORTH CAROLINA, Raleigh, January 6.—I have been quite familiar with "Cat Tail," or, as the RURAL calls it, "Pearl Millet," for the past twenty years, and can bear testimony to its value as a green food for cattle, and especially for milch cows. In these parts we have not used it as a dry food to any extent. I was quite successful with it the past summer, cutting it four times, and I think in an ordinary summer it might have been cut six times. We suffered from an excessively dry season, and hence the crop fell short. I should not hesitate to recommend it in this part of North Carolina, and think it will do better south of this; indeed I have seen it made profitable south, and if I am not in error, our first seed was brought to North Carolina from Charleston, S. C. I think the Doura, which by some is called Pearl Millet, would prove a valuable crop; but the birds play havoc with the seed, as they do with Cat Tail Millet seed, and a planter must purchase his seed every year or keep a "darkey" with musket and small shot to shoot or scare the birds away.

I read the Tea Plant article that lately appeared in the RURAL, with some interest, especially as I know a gentleman in this State who has for the past twenty years raised his own tea, and that of a fine quality, from seed planted by himself. The seed was sent out from the Department of Agriculture some twenty or twenty-five years ago.

I am glad to see Prof. Ledoux writes for the RURAL. I am one who thinks that our "Experiment Station" is a long step ahead for North Carolina, and sincerely believe we are already feeling its good effects. Your specimen of Cow Pea would do credit to us who raise them in perfection. The pea vine forage is equal to the best hay, if the vine is cut when the pod is just formed. It is, however, harder to cure than any other forage; but it pays for the trouble.

If your seedsmen who have "Pearl Millet," "Doura," or "Teosinte" seed for sale would advertise, we would know where to buy. I desire to try some of each to test them, but do not know where to find the seed. P.

N. Y., Crumb Hill, Madison Co., Jan. 6. Corn was about half a crop here; oats were good; potatoes fine both in quantity and quality; fruit light and it rots in the cellars badly. We have had a large quantity of snow, but little remains now. It was a good fall for fall work of all kinds. L. P. N.

OHIO, Mt. Vernon, Knox Co., Jan. 3.—We have had very cold weather here this winter, the thermometer standing a good part of the time at from 5° to 8° below zero. The winds have been very cold; the trees are covered with ice from sleet; but there is very little snow. The prospects for ice are so far poor, as the waters are high and ice cannot form. I have mulched my winter spinach with bean vines which I find to be the best covering. They are not too warm or close, catch what snow there is and can be easily removed. Potatoes are still very low; No. 1 stock 30c. per bushel. Corn is King here this season, bringing 50c. at the crib by the 100 bushels. Wheat sells at $1.25; oats, 30c.; beans, $1.40; onions, $1.75 and scarce at that. Real estate is on the rise, and that is a good sign. Good farms cannot be had here close to the town, under $100 per acre. Our farmers are beginning to be alive to the advantages of tile drains. M. W.

OHIO, Hillsboro, Highland Co., January 8. We have had an open winter thus far. There have been a few cold snaps only last week, the severest being when the mercury stood 6 degrees above zero; to-day it stands at 54 degrees, and we are having plenty of rain. The mud-roads are in a worse condition than they have been for three years. Corn was less than an average crop and is now worth 40 cents. Early potatoes were a short crop; worth 50c. Peachblows were a good crop, worth 20@25c. Oats were good, worth 30c. per bushel; wheat, $1.05; hay, $10.00 per ton. I don't think very much of the Pearl Millet; our season is not half long enough; of the Blount's corn we had about three-quarters of a bushel of ears—about the size of our common pop-corn, and stalks about 14 feet high. The Beauty of Hebron potatoes did well, considering the hot and dry weather we had when they were setting. J. & B.

O., Jerry City, Wood Co., Jan. 4. So far we have had a mild winter, with only two or three cold days, and but little snow. Wheat was injured considerably in the fall by dry weather and the fly. Pieces that escaped injury look splendid and have not been damaged by freezing as yet. A large acreage was sown, of which a small percentage will probably be plowed up in the spring for oats or corn. All kinds of stock are looking well, but should the winter prove a long one, rough, feed will be scarce except straw. There is a fair amount of grain in the country for this time of the year. We have a large quantity of fine timber principally Cottonwood, Sycamore, Oak, Elm and Ash. There are four stave factories in the county, that manufacture millions of staves every year. Money is "tolerably" abundant; prices for stock and produce "tolerably" good. Good work-horses are worth from $75 to $125; milch cows, $25; fat hogs, $1 per 100 lbs; cattle, $3; chickens, 4 cents per pound; turkeys, 5 cents; butter, 18 cents; eggs, 18 cents; wheat, $1.25; corn, 43 cents; oats, 30 cents; land $40 to $50 per acre. H. W.

PA., Poughtown, Chester Co., Jan. 5.—The weather was very fine here the past fall, so that a great deal of out-door work was done. Lately we had a good deal of rain so there is plenty of water in the rivers and springs. D. H.

VIRGINIA, New Market, Shenandoah Co., Jan., 4.—Times are better here than they have been for some time; this is owing to better prices for produce and a better prospect, for wheat etc., for next harvest. This is a grain-growing section. Wheat is just recovering from the long drought we had here. Some wheat has not come up yet. We did not have rain enough to settle the ground from the 15th of Sept. until the 6th of Dec. Since then showers have been seasonable, and grass and wheat have grown a great deal. We had very little rain from the time the corn was planted until it was matured, and consequently wells and springs in some parts of the country dried up. We did not have an average wheat crop, and not more than two-thirds of a corn crop: other grains in proportion. Plenty of garden truck. Farmers here feed their surplus corn mostly to cattle and hogs, and ship very little; freights are high here. Prices are:—beeves, 3½c. to 4½c. per pound; hogs, 3½ to 3¾c; chickens, live, 5c. to 6c; ducks, 20 to 25c. each; turkeys, 7 to 8c. lb gross; wheat, $1.35 to $1.37; corn, 50 to 53c; rye, 60 to 70c; oats, 40 to 42c; bacon, 7 to 9c. per lb; butter, 20c; eggs, 20c; lard, 5½ to 6c; clover-seed, 8 to 8½c; onions $1.00 to $1.25; flax-seed, $1.00 to $1.25; beans, white $1 80 to $1.90; mixed 75c. to $1.00; apples, 40 to 45c. We have had very little cold weather yet, just a slight skim of snow and sleet together a few weeks ago. We had a pretty heavy lot of icicles on the night of the 13th of Dec; they broke down a good many trees and tree-tops etc., but by evening of the 14th, nearly all the ice had disappeared. The coldest weather we had this winter was four deg. above zero. Corn is mostly husked and cribbed and the fodder is nearly all gathered. People predict a mild winter. We have good pasture yet. P. S. W.

The Querist.

ANSWERS TO CORRESPONDENTS.

Coarse or Fine Feed.

D. A. H., of Memno, Pa., asks the relative effect and value of coarse, medium and finely ground feed upon fattening cattle, remarking that some who were once in favor of the finest grinding, now prefer coarser ground feed.

ANS.—There will always be different opinions upon this question until feeders study the effect of concentrated and bulky foods upon the bovine stomach. Naturally cattle feed upon bulky grasses, and have four stomachs to manipulate this food. If you grind corn very fine and moisten the meal, it forms into a very solid mass of adhesive dough. In this state it goes in the stomach when fed alone, and forms a plastic bolus there. It is easy to see that the gastric juice cannot circulate freely through this adhesive mass, and can only work slowly upon the outside. Now, if the corn be merely cracked up into small granules, leaving small spaces between them, the gastric juice can circulate among these, and when they are fed alone it may therefore more perfectly digest the food in that form than when it is pulverized so as to form adhesive dough. Besides, the adhesive dough, lying in the stomach for some time undigested, will often produce a feverish and unhealthy state of the system. But again, if we look to the real object of grinding grain, we see that the benefit must be derived from the comparative fineness of the particles, the finest ones being most easily saturated with the digesting fluid, and therefore most easily digested. If you mix the most finely ground corn meal with cut hay or some bulky food, you will prevent it from forming a plastic dough. The fine particles of meal being separated by the cut hay, the food will go into the stomach in a loose, spongy state, and the gastric juice can now circulate through the whole mass, and digest these fine particles of meal with greater rapidity. The finer the meal, the more easily it is digested. The cut hay or straw should be first moistened so that the meal will adhere to it. If there is any true philosophy in grinding at all, this reason is good all the way down to the finest grinding that can be done without heating the meal. The fault is in feeding this very fine concentrated food alone. If our inquirer has not facilities for cutting hay, then the next best way is, to spread a thin layer of hay in the manger, sprinkle it with water and then sift on the fine meal; this will so adhere to the hay that the cattle must eat much of the latter with the meal and thus give bulk in the stomach.

These are a few of the principles concerned in this question; but we have not space to discuss all the incidental points. Suffice it to say, that the writer has found very fine meal to produce 20 per cent more milk when fed with cut hay, than when fed alone, in a carefully tried experiment; and this must be caused by a more perfect digestion of ground feed, and the same rule will apply to fattening cattle. If the concentrated food is to be fed alone (which never should be permitted), then it should be fed dry.

The Southern Cow Pea Once More.

W. O. Jr., Trappe, Md., desires us to answer the following questions: 1. How thick ought the peas to be sown at the last working of a corn crop, to be plowed under in October for winter wheat? 2. How would it do on light land to plow the wheat stubble the latter part of June or the first part of July and sow in peas; the latter to be turned under for wheat in October? What quantity should be used and how planted? 3. Is not the yellow pea the best for fertilizing purposes on thin land? 4. What quantity of lime should be used? Should it be applied before or after the vines are plowed under, or later with the drill when seeding the wheat. 5 How would it do to sow Bermuda grass and red clover with oats in spring in an orchard to secure a standing pasture after harvesting the oats? 6. What proportion of each per acre? How would herd's grass do to mix with them? 7. Where and at what price per bushel can the Bermuda grass be obtained?

ANSWER BY DR. A. R. LEDOUX.

We referred the questions to Dr. A. R. Ledoux; he answers them as follows: 1. Some farmers sow them broadcast before the last plowing of the corn. The plowing serves to cover the peas—a rather slovenly way but saving much time and work. A better way is to drop four or five peas three or four feet apart in a furrow run between the rows, and cover them with a block, small harrow, or in any other simple way. They then require little cultivation—at most a single plowing or light hoeing to keep down the weeds until the peas obtain a fair start. 2. That is a good plan often followed. Sow broadcast or, better, in drills, three or four feet apart. Cover with the harrow followed by a board. When four or five inches high give them one good plowing. An easy way is to sow in every fourth furrow when plowing the stubble. Plowing the succeeding furrows covers the peas. I consider cow-pea vines better than clover for turning under as a fertilizer for wheat. 3. The black pea is most esteemed for turning under, as it makes very much vine. The "Clay" pea is also very good. 4. From ten to fifty bushels of lime may be used per acre according to the soil. It is not always necessary, especially on light soils. It should be sown upon the vines before plowing them under. 5 and 6. Mixtures of Bermuda grass, blue grass, and *white* clover are often sown and give satisfaction. In warm climates the blue grass and clover afford pasturage during the greater part of the winter, while the Bermuda disappears, reappearing in spring. 7. Bermuda grass bears no seed in this country. It is propagated by setting out cuttings.

Some varieties of the Cow-pea not only "make little vine," but none at all. They form a bush and occupy little more space than bush beans.

Best Breed for Improving Texan Cattle, Etc.

A reader, Pleasanton, Texas, asks, 1, whether Durham and Short-horn cattle are the same; 2, what breed of bulls would be the best to cross on Texan cows for beef and milk; 3, from whom and at what price can he obtain heliotype copies of the great master painters.

ANS.—1. Yes. The race was known about a century ago as Durham or Teeswater cattle, and both names, especially the former, are sometimes applied to them still. Short-horn, however, is the more appropriate name for the modern, improved breed. 2 For beef and milk combined there is no breed that excels the Short-horn. A large proportion of those taken to Texas, however, have died before they could become acclimated, principally from "Texan fever." The survivors, too, are reported to have deteriorated considerably, and to have lost somewhat of their power of impressing their special characteristics on their progeny. This faculty is possessed by several other breeds more powerfully than by the Sort-horns under circumstances widely different from those under which the breeds were formed; inasmuch as some other breeds, such, for instance, as the Jersey and Devon, are of longer standing and less contaminated by outside blood. At an auction sale of an imported herd of Short-horns, that lately occurred at San Antonio, Texas, the prices were very low—lower than those often realized at the North. The reason assigned was that stockmen in that section did not find the improvements by the cross, of sufficient value to pay for the extra care needed to keep the new-comers in fair condition and to insure against the large percentage of loss among them. Yet by all accounts most of what improvement is being made in Texan cattle is due to just such crosses. The Polled Angus would be an excellent breed for improving the long-horned Texans, if there were any certainty that they could become acclimated without serious loss or deterioration. For beef *and* milk the polled Norfolk would be even better. For beef alone it would be hard to beat the Hereford, and as this is even a purer breed than the Short-horn, it should be able to stand better the difference in climate between Texas and England. Further experiments seem necessary to determine which breed of cattle is best fitted to improve the Texan herds; but at present, despite some drawbacks, the Short-horns are ahead. 3. Heliotypes of the best pictures by Millais, with portrait and descriptive letter-press, large 4to, $10. Houghton, Osgood & Co., 220 Devonshire St., Boston.

Another Humbug.

J. D. P. asks: 1, whether J. C. Boyd's miniature galvanic battery is what it claims to be.

ANS.—We have had half a dozen or more inquiries about this Boyd humbug, most of which we've answered by letter; but as it seems that the country is being flooded with circulars claiming marvelous merits for the little device, it becomes our duty to warn our readers that the thing is an arrant humbug. The fellows who try to palm such frauds off upon the rural population—and too often succeed in doing so—would never dream of trying the experiment on townsfolk, except, perhaps, among the ignorant masses in the lowest neighborhoods. It is the success such rascals meet with in country places that has been the chief cause of the low opinion entertained by many of bucolic intelligence. Isn't it time that country folks should learn that the receipt of a high-colored circular is a pretty certain proof that the object it puffs is a humbug or a swindle? Every week we come across accounts of successful frauds perpetrated in this way in one part of the country or another, and for one case that comes to light hundreds never become known to the public. This special humbug is a little metallic device about the size of half a dollar, about which the circulars—a number of which have been sent us—talk a farrago of quasi-scientific nonsense. Very earnestly would we urge it upon our readers never to invest a cent in any device, speculation or enterprise which is brought to their notice by fulsome circulars or glowing descriptions in newspapers that do not even profess to discriminate in the advertisements admitted to their columns. If any of our friends should feel greatly tempted to make any such investment, let him at least wait until he has consulted us with regard to it. We promise a speedy answer and an honest one, and there isn't the slightest danger that the opportunity for being swindled will come too late after the receipt of our answer, however loud the swindler may shout "This is the last—the very last—chance."

Bone Spavin.

R. C. R., Colfax, N. C., asks, whether the following recipe will cure bone spavin of two or three years' standing:—"Corrosive sublimate, quicksilver, and iodine, of each one ounce, with lard sufficient to form a paste: apply as much as will lie on a three-cent piece, each morning for four mornings only." He also asks for any practical information on the nature and treatment of spavin.

ANS.—The recipe is good, but we doubt if it will cure a bone spavin of two or three years' standing. Applied when the disease first shows itself it might arrest it. Applying a hot iron to the part is a more active absorbent, and would be more likely to arrest the leakage from the joint. Such leakage, which produces the spavin, is caused by a strain which may be produced by bad shoeing (not keeping the foot level), by slipping, or by too severe work. A

spavin is an effort of nature to throw out bone to strengthen the joint. This bone causes the joint to become stiff and sore. Any ointment which will abate the inflamation or promote absorption is good. In all cases the animal should have absolute rest. Caustic applications have sometimes produced cures, but the safest and surest is firing, followed by softening and mollifying liniments, which will soothe the parts and stimulate the ligaments. Thorough rubbing is also good.

Remedies for Lice on Calves.

A Subscriber, Newmarket, N. J., asks for a remedy for lice on calves.

ANS.—A very simple one was given in last issue—rub dirt or sand well in among the vermin. A correspondent in the RURAL of Feb. 6, 1878, says he found plaster ground very fine and dusted on the backs of the animals, an effective exterminator. It should be thoroughly dried on the stove before application. Washing the infested parts of the animal with strong suds of carbolic soap, is certain death to all pestiferous vermin. Carbolic crystals can be bought at any drug store at from eight to ten cents an ounce at most. To one pound of common bar soap placed in a pan with some water, and melted down, add one ounce of the crystals, stirring well; and from the mixture make suds which will be cheaper than that made from prepared carbolic soap and at least as efficacious. Two or three applications at least, of any remedy, are needed, as the nits keep on hatching. The stable surroundings of the infested animals should also be thoroughly washed, as the vermin often harbor there and thence find their way to the bodies of clean animals. There is a host of other remedies, more or less efficacious, but a good washing with carbolic suds is hard to beat.

Punch and Judy.

A. P. R., asks what is the origin of the puppet show of the above name.

ANS.—The exhibition is of Italian origin, its Italian name being Policinella or Pulcinella which is said to have been derived from Puccio d'Aniello, a buffoon of Acerra, near Naples, whose humorous eccentricities in the 17th century were transferred to the Neapolitan stage. Another theory derives its name from *pollice*, the thumb, a name of dwarfs in several languages. The modern drama of "Punch," so commonly exhibited in the streets of European cities to the huge delight of crowds of children, and sometimes seen here, is supposed to have been composed by Silvio Fiorello, an Italian comedian, about 1600. It embodies a domestic tragedy followed by a supernatural retribution, the whole of which is treated in a broadly farcical manner. Punch is a short obese personage, with a grotesquely enormous hump on his back and wide mouth, long chin and hooked nose, and wearing a three-pointed cap. His wife, Judy, and his dog, Toby, are, so far as the names are concerned, of Anglo-Saxon origin, as is much of the cudgel brutality of wifely castigation.

The Audiphone.

C. C., Damascus, Pa., and several others ask information from those who have actually tested it, about the Audiphone, lately invented by Mr. Rhoades, of Chicago, and described some weeks since in the RURAL.

ANS.—For the last week or two we have had one of these devices here, and have tested it on two very deaf people, neither of whom has been benefited by it; yet when a person with hearing powers unimpaired, closes his ears so as to shut out ordinary sounds, he can hear quite well by means of the Audiphone. It would be unfair, therefore, with our present knowledge of it, and in view of the high claims put forth in its behalf, to say anything definite as to its merits. By next week or at most the week after, we expect to have tested it so fully in many cases, as to be able to speak decisively on the matter, and until then we would advise any of our friends who may be thinking of buying one, to await the results of our investigations.

Bermuda Grass.

F E. H., Granite, Col., referring to a late query and answer on the above grass, in the RURAL, says that from the description therein given of it, he is satisfied it is just the grass he wants; but he wishes further information; 1, does the top after dying down in winter grow again in spring? 2, will it bear irrigating? 3, where can the seed be obtained for trial?

ANS.—1, Yes. 2, Yes. 3, Seeds cannot be obtained. It does not bear seeds in this country. Mr. J. B. Killebrew states that it grows luxuriantly on the top of Lookout Mountain, having been set there many years ago. This mountain is 2,200 feet high. It must be propagated by cuttings of the roots, which may be dropped in furrows three feet apart.

Wood Ashes.

J. E P., Hornellsville, N. Y, asks, the value of pine and hemlock ashes as compared with hard-wood ashes, and how much one can afford to give for ashes for potatoes when the latter are worth 25 to 35 cents per bushel

ANS. The ashes of soft timber, as pine and hemlock, while they are light and small in quantity, are rich in the valuable ingredients. Pine gives but 5½ pounds of ash per cord. Hemlock gives about 6 pounds to the cord. Yet these ashes contain 15 per cent. of potash; the full contents are as follows:

	Pine.	Hemlock.	
Potash	15.3	15.3	per cent.
Soda	9.9	7.7	"
Magnesia	5.9	24.5	"
Lime	50.1	27.1	"
Phosphoric Acid	3.0	1.7	"
Sulphuric Acid	3.0	1.7	"
Silica	6.0	3.9	"
Chlorine	0.2	0.6	"

Pine ashes are therefore worth 96 cents a bushel of 80 pounds at the rate of 6 cents a pound for potash and phosphoric acid.

Black Teeth in Swine.

J. S., Mahoning, O., asks for the cause and a remedy for black teeth in swine.

ANS.—Black teeth is an effect and not a cause of poor condition consequent on indigestion. In the course of this disease acrid secretions corrode the enamel and blacken the teeth Of course, the pig cannot thrive, hence a superficial judgment pronounces the effect which is most apparent to be the cause of the trouble. The teeth are injured, and probably cause irritation or pain, and should be removed with pincers and not a punch. The pig should then get a dose of physic, or such treatment as would restore the digestive functions.

Miscellaneous.

O. C. D., Wellville, Va., has a field of winter wheat sown on rather poor land; owing to pressure of other work, he had no time to manure it before sowing, and he asks, whether a top-dressing of muck and lime would be beneficial; 2, should the muck and lime stand a considerable time after having been mixed, before being used; 3, what would be the proper time to make the application—the land is rather a light sandy loam and the wheat was plowed in.

ANS. 1. We do not think the top-dressing of muck and lime would appreciably affect the present crop. A spread of short manure now, or of superphosphate (250 bushels to the acre) in the early spring, would be preferable. 2, Yes. 3, Spring or fall—we do not know that it matters much which. You do not state what you intend to raise after the wheat.

A Subscriber, (address mislaid) sends us a pinkish stone and wants to know what it is and what it is good for. He has seen large masses of it in Mexico.

ANS.—It is gypsum, or plaster stone. Chemically it is a sulphate of lime combined with two equivalents of water. Its uses in the arts are manifold. Ground to a powder, it is applied to the land as a fertilizer. When the water is driven off, it forms the well known plaster-of-Paris used for forming casts, as a cement, etc. Mixed with other substances, as alum, borax, sulphate of potash, etc., various compositions are formed that are of more or less importance in the arts.

A. B., Oakland Co., Mich., having seen in the engraving of the Rural Grounds, in our Fair Number, that a rustic fence incloses them, asks how it is made, of what material, if it is painted and whether it is durable.

ANS.—The fence is made of red cedar, with the bark left upon it. The posts were tarred seven years ago when the fence was built. They are yet as sound as ever apparently. The cross-pieces are merely beveled or cut out with an axe or saw so as to make them conform in appearance with each other or with the posts. The work is very simple. Of course, no paint is used. We consider it very durable.

T. S. B. asks where a bran thrasher is manufactured in the Eastern States.

ANS.—Machines are made for *scouring*, that is, removing every particle of flour or middlings from bran, which is what we suppose you refer to. These are called bran "dusters," or scourers, and not thrashers. They are made by those who supply gri-t-mill machinery. A popular machine of this kind in the Eastern States is made by Huntley & Co., Silver Creek, N. Y. Write to them for information on the other points inquired about.

P. P. S., Cornwallis, Oregon, sends a beetle and asks for its name.

ANS. The beetle belongs to the family Cerambycidæ and the genus Prionus. The species has not yet been named, as far as we know, though it is closely related to Prionus brevicornis. The fauna of the Pacific slope has not been thoroughly studied up; there are still many species which are new to science. To classify and name these would be an excellent opportunity for some enterprising entomologist to make himself famous.

J. C. C., Emporium, Pa., asks whether there is any means of detecting the presence of lead ore, in the same way that the presence of iron is indicated by the magnet.

ANS.—We have never heard of any such means; nor can our inquiries and investigation discover any; nor do we believe that any exists.

H. M. T., Paris, Ark., asks, where can he get a couple of vines of the Duchess grape, remarking that he cannot afford much of a vineyard, but that he wants a few choice vines for home comfort.

ANS. The Duchess, as remarked here more than once within the last couple of months, can be had of J. T. Lovett, Little Silver, N. J. This is a new variety, and we cannot advise our correspondent to invest in "novelties", however highly we may think of them. Any one who enjoys good health is never too old or too poor to plant a few good Grape-vines, if he can spare the ground.

H. W. H., Nobscot, Mass., asks: 1, whether the "History of a Poor Farm," as published during the past year in the RURAL, is a true story; 2, whether Cow Peas would be the best fodder to sow for winter feed for sheep; 3, if so, where can they be procured.

ANS.—1. It *is* essentially true. The writer owns a poor farm and is working it up as described. 2. Perhaps not. Experiments are needed to test the value of Cow Peas in the North. 3. We shall distribute them free. We learn that some of our seedsmen propose to offer them.

J. H. G., Independence, Ia., asks as to the economy of cooking food for hogs and steers.

ANS. This query is answered at large by Prof. E. W. Stewart under "Herdsman"; our friend will apply the general information therein contained to his own special circumstances.

W. N. N., Hermitage, Mo., sends a mineral which he desires us to name, and he wants also to know if it contains silver.

ANS.—The mineral is sulphide of lead (PbS.), commonly called galena. It does not contain silver.

S. W., St. Clara, W. Va., is informed that the Chester Mammoth Corn is a yellow variety.

Miscellaneous.

WHAT OTHERS SAY.

COTTON IN CALIFORNIA. "In 1870, the first year that any cotton was grown in the State, 34 bales were produced," says the good Pacific Rural Press. "Since then the production has been irregular—one season it reached nearly 300,000 pounds while last year it was but 163,000 pounds. Most of the cotton received here is grown on the banks of the Merced, near Hopeton, although it has been raised successfully on the King's River and other points in the San Joaquin valley, as well as in Los Angeles county. There is a large area of land in the southern section of the State especially suited for the cultivation of cotton, and whenever the time arrives that proper inducements are offered in the way of manufacturing advantages and the cultivation shall be carried on understandingly, California may reckon cotton as one of her staple productions. Heretofore there has been little encouragement held out to those desiring to engage in its cultivation—the demand has been irregular and the want of care in preparing the land and caring for the plant as well as picking and placing it in the market, has not had the effect of improving the standard quality of the production. California ranks with New Orleans middlings in the market; the staple is rather short, but the color is superior, and if the same care was taken as in the choice of seed and selection of fruits and cereals, there is little doubt that it would take a high place in the estimation of manufacturers."

HOW TO REMOVE BEE GLUE FROM THE HANDS Dr. A. B. Mason writes as follows in the American Bee Journal:—"I had been examining all my hives and my hands were pretty badly smeared with the glue. My next job was some repairs in, and whitewashing my hen house. When washing my hands to remove the lime, I noticed they became quite yellow, as did the water I was washing in, and I did not understand what caused it, but I soon discovered that the bee glue was nearly all gone from my hands. Since then I keep some slaked lime ready for use during the season when handling bees. I moisten the places that I wish to cleanse and rub with the wet lime till the propolis is removed. If I use much lime, I then moisten my hands with vinegar. This is much cheaper than alcohol, and as I am sometimes called from work among the bees, to work at some one's mouth, I am not annoying my patients with the fumes of turpentine."

A HANDSOME COMPLIMENT is paid to us by the current number of the Center Democrat of Bellefonte, Pa.: "As a country-home journal no one within our knowledge better deserves a place at every fireside than the old RURAL NEW-YORKER. It is original, independent and conscientious to the highest degree, and in all respects worthy the entire confidence of its readers. The able management of Mr. Moore, its founder, has been succeeded by one much more able. Forms and precedence, so far as they interfered with the entire independence and rapid progress of the paper, have been discarded, and it stands to-day alone in a number of its more important and valuable features. The company which conducts it is composed of a few wealthy men who seem to work more for the purpose of doing good than accumulating riches. Connected with the paper are eighty-two acres of ground devoted to experiments and worked in the interests of its subscribers." Thanks, Mr. Woodward.

RELATIVE INFLUENCE OF SEX IN FERTILISATION.—It has been stated that, in order to obtain double flowers, it is advisable to make use of the pollen from double flowers, where it is possible to obtain it, and to apply it to the stigma of single flowers from which it is desired to procure double-flowered seedlings. M. Lemoine, of Nancy, it appears from the *Revue Horticole*, has tried this plan with success, and was desirous of experimenting in this manner with Lilacs, but the only double-flowered Lilac then known had no stamens, and consequently no pollen. M. Lemoine then decided to reverse the process, and to fertilize the stigmas of certain double-flowered Lilacs with the pollen from some of the best single varieties. The experiment was so far a success, that out of forty seedlings thirty at least yielded semi-double or double flowers, one of them being very remarkable for its beauty.

CHRISTMAS DINNERS IN CALIFORNIA.—It would be a matter of surprise to our Eastern friends to read a bill-of-fare of a dinner such as we sat down to Christmas Day. In addition to oysters, soup, salmon, turkey, etc., at the bottom of the bill-of-fare (they ought to be at the top), are delicious grapes, strawberries, peaches, apples, walnuts, almonds, raisins, etc. And then a further surprise would appear when they were informed that peaches are of such infinite variety in Los Angeles, that they are ripening from the fifteenth of June till the first of December, while grapes are abundant from July to December. Oranges are in market ten months in the year, and potatoes are gathered every month. Is not such a land attractive to lovers of luscious fruit?—Cal. Hort.

THE PROBLEM.—The editor of the Gardener's Monthly says: A., an excellent gentleman, does not want the office. B., a poor stick, does want it. A. and his friends stay at home and do nothing, believing that the office should seek the man. B. has his friends actively at work. They tell C. D. E. F. and so on, what a magnificent fellow B. is, and that if he is elected there will be work for all, and perhaps more, which the demagogue knows how to put forth plausibly, and the result is that B. goes into the office.

Now, the problem for our good-wishing friends to solve is, how to get the office to the good man who does not want it, and to keep out the bad but industrious worker who is not fit for it.

ENGLAND AS OUR PUPIL.—It is often seen that the home-staying father, partly from affection, but even more from new ideas, modifies his notions and methods upon the knowledge which young Hopeful brings back from school and college: and, comparing similar relationships, it is more than probable that American may play a similar part to English agriculture. The former has nothing to unlearn; she has an enormous variety of information from a rapidly increasing population of mixed origin. She may well be able to give a lesson to ourselves who are burdened with traditions, and not always wholesome prejudice in favor of what once was in vogue.

COTSWOLDS IN ENGLAND.—I have always been a great admirer of Cotswold sheep as the grandest of the long-wools. Many years ago, when I wanted to establish a herd of pure-bred sheep in my county, where at the time the principal feature in all herds was mongrelism, I wrote to Mr. J. B. Lawes (who knew my district well), and asked him what breed of sheep he would advise me to go in for. He replied that, according to his experiments, the Cotswolds gave the greatest weight of flesh in proportion to the expenditure for food.—Yeoman's Note Book.

HOW TO USE HEN MANURE.—As soon as he has his poultry houses cleaned, Mr. Kern tells the Ohio Farmer, he takes the manure and spreads it over his wheat field, or a poor spot in his meadow, and you can take his word that a man with one eye can see where he puts it. To put hen manure in a box or barrel and keep it one year before it is put to a crop, he thinks is a wrong way.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, JAN. 17, 1880.

SHORTLY TO APPEAR.

Notes from Dr. John A. Warder, T. T. Lyon, Ellwanger & Barry, P. J. Berckmans and others respecting the true Paradise Apple as a dwarfing stock, with illustrations.

On The Kinver and an entirely new French Yellow Globe Mangel as sweet as a sugar beet and as productive as other mangels—illustrated.

Leguminous Plants—grasses and valuable fodder plants, by Professor W. J. Beal—illustrated.

Important Addition to the Rural's Seed Distribution.

Special Articles from Professor S. W. Johnson, Professor F. H. Storer, Professor G. C. Caldwell, Dr. A. R. Ledoux.

A Series of short articles upon the cultivation of our choicest vegetables—illustrated.

Dairy Specialties by Henry Stewart, L. S. Hardin, Professor L. B. Arnold.

Fruit Notes by Pres. T. T. Lyon, Dr. T. H. Hoskins, Sec. Garfield and others.

Poultry Notes by Forrest K. Moreland, Henry Hales and others.

Life Engravings of the Chinese Yam (Dioscorea batatas) "Cinnamon" vine; the Tulip tree and fruit &c., &c., &c.

Small Fruit Notes will be presented later by the well-known writers whose contributions have made this journal of such value in this important department of Horticulture.

TO NEW SUBSCRIBERS.

We find that many of our new subscribers have not seen our Free Plant and Seed Distribution supplement and consequently know nothing as to its terms. We will therefore send this supplement free to all who apply until further notice.

As originally announced in our Fair No. of Sept. 6, the Plant and Seed Distribution will be completed before March 1st. This for the benefit of our new subscribers.

The perfect stranger who, "for a consideration" offers you a splendid chance or certainty of large profits or a glorious bargain, is exceedingly likely to be a very imperfect man.

While Europe is starving in spots and pinched for food nearly everywhere, our granaries are overcrowded and where to store our surplus cereals is getting to be a puzzling question in our collecting centers.

We present the reports of those who are entitled to our Corn Premiums without comment. It happens that all of the prize-takers are unknown to us either personally or by reputation. Our main object in offering the premiums was (first) to introduce what we believed to be a very valuable variety of corn, and (second) to stimulate investigation as to the best methods of corn cultivation. Our readers may best judge by the reports themselves of the extent to which our object has been gained.

The roots of plants feed on certain soluble elements of the soil, upon which their vigorous growth in a great measure depends. Can these elements be fed to the leaves so as to aid the plant in its growth? Have so-called "carnivorous" plants any power of absorbing and assimilating the decomposing bodies of the insects which they entrap, as Mr. Darwin believes? Recent experiments throw a doubt upon this theory, being one upheld merely by ingenious though invalid evidence. There can be no doubt, however, that the so-called albumen of seeds, rendered soft and soluble by chemical action, *is* absorbed by the *seed leaves* (the cotyledons or leaves of the embryo), and that the life of the plantlet in the act of germination is wholly dependent thereon. If the first leaves in albuminous seeds absorb nutritious substances, why may not the subsequent leaves have the same power?

Truly the way of the transgressor is hard. Benjamin C. Bogert, late treasurer of the Produce Exchange of this city, misappropriated about $35,000 of the funds confided to his charge, and when the inevitable discovery of the defalcation came the other day, the wretched man, ashamed to face his old-time friends, rushed unbidden into the presence of his Maker. In the full vigor of life, a respected member of his church, beloved by wife and family, honored by the community, implicitly trusted by his business associates, with a crowd of friends each ready to help him in any known difficulty, so spotless in record that even in a political canvass his personal character remained unassailed, with an apparently blameless life behind him and before him an honorable and prosperous career—and yet to turn out a criminal and a suicide!

In several parts of the country, notably in the neighborhoods of Philadelphia, Chicago and this city, the farmers who supply these cities with milk are justly dissatisfied with the prices generally obtained for it. The railroad companies and retail milk dealers divide nearly all the profits between them, leaving the producers but a mere pittance for their labor and their capital. Special attention is directed to this hardship just now owing to the good prices obtainable for other dairy products, and the wits of the farmers are at work to devise some means whereby a juster proportion of the profits of the trade shall find its way into their pockets. Here, as elsewhere, a combination of the aggrieved seems the best remedy for their trouble. An organization of some sort is the only way of making this combination effective, and it is to be hoped that the rules being now devised by a committee of the farmers of three neighboring counties, will be so wisely framed as to serve as a precedent for farmers similarly situated elsewhere.

At no time, within the last decade at least, have there been in vogue so many forms of swindling as at the present day, especially in rural districts. Among the many causes that have contributed to this epidemic of rascality, doubtless not the least is the return of prosperity to country places. To the sharper a man with money is always game, be he cityman or countryman, but especially if he happens to be the latter. The sight, in the papers, of frequent exposures of all forms of roguery together with other causes, makes the city man a skeptic with regard to offers of friendship or fortune from mere strangers; but experience has shown that the countryman is more trustful and confiding, whether visited at his own home by plausible tricksters, alluring circulars and advertisements, or approached during his occasional visits to the city by sweet-spoken swindlers always on the outlook for just such prey. Elsewhere in this issue we call attention to several schemes cunningly devised for fraudulently transferring money from the pockets of credulous dupes to those of wily sharpers. These are mere specimens of certain forms of detected dishonesty; but there is nothing so Protean as vice of this kind—nothing that assumes so many forms and disguises. These very rascals will doubtless ere long be appealing to their gulled dupes and to others, under other names in other swindles with headquarters in other places. In view of the unusual activity of these pests of society at present, farmers and others cannot be too careful in investigating all investments in which they may feel disposed to put their hard-earned money—and it would be a safe and profitable rule never to invest a dollar in any business or device puffed up by circulars or specious advertisements by irresponsible parties.

"Do you know Mr. Smith of New York State?" said the innocent cockney to the American visitor in London. We are sometimes reminded of the simplicity displayed in this query on reading over the questions sometimes asked us about various forms of swindles appealing to our readers for support. "What is the standing of Mr. Brown, of Chicago?" "Is Mr. Smith of Cincinnati, reliable?" "Will the device advertised by the circulars of Mr. Jones, of your city, do all that is claimed for it?" Such are specimen questions sent to us. Our friends should know that swindling takes a thousand shapes; that sometimes the same rascal may be hidden under all three of the above names at the above places at the same time, and all the while be known to his acquaintances under a different name. Usually such frauds operate but a short time under the same name in the same place. They do with names as they do with money—appropriate them freely, and when "found out" under one, they take another. Thus, like the Irishman's flea, it's hard to lay hands on them. Their names are generally unknown to the mercantile agencies, and before they can be investigated, they have made a haul, and have gone fishing in other waters for other gudgeons, or for the same—for gudgeons of this stripe can be caught often. We would ask our friends, therefore, in making inquiries, to send us an account of the way the parties inquired about propose to do business, and, whenever possible, to forward the circular or advertisement that attracted their attention. There is an undisguisable family likeness about all these swindling schemes, easily detected by an ordinary physiognomist in rascality.

AWAY WITH ADULTERATION OF MILK.

A Consumers' and Producers' Cooperative Association of this city has in hand a difficult but very necessary task in forcing those who supply the city with milk to furnish a healthful, unadulterated article. The laws relating to this subject should be stringent, and their enforcement should be rigidly made by the proper officers, and not be left to the efforts of a volunteer organization. The aid of the latter, however, will be always valuable in stimulating negligent and aiding vigilant officials in the discharge of their duty. Experience elsewhere shows that the quantity of milk used in cities depends in a great measure on its purity. Less than a dozen years ago the laws affecting the sale of milk in English cities were made more severe than formerly and since then they have been more vigorously enforced, with great advantage alike to consumers and producers. So greatly has the sale of milk for food been increased by these means that British dairy farming has assumed a new complexion. Instead of converting their milk into butter and cheese, the farmers are yearly finding a rapidly increasing market for it in towns and cities at much better prices than they had been in the habit of realizing from the manufactured products. This mode of disposing of milk has already assumed such important proportions, that it has become the sheet-anchor of a large section of English dairy farmers as well as a question of first moment to the public at large. The control of the milk trade in summer and its development in winter, the best methods of cooling and aerating the product so that it can be transported unharmed for long distances in hot weather, railroad facilities and rates of freight, together with the prevention of adulteration by milk-salesmen, whether farmers or retailers, have all received careful attention there, and it is certainly time that these points should meet with more systematic consideration here, not in the neighborhood of this city only, but from all who expect to make the highest legitimate profit from supplying one of the most healthful and nutritious forms of food to the dwellers in cities, towns and villages throughout the Union.

A HINT TO SEEDSMEN.

During the last few years, attention has been repeatedly called to the modern method of seed-testing whereby the proportion of valuable seeds in any given sample is accurately determined,—that is to say, the proportion of seeds capable of germinating,—as well as the proportion of foreign seeds with which the sample is contaminated. Thanks to the patience of certain scientific men in Germany, a simple and trustworthy process of testing has been worked out, and Professor Nobbe, of Tharand, has published a large book, with some three hundred figures, descriptive of the mode of procedure and of the appearances of seeds which are likely to be met with in the process of testing, both those of agricultural plants and of weeds.

The appearance of this systematic treatise has led several writers to urge that experiment stations should be established by the governments of the several States and Territories for the purpose (among others) of testing the seeds which are on sale in the American markets. But there is another way of looking at the matter which we would commend to the attention of the seed-dealers. Perhaps some of our enterprising, large-way dealers would find it for their interest to do their own testing? Assuredly the power and reputation of those houses would be enhanced, who sold (and bought) goods of whose quality they could speak with absolute certainty,—whether to praise or to blame. There is no great or insuperable difficulty in the matter. There are, at the least, eight or ten colleges in the country where the methods of testing could be taught to any intelligent young seedsman, who might apply as a special student; and under proper guidance female labor would be perfectly competent to the light and easy work of testing. It seems, indeed, as unreasonable for the seedsmen to neglect this source of knowledge and power, as it would be for copper-smelters to shrink from employing the assayers upon the results of whose tests their business is actually based.

BREVITIES.

An unusual pressure upon our space crowds out our illustrations for this number.

No man who does not take a hearty interest in his work can ever hope to ascend the ladder of progress.

We learn that some of our New York seedsmen have larger orders for green peas from England than they can fill.

This will be a specially welcome number to the winners of our corn premiums, as the first intimation of their success will reach them on its receipt.

"Horse trots at Fairs" are condemned by a host of agricultural papers just received. Glad to see so many of 'em joining in the Rural's crusade against the evil.

The Mark Lane Express says that an American states that "hogs may be planted in any kind of soil—they will root anywhere." This ought to have gone "the rounds," but we have failed to see it before.

All subscribers wishing our seeds and plants should send six cents' worth of postage stamps—that is, two for the seeds—four for the Raspberries. The rest of the postage and all other expenses we bear. All who have not seen it, should send for our seed supplement which explains the whole matter.

Here is something for the poultry fanciers to work upon. Complaints are often heard of the disturbance caused by the crowing of cocks in the early morning. In this educational age couldn't cocks be trained to crow the hour? We should like much to take the credit of this wise suggestion. But it comes from Punch.

Mr. J. B. Garber writes us that he has never had a grafted grape-vine that grew when grafted in the fall. He has had the best success in February or early in March, when the ground was dry enough. He has also had good success with grafting in April, May, June and July; the running of the sap proved little hindrance. He gets fruit the second year by grafting.

The premiums awarded this week for Blount's White Prolific corn, do not include the book premiums offered by the Farmers' Publishing Co. The competition for these will now be in order. There are six premiums, the total value of which is $30, to be awarded, as announced on April 26, for the six heaviest weights of shelled corn, the corn to be weighed three months after harvest.

E. P. Roe wants to know, in the Gardener's Monthly, whether Queen of the Market is not the Cuthbert Raspberry. We have asked the same question in our columns. Will not Judge Parry answer? Is the Conover also the Cuthbert? We believe there can be no dispute as to the Cuthbert's retaining the name by priority. Whatever the name, we believe it to be over a wide portion of the country the best hardy Raspberry in cultivation.

The request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high standing and trustworthiness.

Let us say to our new readers (our old ones are aware of the fact) that we have no interest in Blount's Corn other than what arose from the desire of disseminating what we believe to be a variety of unequaled productiveness for certain parts of the country. It was sold last season as high as $8 per bushel. It will be offered the coming season by many seedsmen. We raised, as we have stated, on a measured quarter of an acre, 18 bushels (shelled) of this corn, though several unfavorable climatic causes seriously lessened the yield. For our own seed, we selected the topmost ear of such stalks only as bore over three ears.

In writing our notes to accompany the Dwarf Buckeye, a full-page engraving of which was presented a few weeks ago, we overlooked the following memoranda made during its blooming season last summer: "There are one hundred racemes on the plant before us of pure white flowers. Each flower bears five stamens, the filaments of which are twice as long as the corolla, which is one inch in length. Each raceme bears 175 peduncles, and each peduncle from three to six pedicels, so that on each raceme there are no less than 500 flowers. The exserted stamens tipped with rose-colored anthers, give the inflorescence a feathery look, while the plant is one of great showiness."

For Women.

FIFTY YEARS AGO.

A Grandsire's Dream.

I sit within my ingle-nook,
So old and gray, I know;
I close my eyes and backward look:
'Tis fifty years ago—
Ere youth has fled, or hope is dead,
And life's sands running low.

The Christmas bells are chiming sweet
('Tis fifty years ago),
There comes the fall of fairy feet
Across the trackless snow;
And hearts beat high, to pleasures nigh,
Just fifty years ago.

From out the lvied manor-house
I see a golden glow;
And merry voices welcome us
('Tis fifty years ago),
A laughing band stand hand in hand
A crowd pass to and fro.

In hall and homestead, great and small,
Sing blithely as they go;
The smile of one is smile of all
('Tis fifty years ago),
And hearts are light and eyes are bright,
That Christmas long ago.

A face looks out from wealth of hair,
That waves o'er brow of snow;
And brown eyes droop with shyest air
('Tis fifty years ago),
And cheeks are flushed and voices hushed
To whispers sweet and low.

A kerchief crossed a swelling breast,
The heart that throbbed below
Grew restless with its own unrest;
For, ah, how could you know
That I loved you, so well, so true,
Just fifty years ago?

We trod a measure through the hall
With stately steps and slow—
Once more I hear your footsteps fall,
Your bright cheeks brighter glow,
And you are mine, by right divine,
Of love—long years ago!

Your dainty cap, your golden hair,
Your muslin kerchief's snow;
Your tiny feet that cross the stair
Less swift than mine, I know;
All these I hear and see, my dear,
As fifty years ago.

How fair you looked! How fond I loved!
'Twas well it should be so;
I gaze upon your picture now
Till tears begin to flow;
And all the past is held as fast
As fifty years ago.

It is not fifty years—and time
Has stayed for us, I know;
We hear the merry Christmas chime,
We see the falling snow;
And hand in hand so close we stand,
My love of long ago.

The voices sweet of friends who greet
Are close to me, I trow;
The fire-gleams dance in radiant heat,
The holly-berries glow.
I have but dreamt of days I've spent
Since fifty years ago.

. . . . . .

Alas, who stands demurely here,
With eyes of tender glow,
So like the eyes of you, my dear,
In days of long ago?
She smiles, I ween, at grandsires dream
Of fifty years ago! —*London Society.*

DESCRIPTION OF CUTS IN ISSUE OF DECEMBER 20th, 1879.

NOS. 1 AND 2.—KNITTED SHAWL, WITH CROCHET BORDER.

MATERIALS REQUIRED: Two bone knitting pins, No. 8 (bell gauge). A half pound of white Shetland wool, quarter pound of blue ditto.

Cast on 190 stitches with white wool, and knit each row plain until you have the size required.

The crochet border, shown in No. 2, is worked in double blue wool.

1st Row: One double into a stitch of edge of shawl, five chain, pass over four stitches, one double into the next stitch.

2nd Row: One single into the third of five chain of last row, five chain, one single into third of next five chain. Repeat.

3rd Row: One single into third of five chain, five chain, draw a very loose loop into the third of next five chain, draw the wool through the loop, draw up another loop, and work all off together, five chain. Repeat.

4th Row: One single into the third of five chain, five chain, one single into the top of last long stitches, five chain. Repeat.

5th Row: One single into the third of five chain of last row, five chain, one single into the third of next five chain, five chain. Repeat.

The little balls are attached to the border by a needle, threaded with wool. To make the balls: Cut two pieces of cardboard in circles, a little larger than you wish the balls to be, and cut in the centre of each a circular hole, about half the diameter of the whole. Put the two card circles together, and, with long needlefuls of wool sew through the centre hole, and over the outer circle of the card, so as to cover it completely and evenly, and continue thus till the centre hole is filled up; then, with a pen-knife or scissors, cut quite through the wool all round down to the edges of the card, and slip a piece of wool of sufficient length between the cards, and tie it tightly, leaving an end hanging; tear away the card, draw the two sides of the ball together, and trim the edges with scissors.

NOS. 3 AND 4.—KNITTED JACKET FOR LADIES.

MATERIALS REQUIRED: eight ounces each scarlet and gray double Berlin wool, two bone knitting pins, No. 6 Walker's gauge, a tricot hook No. 7.

This jacket is very easy to make, it is knitted in three stripes, two gray and one scarlet. The stripes are joined by a needle and wool. For the gray stripes which are made long enough to pass over the shoulder and form both the front and back stripe, cast on twenty-one stitches, knit three and purl three alternately; always slip the first stitch; continue to knit thus until you have made the stripe the length required, purling the knitted and knitting the purled stitches in each alternate row. About 174 rows will be required. These bands compose the two sides, shoulder-pieces, and fronts. The stripe for the back is knitted with scarlet wool in the same way, making it half the length. The light stripes are sewn one each side of the back, then each is folded and sewn up under the arm, leaving a sufficient space for the arm-hole. With scarlet wool work a stripe of tricot on eight stitches. For the edge of the stripes work one double into a stitch, four chain, one treble into first of four chain, pass over two stitches of tricot and repeat. This stripe is sewn to the jacket as shown in the illustration. A similar stripe serves for the sleeves, working on six instead of eight stitches. The jacket is fastened by pearl buttons.

NOS. 6. AND 7.—SCARF CROCHET.

Materials required. Berlin wool, and an afghan hook. No 000. The scarf is worked at the ends with two colors, and in the center with one color only.

Make a chain the width you wish the scarf to be.

1st Row: Work up a loop through each of three successive stitches, draw through three loops on the hook together, one chain, insert the hook through the perpendicular loops just worked, and work one double, one chain. Repeat.

2nd Row: Draw up a loop through each of three successive stitches, draw through the three loops together, one chain, work one double under the perpendicular loops, turn the wool over the hook, and repeat.

All the following rows are worked like the second.

For the edges, work one double into a stitch of scarf, three chain, pass over two stitches, one double into the next. Repeat.

The fringe is made by knotting equal lengths of wool into each loop of chain at the ends, then knotting them twice again, as shown in the design.

NO. 8.—GLOVE: CROCHET AND KNITTING.

Materials: three ounces Andalusian wool; four steel pins. No. 14 (bell guage); small bone crochet-hook; one yard of ribbon one inch wide.

Make a chain of seventy stitches, join round, work six rounds of double crochet, taking up the front horizontal loop of each stitch. (This applies to all the crochet throughout the work.)

7th Round: Two double in successive stitches, two double in the next stitch, sixty-four double, two double in the next stitch, two double.

8th to 15th Rounds: The same as last, with this exception: the increase is made in the same stitch of each round and you will have one more double at the beginning and end of each round.

16th Round: Double crochet in every stitch.

17th Round: the same as 8th.

Repeat these two last rounds eight times more.

34th Round: Work off the thumb-stitches, ten chain, one double in the first of the thumb-stitches, leaving the hand-stitches unworked. Now continue to work the thumb separately.

35th Round: One double in each of the thumb-stitches, pass over one of the chain, eight double in the remaining stitches, pass over the last of the ten chain, and repeat this round four times more. Then continue in the round twelve times more.

Now decrease by working two stitches together after each sixth double. Repeat this last row four times more.

Now decrease as before after every fourth double. Lastly, work a round, decreasing after each three double. Then work off all the stitches together, and fasten on the wrong side. This completes the thumb.

Now continue the hand. Work four rounds, decreasing one stich on each side of the thumb-gore. Work twelve rounds without increase or decrease. Work to the side opposite the thumb, and begin the little finger. This is worked on nine stitches of the under side of glove, and ten of the upper (that is, nineteen stitches in succession), make a chain of eight stitches, join with one double to the first of the nineteen stitches of finger. Continue in the round for finger, and work exactly as described for thumb.

Now work two rounds of the glove before beginning the first finger.

1st Finger: Work eleven double from the outside of glove, ten from the under side, eight chain, one double in the first of eleven double. Continue in the round as for little finger, working fifteen rounds before decreasing.

For the middle finger, work ten double on both sides of glove, eight chain between for the gore, work round taking up the gore of the first finger, and decreasing one on both sides, as described for thumb. Work eighteen rounds before decreasing.

The third finger is worked in the round and without the eight chain, as the eight chain for little finger and middle finger forms the gore. If the fingers are found not to be long enough, more rows can be added. This would be seen in working the little finger.

For the cuff:—

1st Round: One treble, one chain, pass over one. Repeat. Now work fifteen rows of patent knitting. Patent knitting is worked thus:—Make one, slip one as if for purling, knit two together. Each round is the same.

Now knit eleven rows plain knitting; cast off. Fold over the knitted part, and hem to top of treble row on the wrong side.

A piece of elastic is run through the treble row and the back of glove is ornamented with a bow of ribbon and three rows of coral-stitch, worked with black-wool (see design.)

NO. 9.—BALL KNITTING.

Materials required: Half an ounce each of scarlet and black Berlin wool, and two steel pins No. 15.

The ball is worked in patent knitting as follows:

Cast on forty-six stitches on one pin in scarlet wool.

1st Row: Make one, slip one, knit two together throughout.

2d Row: Like first.

3d Row: Work on all but the last six stitches

4th Row: Work on all but the first and last six stitches.

5th, 6th and 7th Rows: Like 4th Row.

8th Row: Work on all but the first six and last nine stitches.

9th Row: Work on all but the first and last nine stitches.

10th and 11th Rows: Like 1st Row.

This finishes one section. All the rest are worked in the same way, using black and scarlet wool alternately for ten sections.

When the last section is complete, cast off the stitches. On the back work long button-hole and cross-stitches with amber wool, as shown in the design. Sew up the two sides and one end of the ball, stuff it well with cotton wool, then sew up the other end, and ornament each with a bow of amber ribbon. Balls of this kind are better than those of india-rubber for use in the nursery. They are not liable to injure and break the furniture by coming in contact with it. This ball will make a nice present for a young child.

NO. 10.—INFANT'S JACKET: KNITTING.

Materials Required: Lady Betty wool and two knitting pins, No. 14 Walker's gauge.

As the size of the jacket is needed to be very different, according to the age of the child for which it is required, it is better to cut a paper pattern to the size and work to it. The jacket is worked lengthwise beginning at one of the arm-holes. Cast on the number of stitches required from the top of sleeve to the bottom of the jacket with the pins and wool mentioned; it will be necessary to cast on ten stitches to the inch. At the lower edge of jacket knit two stitches in one row, and purl them in the next along both the stripes.

1st to 12th Rows: Knit.

13 Row: Purl, increase one at the beginning of the row to from the shoulder.

14th Row: Knit.

15th Row: Knit one, purl one, alternately, increase one at the beginning of the row.

16th Row: Knit.

17th Row: Purl one, knit one, alternately, increase one at the beginning of the row.

18th Row: Knit.

19th Row: Purl, increase one at the beginning of the row.

20th Row: Knit.

Repeat from 1st row. In the second fancy stripe, work the increase as described for the 1st stripe: this increase is not repeated again. After the front is wide enough decrease for the second shoulder in the same proportion as the first was increased, by knitting two stitches together in each alternate row of the fancy stripes. When the front is finished cast off sufficient stitches for half the sleeve, and continue the pattern for the back, increasing the shoulder to correspond with the front of the shoulder. The back will not need to be quite as wide as the front, when half the back is worked, cast off sufficient stitches for the opening, and cast on, on another pin the same number. In the following rows work off on to one pin and continue to the other side, not forgetting the decrease for the second shoulder. Sew up under the arms and the shoulders on the wrong side.

For the sleeves, cast on the number of stitches required for the length of the arm, and knit in stripes as described for the bodice of the jacket. When large enough for the arm-hole, sew up on the wrong side.

The jacket and sleeves are edged with a narrow knitted lace made as follows:

Cast on seven stitches.

1st Row: Knit two, make two, by turning the wool twice round the pin, knit two together at the back, make two, knit two together at the back, knit one.

2d Row: Purl two, knit one, and purl one in the made stitches, knit one, purl one, knit one, purl one in the made stitches, knit two.

3d Row: Cast off the first three stitches, knit six.

4th Row: Purl two, knit five. Repeat from the first row. This is sewn by a needle and wool round the bottom of the jacket, the neck, and cuffs; a narrow ribbon is run through the knitting under the lace at the throat, and above that on the wrists to draw it to the required size.

NO. 11.—INFANT'S HOOD: KNITTING AND CROCHET.

Materials: 1 oz white, 1 oz. blue, Shetland wool 2 oz. blue, ½ oz. white, single Berlin wool; one pair of wood pins, No. 10 (bell gauge); bone crochet-hook.

Cast on 12 stitches with white Shetland wool.

Work 48 rows plain knitting, increasing in every alternate row by knitting the first and last stitch at the front and back, at the beginning and end of row.

In the 49th and every alternate row following it, decrease at the beginning and end of row by slipping one stitch, knitting one, and passing the slipped stitch over it. Continue this till your work is reduced to twelve stitches. Cast off.

Take the blue wool, and knit another piece in exactly the way described for the white. Place the two parts one over the other, the blue outside. The twelve stitches are placed at the front of hood.

For the border, with blue Berlin wool and the same pins, cast on 102 stitches for the front border.

1st to 7th Rows: Knit.

7th Row: Make one, slip one, as if for purling, knit one. Repeat.

8th to 21st Rows: Patent knitting (make one, slip one, as if for purling, knit two together.)

22d Row: Knit one, knit two together. Repeat.

23d to 27th Rows: Plain knitting. Cast off.

For the edge, work entirely round the border with white Berlin wool as follows: One double, three chain, one treble in the first of the three chain, pass over two. Repeat.

Sew one to front edge of hood. A border is worked in the same manner for the back of hood. Two lengths of chain-stitch are needed to run through the hood, to draw it to shape. These are finished with tassels tied up of lengths of wool.

NOS. 12 AND 13.—INFANT'S BOOT: KNITTING AND CROCHET.

Materials required: ½ oz. each blue and white Berlin or merino wool, four knitting pins, No. 15 Walker's gauge, and a crochet hook, No. 9.

Commence the boot at the ankle, cast on forty-eight stitches with white Berlin wool on one, No. 15 pin, for a stout child, and merino wool, and No. 16 pin for a small child; knit the stitches off sixteen stitches on each of three pins.

1st to 3rd Round: Knit three, purl three, alternately.

4th to 6th Round: Knit.

These six rounds are repeated eighteen times, commencing the 7th round with purl three, knit three, so as to reverse the basket pattern, and the 15th round with knit three, purl three.

19th Round: Divide the stitches and continue the pattern for front of foot on half the stitches with white wool for eighteen rows. Then take blue wool and commence the decrease for the toe by knitting two together at the beginning and end of each alternate row, until there are twelve stitches left, when cast off.

For the heel and sole, knit on the other half stitches with blue wool for twelve rows, the gusset of the heel is made like a stocking heel, that is:

1st Row: Knit to the center stitch, knit the two next together, turn.

2nd Row: Purl back past the center stitch, purl two together.

3rd Row: Knit past the last two knitted together, knit two together, turn, repeat these two last rows until you have taken in all the stitches, pick up the stitches at the side of heel, knit across the stitches, and pick up those at the other side of heel, knit backwards and forwards on these stitches, working the first and last stitches on the pin together with the corresponding white stitch of the front. Decrease for the gusset of the foot, knit the third and fourth stitches together, and the two before the last on the pin of every forward row continue to purl and knit each alternate row, decreasing until there are twenty-three stitches on the pin, then without decrease until you reach the first row of the blue toe, when decrease as described for the front, still joining the sole to the front of boot. Cast off the last twelve stitches, and sew up the toe on the wrong side. For the crochet frill round the ankle with blue wool work:

1st Round: One treble separated by one chain into each alternate stitch of top of boot.

2nd Round: With white wool, one single into every stitch of last round.

3rd Round: Three trebles into each of three successive stitches, pass over two stitches, and repeat.

4th Round: With blue wool, one double into the back loop of every stitch.

5th Round: With white wool, one single into every stitch.

6th Round: Three trebles into each of two successive stitches between the last trebles, pass over three stitches, and repeat.

7th Round: One double into every stitch.

A narrow blue ribbon is passed through the treble stitches and crossed in front; the front of ankle is also ornamented with a bow of ribbon.

NO. 14.—KNITTED GAITER.

Materials Required: Berlin wool, and four stee knitting plus No. 14 Walker's gauge.

Begin at the top. Cast on seventy-two stitches that is twenty-four on each of three pins.

For the ribbed top of gaiter knit two and a half inches of knit two, purl two.

For the 1st to 4th Round of calf, knit with the exception of the center stitch of one pin which is purled in every round to form the seam. Mark the stitch by drawing a piece of wool of another color through it so that you may observe to purl it in each round.

5th Round: Knit one, purl two. Repeat increase by knitting the back loop as well as the front of the loop before and after the seam in each fourth round for three times, repeat from the first to the fifth round four times, then commence the decrease in the same proportion as you increased until you have worked eight patterns.

1st to 3d Rounds: Knit. Decrease two in the first round.

4th to 7th Round: Purl three, knit three, decrease two in the fifth round. Repeat from the first to seventh round twice more, then divide the stitches as you would for the foot of a stocking, that is, take the same number for the heel as there are for the front of foot. Continue the pattern on the back half of the stitches for twenty-eight rows, cast off. Pick up the stitches at each side of the heel with a crochet hook, and knit them on the pin with the front stitches. Decrease by knitting two together at the beginning and end of every other row until only twenty-six stitches remain; cast off, and sew a strap of leather to each side of the front to pass under the foot.

The simulated button-holes are made by working one treble into a stitch at the side of gaiter (see design), three chain, pass over two stitches, and repeat. A bone button is sewn in each scallop.

NOS. 14 AND 15.—CHILD'S CHEST PROTECTOR. TRICOT.

Materials required: Berlin wool and a tricot hook, No. 8. Cut a paper pattern of the size. The chest preserver is made in one piece. It is straigh and square at the back of the waist, hollowed ou for the throat, and straight at the fronts, where i opens down the middle, and is fastened by chain

work loops and buttons. Begin to work at the back of the waist. Make a chain the length required. Work the design shown in No. 14.

1st row: Work up the loops as in ordinary tricot. In the backward row draw through two loops together, one chain. Repeat.

2d. row: Draw up a loop through the two loops drawn through together, then draw up another loop through the back loop of chain of last row Repeat. The backward row is worked as described in first row.

The second backward rows are repeated throughout.

The border is worked in point. muscovite as follows: Make a chain of six stitches, work up the loops as for ordinary tricot. In working back draw through the first loop, three chains draw through the next two loops, three chain, draw through the two loops, three chain, draw through the last loop.

2d row; Work up the six loops, draw through the two first, three chain, draw through the two next loops, three chain, draw through the two next loops.

Repeat the first row, then work two rows plain tricot, and repeat from first row.

For the edge, one double into a stitch, one chain, pass over one stitch, and repeat, one double over double of last row, five chain. Repeat.

NOS. 15 AND 16.—DEEP KNITTED BAND FOR PETTICOATS.

Materials Required: Berlin wool, and two bone pins each Nos. 8, 9, 10, and 11.

At this season of the year when ladies are so liable to take cold by changing from warm everyday dresses to thin ball costumes, this band will be found very acceptable. It is intended to be worn under the light fitting dresses, as from its elasticity it clings closely to the figure, the petticoat being buttoned to the lower part. The band is made of wool, and is warm and comfortable without increasing the size of the wearer. The band is worked without increase or decrease, the graduation towards the waist being made by working with smaller pins. Commence at the bottom. Cast on 198 stiches or less according to the size required. With No. 8 pins, purl two and knit two alternately for fifteen rows, then work with No. 9 pins for fifteen rows, then with No. 10 pins for fifteen rows, and with No. 11 pins for as many rows as you wish the band to be deep. Cast off Sew six bands of stout tape on the inside as shown in No. 5, and another piece of the same tape for a band Buttons are sewn over the tapes on the outside to which the petticoat is fastened.

PLAYING AT HOUSEKEEPING.

The Boston correspondent of the Worcester Spy gives an account of a "Kitchen Garden," established for the benefit of poor girls at the North End, which we are sure will be read with interest. She says:

"The Kitchen Garden" was first established in New York city by Miss Huntingdon, an active worker in the mission to the poor. She says that she spent hours of thought by day and night trying to devise some means by which the drudgery of the toiling children might be lightened, and they come to like the work that then filled them with weariness and disgust. The problem for her was how to teach the mass of children to put courage into their drudgery.

A kindergarten solved the problem for her. Instead of blocks and balls and colored paper, there should be brooms and dust pans and little beds; and instead of lessons in geometry, there should be object lessons in household work, given on the Froebel method, with music and songs. She tried her plan with such success, that she prepared a book with the music, the lessons and the household catechism that the children learn, to be used as a text-book by other teachers; she called her school a kitchen-garden, and her plan has already been adopted by thirteen of the New York churches for their mission schools. Last summer a Boston lady established schools here, at her own expense, and they are now in excellent condition at the Children's Mission and at the North End Mission.

A visit to one of them is very interesting and amusing, The class that I saw was of 24 little colored children, the eldest 10 or 11 perhaps, and even the youngest quite capable of helping a good deal at home. They had four teachers—one who played the piano or organ, one who led the singing, the principal teacher who gave the instruction, and an assistant who was learning the art of teaching. The first lesson was bed-making. On the long tables, with 12 children at each, were toy bedsteads about two feet long, each with a mattress, two sheets, two blankets, one spread, a bolster, two pillows, with pillow and sheet shams. The children marched in to gay music, and before they began their lesson they sang together the bed-making song:

When you wake in the morning,
At the day dawning,
Throw off the bedding and let it all air,
Then shake up the pillows,
In waves and in billows,
And leave them near windows, if the day is quite fair.

For beds made in a hurry,
A fret and a worry,
Are always unhealthful and musty, 'tis sure;
But left for airing,
Pains-taking and curing,
And one must sleep sweetly, to know it is pure.

The rules for bed-making,
If ever forsaking,
You list to the careless and hurry them through,
They'll soon grow so matted,
So hard and so flatted,
You'd wish you had listened and kept them quite new.

The beds are already made, and the first thing the children do is to prepare them for sleeping. Working together and keeping time to music, they take off the pillows and shams, turn back the spread, turn down the other clothes, and make the bed ready for its occupant. Then they take off the clothes, putting them on two chairs, to air, turn the mattress over and round, and make the bed scientifically. The rules are to make it *level, square and smooth*, and they are taught how to do this. The children are not allowed to take a lesson unless or until their heads, faces and hands are perfectly clean, and this rule has been so thoroughly enforced that the little bed-clothes, which have been in use since June, are still unsoiled and look as if they had just been done up. The questions and explanations take some time, and make a variety in the lesson.

Then came a washing lesson. Each child got her toy tub in which was a bag of clothes, table and body linen, coarse towels, and colored stockings, a wash-board and a bag of clothes-pins. No water is used; but the clothes are carefully sorted, the fine ones washed, or apparently washed without the board, then the coarser ones, and so to the end, the proper twist in hand-wringing being insisted upon; then the clothes are properly hung upon a line. A sweeping lesson is conducted in the same thorough way, each child having a broom, a brush, a feather duster, a cloth, a dust pan and small broom. Of course there is no limit to the lessons that can be given in this way. Miss Huntingdon's book has the songs and music for those I have mentioned, for setting tables and folding table linen, for dish-washing, and for simple lessons in molding butter pats, biscuits, etc., and for rolling out cookies.

The kitchen garden is intended to be a sort of preparatory or primary school, fitting the pupils for a cooking school, or other advanced course of household education. The children have great fun doing all these things, and it seems that they really learn a good deal, and even the little ones like to practice at home, as far as they can, the lessons learned and the songs sung at school. The improvement in families at the North End is said to be noticeable since the children learned to make beds, set tables and sweep The compulsory cleanliness is a great thing; the fun of it, the having a real good time, is a good thing, but the ladies who work for the kitchen garden think of it and believe in it as something which will give children some interest, home pleasures, and some ambition.

There is nothing in our present methods of education to foster domestic life, or household employment. To shirk work, go to school, and race through a series of out-door excitements, are found to be the daily routine of a majority of children, way down to those whose out-door employment is only rough street play; and this kitchen garden seems to be a way to lead them to interests at home, to wanting things in order, and to a willingness to help put and keep them so. There cannot be a child in the world who does not look with a sort of artistic satisfaction at the doll's bed which she has, with her own hands, made so square and smooth; and a majority of the children are eager to try the same thing on a grown-up bed at home. At any rate, the classes are a pleasant sight, and the plan is working well.

AGENTS NOT WANTED.

ADELINE E. STORY.

The book agent and the tree peddler are abroad in the land. When I, for one, want trees or vines or plants, I prefer to get them direct from the nurseries. There is a middleman whom it is the easiest thing in the world to dispense with. I should do this as a matter of economy, if from no other motive. It will be found in most cases a saving of at least fifty per cent., and what we get, as my experience goes, is more likely to prove true to name.

As to the book agent, he might as well turn over the leaves of his prospectus and discourse about type, cuts and binding, to the "Goddess of Liberty," if that divinity could be found embodied, as to me.

A man who thinks himself too poor to take a magazine for his wife and children, and who settles the matter of a subscription to a circulating library the moment the subject is broached, with a positive "Can't afford it." will suffer himself to be cajoled by the persistent agent, who generally "knows his man" before he has talked *at* him a minute, into buying a book which, ten to one, he never heard of before and for which he has no need, and which he doesn't read after he gets it. There are books he does want; books he has longed for many a day; but he has allowed himself to be talked into subscribing for this one that is worthless to him, and what he wants he must go without.

"Ah!" thinks the hard-working farmer as he seats himself on his plow—for you are no more out of reach of the wide-awake agent in the field than you would be in the house—to listen to the glib sing-song of the charmer, "we want some books. I'll buy this one. It is coarse print and the pictures will amuse the children."

The pictures do amuse the children certainly, and that is about the only satisfaction that is ever got out of the new book.

Literary Miscellany.

CONQUERED.

CHAPTER II.

IN BATTLE ARRAY.

When he had helped her to mount to the seat beside him and they were driving rapidly towards Arundel, Katrine, between laughing and crying, told her half-credulous auditor the story of her fright, and described to him the pale, stern face she had seen in the lonely cottage.

Maria Weddell, spinster, called, out of respect to her years and matronly appearance, *Mrs.* Weddell did not profess to let lodgings. The cottage was her own, inherited, with its half-acre of garden and orchard, from her father, and she lived on a small annuity bequeathed to her by an elderly lady, whom she had nursed through an illness that lasted from the time she was young and comely till her good looks had faded and her hair was turned gray.

So Mrs. Maria Weddell lived "independent," as her neighbors were wont to say, and kept her cheerfulness, though her cottage was the most solitary one in or near that secluded Sussex village.

Not that she was always alone. Though she steadily refused to follow the example of Mrs. Jones at the shop, and put up a bill with "lodgings to let" neatly written on it, she sometimes consented to vacate her best rooms for the accommodation of any friends of her late mistress who wished for quiet and country air; and as these friends recommended other friends, who were willing to respect Mrs. Weddell's oddities, and considered themselves favored by being permitted to occupy her apartments, they were rarely vacant, except in the depth of winter.

Mrs. Weddell was debating whether to spend her Christmas *solus* as usual, or accept an invitation of some years' standing from a married cousin at Horsham, when the question was settled for her by the arrival of another claimant for her rooms and her household cares.

A gentleman this, young, handsome, courteous, yet apt to be seized with irritable or restless moods during which he either locked his door and smoked and wrote unceasingly, or else shouldered his knapsack, mounted his bicycle, and was seen no more till he scared the country folks on their way home from market, by the glare of his little red lantern and his swift, noiseless rush past them.

He had come into Sussex, he told Mrs. Weddell, to be quiet while he prepared a volume of travels for the press; and he had engaged her rooms because he was assured that he was not likely to be worried with the intrusion of callers; and so he littered the table in Mrs. Weddell's parlor, which was just large enough for him to take three strides across the floor, with manuscripts and books of reference; disfigured her mantel-piece with his German pipes and tobacco pouches; and half affronted her by bundling a huge feather bed and three of the six blankets heaped upon it, out of his chamber, and telling her he could not consent to be smothered.

It was not often his bell rang, fortunately for himself, as Mrs. Weddell was no obsequious London landlady who studied the wants of her lodgers and made them pay for it in the bill. She had asked him on his arrival at what hour he would like to dine; the answer was at four, five, six, seven, he did not care; so she set his dinner before him at two o'clock, because that left her time for a nap before her own tea. She had inquired what she was to call him, and he replied that he wasn't particular, but would respond to any name she preferred; so Mrs. Weddell examined his portmanteau, and finding on it a torn label gummed on at Dieppe, after much study of the strangely-spelt word, decided to call him Mr. Dippy, which was the nearest pronunciation of it at which she could arrive.

Sometimes, but very rarely, Mrs. Weddell would volunteer a little conversation while she laid or removed the cloth, and her lodger leaned back in his chair and rested the eyes that ached with poring over his books. But it required a great deal of painful thought to fix upon a subject that would interest him, for he had only said "Oh!" when she informed him that —— cattle fair was coming off next week, and didn't seem to hear her at all when she announced the arrival of a circus in the village.

Mrs. Weddell was unconsciously regarding him so fixedly as she debated this point that at last he perceived it, and with one of the faint smiles that made his ordinarily stern face so pleasant, he put to her an inquiring "Well?"

"Don't you never want no amusement?"

"None but what I find here;" and he pointed to his books.

"Seems to me," Mrs. Weddell observed, "that it can't be good for anybody to study all day and every day. There's some fine big pictures up at the great house. I can get the keys for an hour or two any afternoon."

"For my accommodation? Thanks; but why should I go and see the pictures you mention? Are they *chef d'œuvres?* I mean are they the works of any of the great masters, or merely modern?"

"There ain't been a master at the great house for years and years; it belonged to a maiden lady like myself, but she's dead, and the pictures were all hers."

"I see; how well we always understand each other, Mrs. Weddell! Thanks for your offer, but I had a surfeit of paintings when I was in Italy."

"Then you've been abroad? That's another reason why you should go up to the house and have a look about ye, Mrs. Wyllis—the lady as used to live there—had been to foreign parts, and brought home no end of fine things which she didn't live to enjoy."

"And you think it would be pleasant for me to go and stare at her collection? To be admitted on sufferance that I might envy the inheritors of Mrs. Wyllis's pictures and curiosities? O, thanks Why do you propose it? I was assured that you are not in any way connected with the owners of the 'great house,' as you call it."

Mrs. Weddell looked dubious.

"Connected—that means related, don't it? No; I'm the only Weddell in this part of the county since father died; there might be some sort of a tie betwixt us and the old lady, for both our names begin with a W, but I never heard of it."

"Are you one of Mrs. Wyllis's old servants?"

Mrs. Weddell folded her arms and looked dignified.

"I never went to service in my life; we were very respectable people—father and me. I only went to 'tend an invalid just to oblige our parson As for Mrs. Wyllis, I don't think I ever saw her. She only came here nows and thens after she bought the estate; and she didn't buy it for herself, but for a great-nephew she had adopted, only they say he contrived to offend her, and so she——"

"That will do; I don't want to hear any gossiping details," he interposed, brusquely. "If you'll take the tray away, I'll go on with my writing."

"But if you'd like to go over the house, now's the time; and——"

With an ejaculation in German, the heathenish sound of which made Mrs. Weddell drop a saucer, he demanded why she insisted in harping on such a distasteful subject! He would thank her never to mention it again, and the discomfited spinster went away in a huff.

A few evenings after this, Mrs. Weddell was hastily summoned to her lodger's sitting-room. He was standing at the window, from which he had pulled back the curtain, and was pointing in the direction of the Hall.

"What does this mean?"

"Fires," she answered, laconically.

"Good heavens! the great house on fire!"

"Lor' bless'ee, no, sir. That smoke, and them lights you can see betwixt the trees, means that some of the family has come at last, and they say they're going to keep their Christmas in the old house."

The curtain was hastily dropped over the window, and a wave of the hand dismissed Mrs. Weddell, but ere she could close the door she was recalled

"Look here, I can't be disturbed by these people. If any of them come prying into your cottage, don't mention me; or if you must say anything, tell them I'm a gouty, ill-tempered, fanatical, irritable old bachelor, with a chronic ailment that makes me eschew society. You must never admit them into my rooms on any pretence whatever, and if they want to do the benevolent and force themselves upon me, tell them—tell them it will have the effect of driving me away."

"Lor'!" cried Mrs. Weddell, her cap borders standing on end, "for sure I needn't tell 'em all that! If they do come here and ask me any questions about ye—which it 'taint likely—won't it be enough to say that you're a bit querish in the head with studying so much?"

"*Mad*, do you mean?" he queried, smiling in spite of himself. "Oh! well just tell them what you choose; only keep them away from me."

And for fear Mrs. Weddell should not carry out his injunctions, the first time he heard voices approaching the cottage, he laid down his pen and hastened to lock the sash-door leading into her kitchen.

While doing so he could not help seeing through a crack in the curtain drawn over the panes of glass that one of Mrs. Weddell's visitors was the same slender, lady-like brunette who had visited the cottage a few evenings previously. She was accompanied by a pretty child, and a livery servant carrying a small hamper which he set down on the floor, and at a signal from his young mistress retreated.

The young man resolutely turned his eyes from the bright, speaking face and graceful figure of this lady, but he could not shut his ears against the liquid tones of her voice as she greeted Mrs. Weddell, admired her cosy kitchen and her cat, while the child, making friends with the latter, sat down on a beehive-chair drawn close to the hearth, and warmed her feet.

"We heard in the village, Mrs. Weddell, that you have a sick person staying with you; is that correct?"

"Quite, miss; leastways he isn't sick, not exactly so," was the hesitating reply.

"But he is in delicate health, I suppose? and he has no friend residing here with him, has he?"

"He do look pale for certain," reponded Mrs Weddell, who was very much afraid of saying anything that was not in her instructions.

"Is he obliged to keep his bed? No? Has he seen a doctor since he has been here?"

"He dont want no doctors, miss, unless they could persuade him not to sit studying so much."

"Ah! He is literary, I suppose?"

"No: he's chronical; that's what he told me to tell anyone that asked after him. And he's frenatical as well, and can't be spoken to by anybody not on no pretence whatever, or he'll pack up and go away."—[To be continued.

DIPHTHERIA.

Causes, Restriction and Prevention.

IMPORTANT PRACTICAL SUGGESTIONS FROM THE STATE BOARD OF HEALTH OF MICHIGAN.

Diphteria is, primarily or secondarily, a constitutional, or blood-poisoning disease. It attacks persons of all classes and ages, but most frequently children under 16 of age. In ordinary cases the poisoning principle of diphtheria probably enters the blood by way of the mouth and the air passages. The period of incubation of diphtheria, or the time from a person's exposure to the disease to his coming down with it, varies somewhat, being usually from a few hours to seven or eight days; in some cases it is 12 to 14 days.

The specific contagium developed by the disease itself, and by which it spreads, is diffused by the exhalations (breath, perspiration, etc.,) of the patient, through the air immediately surrounding him, as well as by clothing or other solid substances that have been brought into contact with the products of the disease. As a rule, the virulence or malignancy of the contagium is in direct proportion to the severity of the case from which it emanates, though malignant cases may result from exposure to a mild case.

The more this contagium is allowed to accumulate in the room where the patient lies, the more powerful does it become.

RESTRICTION OF DIPHTHERIA.

Diphtheria is a contagious disease, and hence the strict observance of the following precautions are of very great importance:

1. Every person known to be sick with this disease should be promptly and effectually isolated from the public; one or two persons only should take the entire charge of the patient, and they should be restricted in their intercourse with other persons.

2. The room into which one sick with diphtheria is placed should previously be cleared of all needless clothing, carpets, drapery and other materials likely to harbor the poison of the disease. This room should constantly receive a liberal supply of fresh air, without currents or drafts upon the patient. It will be well also to have the sun shine directly into the room.

3. In order that the guardians of the public health may have early warning, it is important that every case of diphtheria be promptly reported to the local board of health.

4. The duties of householders, physicians and board of health, as specified in sections 1734, 1735, 1732 and 1695 of the compiled laws of Michigan 1871, should be rigidly enforced.

5. The discharge from the throat, nose and mouth are extremely liable to communicate the disease, and should be received on soft rags or pieces of cloth which should be immediately burned.

7. The discharge from the kidneys and bowels are also dangerous and should be passed on old cloths and burned, or into vessels kept thoroughly disinfected by nitrate of lead, chloride of zinc, or sulphate of iron, (copperas), and then be buried at least 100 feet distant from any well.

7. Nurses and attendants should be required to keep themselves and their patient as clean as possible; their own hands should frequently be washed and disinfected by chlorinated soda.

8. Soiled bed and body linen should at once be placed in boiling water or in water containing chlorinated soda, chlorinated lime, or solution of chloride of zinc.

9. All persons recovering from diptheria should be considered dangerous and therefore no such persons should be permitted to associate with others, or attend school, church, or any public assembly, until in the judgment of a careful and intelligent physician they can do so without endangering others.

10. The body of a person who has died of diphtheria should as early as practicable be placed in the coffin with disinfectants, and the coffin then should be tightly closed. Afterwards the body should not be exposed to view except through glass.

11. No public funeral should be held at a house in which there is a case of diphtheria, nor in which a death from diphtheria has recently occurred. No children, at least, and it would be better in most cases that few adults, should attend such a funeral.

12. The room in which there has been a case of diphtheria, whether fatal or not, should, with all its contents, be thoroughly disinfected by exposure for several hours to strong fumes of chlorine gas, or of burning sulphur, and then, if possible, it should for several days be exposed to currents of fresh air.

13. After death or recovery from diphtheria, the clothing, bedding, carpets, mats, and other cloths which have been exposed to the contagion of the disease should either be burned, exposed to superheated steam to a degree of dry heat equal to 240 degrees Fahrenheit, or thoroughly boiled.

PREVENTIVE MEASURES.

14. Avoid the special contagion of the disease.

15. Beware of crowded assemblies in ill-ventilated rooms.

16. The grounds under and around the house should be well drained.

17. No vegetable or animal matter should be allowed to decompose on the surface of the ground near the house.

18. If any soap-factory, slaughter-house, rendering establishment, or other source of foul odors, contaminate the air which you and your children daily breathe, take immediate measures through your local Board of Health or health officer to have such nuisance abated.

19. Your own privy especially, should at all times be thoroughly disinfected, by dry earth, coal ashes or copperas-water; and the receptacle should be so constructed as to be water-tight and to be tightly covered when removed to be emptied, as it should be often enough to prevent the air about it from becoming offensive, and in cold weather so far as possible.

20. Your whole house and especially its sleeping rooms should be well ventilated.

21. Your cellar should be dry and well ventilated; it should frequently be whitewashed, and always kept clear of decomposing vegetable or other substances.

22. No cesspool should be allowed near the house. If there be one, it should either be removed or be thoroughly and frequently disinfected with sulphate of iron, (copperas.)

23. Your house drains should be looked to with scrupulous care, to see that they are well trapped, kept clear and ventilated into the open air.

24 Your house should not have uninterrupted connection with a sewer. Be sure that the waste pipes do not permit the entrance of sewer gas into the house, but that they enter the sewer through an open air space, or at least through a space freely ventilated to the open air.

25. Be sure that your drinking water is not contaminated by surface drainage, or by leakage from the drain, gas-pipes, sewer, cesspool or vault.—*St. Albin's Weekly Messenger.*

A SPECIMEN SWINDLE.

LAST week the "put and call" swindle, one of the most ingenious and successful ever perpetrated and one against which we warned our readers in our Querist Department several months ago, was practically broken up by the Post Office authorities of this city. A brief account of the affair may be a warning to some of our readers, or rather to their paper-borrowing neighbors, against a host of frauds differing only in their methods, whose circulars crowd the mails while their advertisements find prominent places in hundreds of newspapers.

In the city here the N. Y. Times deserves well of the public for thoroughly exposing the whole affair. The business was started in a "bucket shop" here in 1875. The head of the concern devised the system of roguery which proved so safe and profitable that it was soon taken up by many others. His plan was simply to advertise extensively throughout the country asking for money with which to speculate in stocks—and to pocket every dollar that was sent to him. Circulars filled with enticing descriptions of the immense profits to be made by the investment of small sums, were scattered broadcast throughout the land, especially the rural districts, and fools were not lacking to jump at the bait. All any of them ever got was a letter announcing that the speculation had proved disastrous. No stocks were ever purchased. Railroad, mining and other stocks are constantly rising and falling, and as no special kind of stock was ever mentioned beforehand in which the operator intended to deal, he always told his dupes that he had speculated in some kind which had actually fallen inside the thirty days within which he stipulated that he should have entire control of his patrons' money. The representations made were very cleverly drawn up, and, although on the surface they seemed to promise fortunes to everybody on close analyses they really amounted to nothing more than an invitation to fools to hand over their cash.

In 1878 the number of similar swindling offices had so increased and the nuisance had become so unbearable that the members of the Stock Exchange made a united demand for their suppression. The styles of reputable houses had been closely imitated and these were constantly in receipt of letters, some asking for information, others fiercely denunciatory, and all intended for the spurious concerns. In November of that year the Law Committee engaged the services of a shrewd lawyer to ferret out the matter and to use every means to break up the nefarious business. From that time until last week he has been persistently engaged in the attempt to bring criminality home to the astute swindlers; but so carefully had they operated just within the letter of the law, that although he had the advice and assistance of the United States District Attorney and of the District Attorney of this city, all his efforts failed to fix a criminal offence upon them. His investigations, however, discovered the names of the chief operators and their *modus operandi*.

He soon found out that the chief man in the business—the owner of four of the principal concerns—was one Benjamin R. Buckwalter, who established his first "put and call" swindle in 1876, at No. 10 Wall street under the name of Buckwalter & Co. He made a mistake then, however, in attempting to do a city business along with a regular country trade, and the city sharpers got the best of him. With his experience, however, he soon got a partner and started another concern at 40 Broad street under the title of Bradley & Co. As they confined their operations to simple country folks here, they made money rapidly and used it to branch out on a larger scale on the corner of Broad-street and Exchange-place as Lawrence & Co., an imitation of the reputable neighboring banking-house of Lawrence Bros. The office was small, but the building was large and imposing. On their circulars was a wood-cut of the entire block, including the United States Sub Treasury and the splendid Drexel Building on the side-wall of which was the legend, Lawrence & Co. "Bankers and Brokers," the intention evidently being to give countrymen the impression that that was the building occupied by the concern.

Here they bought up all the names they could get of farmers, villagers and all sorts of people everywhere, and actually copied the entire list of one mercantile agency embracing the names and addresses of every business man in the United States. They mailed over 1,000,000 circulars at the first dash, giving an ingenious improvement on their own "put and call" artifice, since known as the "Combination Scheme." Hundreds of our readers have doubtless, received circulars descriptive of this alluring invitation of "the spider to the fly," and those who have not, should be thankful that they escaped the temptation to "step into that parlor—" so we'll let the hundreds of our readers who know all about it, tell all about it to the thousands who know nothing about it. The circulars were models both as baits to attract the unthinking and for their avoidance of all responsibility of any kind whatsoever. If the recipient sent a good sum—say $100—he was pestered no farther; but if his remittance amounted only to, say, $10, he was tempted again and again to invest more until his folly became manifest even to himself and anger took the place of greedy hope. Then he was dropped.

So many were the "innocents" that sent in their remittances that the sharpers were all soon breast-high "in clover." The books of Lawrence & Co., show that their receipts were, in July last, over $37,000; in August, nearly $24,000, and in September, over $29,000. During that month an article printed in the New York Times, exposing the swindle, caused their receipts to fall in November to $18,000 and in December there was a further drop to $12,000. In October last, which was an average month, the receipts of one day exceeded $2,300; of another, $1,900; and so on. After paying $15,642 for mailing circulars, advertising, etc., Buckwalter's share of Lawrence & Co., profits was, for that month, $17,452 43, and altogether he has been receiving from all his concerns $22,833.33 per month. At a low estimate taken from the books of the eight concerns lately suppressed, an aggregate capital of $75,000 per month was obtained from the dupes of these sharpers.

Well, there isn't space here to tell how the persistent lawyer and the United States Post Office at length managed to suppress the various concerns, but we give a list of the names of those whose mails the Post Office authorities have stopped. No doubt many of them are already familiar to some of our readers, as the chief prey all of them hunted dwelt in rural places. Besides Lawrence & Co., Buckwalter owned Adams, Brown, & Co., No. 28 Broad-street; Allen, Jordan & Co., No. 54 Wall-street and Barnes, Garrison, & Co., Nos. 11 Broad-street and 65 Exchange-place. The mails of four other concerns were also stopped; namely, Charles Doxell & Co., Thatcher, Belmont & Co; Simpson & Co.; and Heath & Co. The two last named were run by J. M. Pattee who originally ran the Wyoming Lottery; then the Cheyenne Lottery; then the grand Distribution Company, of Victoria, Canada; then the Buillon Mining Company; then the Gold and Silver Mining Company and numerous other swindles, against nearly every one of which we have at one time or another cautioned our readers.

THE BLANCHARD CHURN.

THE present manufacturers of "The Blanchard Churn" [P. Blanchard's Sons, Concord, N. H.] have been engaged (father and sons) in making churns for over fifty years. They have devoted much time to the scientific investigation of the process of butter-making, and in developing the best mechanical means for aiding it. It has been

for many years their only business. They have carefully observed and examined every new claimant for the dairyman's favor. They have been constantly testing and applying improvements to the churn they have been making. They have been perfecting the machinery and appliances of their factory. They have been untiring in their efforts to combine every desirable quality in their churn, and to omit everything needless or complicated, and they now have the best-known churn in the country. We now offer these churns as presents to those of our friends who will send us in subscription clubs: The No. 3 [2 gallons] for a club of 10, and the No 5 [8 gallons] for a club of 14. No housewife, dairyman or dairymaid who do not already possess one of these churns, can spend a few moments more profitably than to visit their friends and neighbors, obtain their subscription to the RURAL and send them to us along with an order for a churn.

PALACE ORGAN.—Style 13, Five Stops—Five Octaves—is offered in our premium list as premium No. 83. The Loring and Blake Organ Co., Worcester, Mass., and Toledo, Ohio, make this organ. In selecting a suitable instrument of this class to offer as a present, we were guided by the advice of musical friends, and the style we give is thought to be exactly suited to the requirements of the country-home.

A case comparatively plain in appearance was selected because the absence of excessive ornamentation is a positive advantage from a musical point of view, as the light, resonant case secures a

peculiarly sympathetic quality of tone, that is the perfection of accompaniment for solo singing.

The action, or internal mechanism, is precisely the same as that which is furnished in the most elaborate cases, and is warranted for five years. There are three sets of reeds—one of twenty-eight notes, and two of thirty-three notes each. The power is sufficient to fill any ordinary room completely, and it will lead a fair-sized chorus without difficulty. The five stops—diapason, melodia, vox celeste, tremelo and forte, with the patent knee-swell, produce a charming combination of musical effects. We will present one of these organs, direct from the factory, [price $180] for a club of 200 SUBSCRIBERS.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

FOR MEN ONLY.

ADELINE E. STORY.

IF women's curiosity is as great as it has come to be considered, no doubt every one of the sisterhood who glances at the above heading, will read what follows. The woman whose good fortune it is to have a kind, thoughtful husband; one who takes her out frequently, never forgetting to see that the robes are well tucked in about her in cold weather, and thinks it *his* place and not *hers* to hold the umbrella in case of a storm; who, to lighten her labor, winds the clock every morning and attends to the locking up at night; who has never discovered that the children take all their bad traits from her, and that in their good ones they take after him; who shows as much consideration for her as he does for other women; who, in short, attends to all the little details for her comfort as though that were as much to him as his own, will think what is here said altogether uncalled for, while the woman who is fast bound to a man of a different stamp, will say: "O, I know all about those men. But there's no use in talking to them—they're too selfish to care for anything."

It is for such men as this woman's lot is cast with, that what I have to say is intended. I know that every one of you that has read thus far, will go on, because you haven't the faintest suspicion that it is meant for you, and you will want to see how some one else "catches it."

But let us see. What do you do for your wife because she *is* your wife, and it is, therefore, your duty to do your best to make life pleasant to her? You undertook the task—though then it was not so much a task—years ago. *Now* you look after your own comfort, and that is about all that you want to attend to, in that line. You use tobacco, though she dislikes it, and the smell of it in your breath and in your clothes is nauseating to her. You swear in her presence, though you would not in that of another woman, and that, too, when you know just how hateful it is to her. You are, moreover, in other respects not too choice in your use of language, obliging her to hear words from you that you would be shocked, and rightly, too, to hear coming from her lips. You spit on the floor, though you know it disgusts her. You keep your hat on in the house, and she weighs you in her mind against other men she knows, who do not—and you are found wanting. You eat with your knife, even when there is company present, and that mortifies her. You tell all the little secrets she trusts you with, to your father and brother, and that weakens her confidence in you. But these are trifles, you say. They may be, but trifles make up the sum of our happiness or unhappiness.

But you are delinquent in other respects and your faults of omission are as great as your faults of commission. You never voluntarily and of your own free act, ask her to go out with you. If she is one of the favored few and is so situated that she can go of herself when she pleases, it does not matter so much; but if she is one of the many compelled, alone and unassisted, to keep the domestic treadmill in motion, it does matter a great deal. You hitch up your team, slick yourself up a little and drive to town. You have business there, or you go there because you have nothing in particular to do, and you want to get out. But do you take your wife along? Not you, indeed, any more than you do when you drop in at a neighbor's of an evening for an hour's chat, and yet if there is any earthly mortal who needs to get away, now and then, from a scene of care and worry, it is the housewife who must make her one pair of hands do the work of two. She never asks you to take her, do you say? Perhaps if you try you will remember that she used to. She would be lacking in dignity to keep it up all her life when your actions, if not your words, plainly tell her that you don't want her to go along with you.

And then you withhold your sympathy from her in matters which are of interest to her, or which are trying to her, and being a woman sympathy is necessary to her happiness. There are many other things you do which you should not, and many which you should do and do not, but this article is growing long and so, for the present I forbear.

HOUSE-HOLD HELPS.

H. E. S.

Fringed Mittens.

MEN who are out in the cold and handle cold things, know how comfortable a good, warm pair of mittens are, and I thought I would give directions to aid the inexperienced in making fringed mittens. The yarn for the fringe is best, if spun very coarsely, and but slightly twisted. It may then be reeled into skeins

which can be colored to suit the fancy. Double and twisted yarn is best.

Have four coarse knitting-needles, and on to three of these, cast fifteen stitches each for a common-sized wrist. Double the end of the yarn you hold in the left hand, to make it strong at the edge. After casting on your sticks, knit around plain four times, then having your fringe cut in skeins, take six threads if quite coarse, or eight if fine; begin at the end of the needle: place the end of the fringe a half inch out, and knit one stitch, then turn the other part of the fringe out and knit two stitches, then turn in again leaving a loop which, when cut in two parts, will be about half an inch long. After knitting once around with fringe, knit around plain twice before putting in fringe again. Widen for thumb and narrow the end in the middle of the thumb needle and at the lower end only of each of the other needles.

Directions for Cutting and Making a Vest.

Pin the pattern neatly to the cloth, and cut out the fronts first, and mark with chalk the places for the buttons, button-holes and pockets. The remaining pieces will furnish the collar, facings, and pocket-welts. Having cut these, cut the backs, linings and pockets. For a colored vest, good, strong, colored drilling should be used for neatness and durability. White cloth ought not to be used to line colored vests; but may be used for light summer vests that are often washed.

After cutting the vest, stitch and press the little gore under the pockets and cut the pocket-places. Then baste a piece of strong linen on the under side where the buttons come, and sew on the buttons with strong, double thread. Then sew on the lining of the collar to the outside front of the vest. Stitch on the facings around the front, turn them over and press them down. Sew the outside of the collar to the lining of the vest, and baste upon it the buckram. Then fit the outside and lining neatly together, and face them down on each other.

Fruit Biscuits.

Fruit biscuits, which are so relished by many as shortcakes, may be prepared in this way: Make a crust as for biscuit, roll out a half inch thick, cut in rounds or squares. After placing one layer of these on the tin, place another layer of the same size over them; put in the oven and bake. When done, these layers are easily separated, and any kind of stewed, canned or preserved fruit, may be placed between them, and they are very convenient when one has not time to prepare pie.

Crackers.

To make good and healthful crackers, take, for five cups of good flour, one cup of melted butter; rub it well into the flour; then put one teaspoonful of soda in a bowl and pour a little warm water on it, and dissolve; have ready two teaspoonsful of cream-of-tartar, and put a cupful of cold water into the bowl that has the soda in it; when ready to turn into the flour, add the cream-of-tartar, and pour in while it is effervescing. Mix your dough and roll out half as thick as a cracker ought to be, and cut in squares or small rounds. Bake in a well-heated oven.

DOMESTIC RECIPES.

Canned Corn Fritters.

Drain off the liquor from a can of corn, chop fine, add three beaten eggs, a small cup of milk, a table-spoonful of melted butter, two table-spoonsful of flour, and a tea-spoonful of baking powder. Season with pepper and salt. Fry by the spoonful on a griddle.

Apple Tapioca Pudding.

Pare and core six or eight large, tart apples, put into a deep dish, pour over a cup of hot water, cover, place in a moderate oven, turning once or twice, and cook until tender. Have prepared one teacupful of tapioca by soaking in three teacupsful of warm water for five or six hours, and pour over the apples after draining off most of the liquid from them. Bake until the tapioca looks clear and a nice crust has formed on top. Serve with hard sauce.

Fried Onions.

Peel, wash, cut crossways so as to form undivided rings, flour well and fry in drippings for about ten minutes; drain, sprinkle with salt and pepper and serve. Mrs. M. B. P.

Cracker Pudding.

Boil one quart of milk, add seven milk crackers rolled fine, three beaten eggs, a few seeded raisins or bits of citron; flavor and bake one-half hour. Serve with liquid sauce.

Cold-Slaw.

One cup of milk, one-half cup of vinegar, two or three beaten eggs, salt and pepper with a small piece of butter. In mixing the ingredients add the vinegar last. Put into a large frying-pan, bring to a scald, add the sliced cabbage and stir until well heated through. This is for one small head of cabbage. Mustard and oil may be added if liked.

Crackers.

Two quarts of sifted flour, one cup of butter or half lard, two cups of sweet milk, one teaspoonful of soda and two of cream-of-tartar. Rub the cream-of-tartar with the shortening well through the flour, add the soda with the milk, knead and pound with the rolling-pin as long as you have time and patience. Roll thin, cut round, and bake in a quick oven.

Remedy for a Cold.

Ten ounces of gum-arabic, one ounce of paregoric, 12 grains of ipecac, one stick of licorice. Dissolve the gum and licorice in one-half pint of warm water, then add the other ingredients with a quart of cold water. A dessert-spoonful three or four times a day.

Miss C. B.

Tomato Soup.

Have a gallon of nice soup from fresh beef, skim off the top, add two quart cans of tomatoes, put through a fine sieve, make a paste of half a teacupful of flour, with butter enough to mix, and stir into the soup as it boils. To prevent its being lumpy, take out a little of the soup and mix first with it. Boil twenty minutes. Season with pepper and salt.

Mrs. Reid.

News of the Week.

MISCELLANEOUS.

Monday, January 12, 1880.

The political trouble in Maine continues. The Legislature assembled on the 7th inst., and organized. The Greenbacks are in the majority. Governor Garcelon's term of office has expired, and President Lunson of the Senate was expected to act as governor *pro tempore*, until another executive shall have been elected; but early on the morning of the 9th inst., ex-Governor Chamberlain, who is in command of the military forces of the State, issued a general order, stating that in view of the extraordinary situation now presented at the seat of government, he would assume command and protect the public property and institutions of the State, in trust, for the people, until a governor has been legally elected and duly qualified. . . . The champion for the Irish people, Mr. Charles Stewart Parnell, who has recently come to this country to invoke the sympathy of Irish-American citizens for their fellows at home, has, during the past week, been addressing large crowds in Newark, New York and Jersey City. He receives great applause from his listeners, but a feeling is gaining ground in more reflective minds that he overdraws the picture of distress and of the asserted English misrule from which Ireland is suffering.

Canadian papers say the commercial prosperity of the Dominion is retarded by her inability to make treaties. The independence of the country is being advocated. Reciprocity with this country is to follow. . . In the United States last year 175 persons were hanged. . . The President has refused to pardon Captain Gregg convicted of embezzlement in the money order division of the Chicago Post Office. . . A counterfeiter was arrested at Greenville, Miss., on the 9th inst. On his person was found several hundred dollars in spurious gold and silver coins. He is thought to be a deperado of the worst type. . . Several retail dealers of oleomargarine in this city have been arraigned for selling it for butter, on testing the case in court it was found that professed experts failed to detect the difference between artificial and real butter. . .

On Sunday January 11 an eclipse of the sun took place in California. The total eclipse was best observable across the Salinas Valley situated about 26 hours' journey from San Francisco. Many scientists observed the phenomenon. No eclipse of the sun will again be visible in California for 20 years to come.

The returns of the Commissioners of Emigration show that for the year ending December 31, 1879 there were landed at Castle Garden a total of 175,589 immigrants, of whom 135,070 were aliens. In 1878 the total arrivals numbered 121,369, of whom 75,347 were aliens. During the month of December last there were landed at Castle Garden 9,949 immigrants, against 5,320 during the same month in 1878. The Labor Bureau during the past year provided employment for 11,014 males and 5,017 females, the former including 1,379 mechanics and 9,635 agricultural and other laborers. In 1878 the number who procured employment amounted to 5,623 males and 4,945 females. The principal nationalities of the immigrants who arrived last year were: Germany, 33,571; Ireland, 22,624; England, 21,555; Sweden, 12,394; Italy, 7,220; Scotland, 6,087; Norway, 4,933; Switzerland, 4,653; Russia, 3103; France, 2,331.

Mr. Edison has made new and important improvements in the electric light. On the evening of December 28th Menlo Park N. J., the place where the inventor lives, was illuminated with 40 electric lamps. It is quite possible that electric light will be so perfected by Edison that it can be used for house light and as such eventually supersede gas. Cablegrams from England state that the news of the illumination at Menlo Park created some excitement in London and gas shares fell slightly. . . Since the above trial with electric light, Mr. Edison has been much criticised by scientific men and others, who have predicted a speedy failure to the experiment. But in spite of all, the electric circuit has been enlarged, more lamps added, and stores illuminated to perfect satisfaction. Thousands of people now visit Menlo Park to see the light; and admission to his laboratory takes place by card.

At Fort Edmonton, N. W. T., a Cree Indian was hanged on Dec. 23. The most horrible reports are given of this Indian's crimes. He had murdered a large number of people, among which were his mother, wife, and seven children, and to crown the horror he turned cannibal and ate of his own mother's flesh. . . The Grant "boom" continues, and, if there is any change at all, it grows louder with every passing week. He is supported by the leading republican newspapers, and it is not unlikely he will be nominated to hold office as President for a third term. . . The arriving European steamships report unexampled stormy passages. The ships and crews have had to battle with fierce winds and mountain waves during the first week of the New Year.

An oppressive quiet prevails in the political circles at Washington. Nothing at all of an exciting nature is taking place. The national capital is as quiet and contented as peace and prosperity can make it. A discontented politician suggested the other day that Mr. Hayes be impeached. He argued that while Grant was at the wheel there was always something exciting to talk about—either Southern troubles, Mexican troubles, or blood-curdling Indian wars; but now he finds the atmosphere too stale to breathe.

FOREIGN.

There's a severe famine in the Province of Seistau on the frontier of Persia and Afghanistan. The people are selling their children for food. . . A famine prevails in some districts of Bosnia, 8,000 people are reported to be on the brink of starvation. . . On Jan 5, a serious conflict occurred at Carraroe, Galway, between masses of peasantry and 60 constabulary. The latter fired among the crowd. Many wounded on both sides—one woman killed. . . On same day great fetes at Panama greeted Lesseps who is vigorously pressing the projected canal across the Isthmus there. A corps of engineers started on a final survey of the proposed route. . . Berlin contains 60,000 adult male Socialists, as shown by their votes, and annually brews 50,000,000 gallons of beer. . . It is said that the Government has determined to use $250,000 of the Church surplus as a fund to be loaned, at an exceptionally low rate of interest, to landlords and to local bodies, for expenditure in the construction of permanent works in order to provide labor for unskilled workmen, said loans to be repaid in thirty-five years.

Summer's Heat

relaxes the system and renders us liable to attacks of diarrhœa, dysentery, bloody flux, cholera-morbus, cramps in stomach, colic, and other painful and dangerous affections for which Dr. Pierce's Compound Extract of Smart-Weed—compounded from the best French brandy, Jamaica ginger, smart-weed, or water-pepper, anodyne, soothing and healing gums and balsams, is a most potent specific. It is equally efficacious in breaking up colds, fevers, and inflammatory attacks. Every household should be supplied with it. Fifty cents by druggists.

Coughs.—"*Brown's Bronchial Troches*" are used with advantage to alleviate Coughs, Sore Throat, Hoarseness, and Bronchial Affections. For thirty years these Troches have been in use, with annually increasing favor. They are not new and untried, but, having been tested by wide and constant use for nearly an entire generation, they have attained well-merited rank among the few staple remedies of the age.

Old men, tottering round from rheumatism, kidney trouble or any weakness will be made almost new by using Hop Bitters freely.

The Markets.

THE GIST OF THE MARKETS.

The Grain Market throughout the country is in a peculiar condition just now. Last fall Jim Keene and other capitalists formed a syndicate for the purpose of speculating in wheat, especially No. 2 Red Winter. They bought up all offered in the Chicago market and a good deal elsewhere, and their enormous transactions have had a great deal to do with the good prices obtained from wheat of late. In the expectation of a great demand in Europe, they have been holding vast accumulations here, buying grain on this side of the Atlantic at figures considerably higher than those ruling on the other side. They anticipated that by this time prices would have risen there, and the boldest of them are still confident that they can force there later on whatever prices they may please, within moderate limits. There is a report, however, that some of them are getting weak-kneed and disposed to sell out quietly at present figures, leaving their associates in the lurch. Moreover, their stocks are so heavy that there is difficulty in finding storage. This is especially the case now in Chicago, where the elevators, with a capacity of 16,000,000 bushels, are full or nearly so. Railroad cars are standing on the track there loaded with grain for which there is no storage-room; vessels in the harbor are in the same condition. Temporary storage will have to be supplied there and along the railroads. Prices have been forced so high that it is a dead loss to ship to this point, much more so to Europe. Farmers find it hard to sell, though content with the price. It is not very improbable that there will be a big break soon, with a recovery after an interval.

Prices of hogs the past week have been depressed not only by the continuance of the Chicago hog-packers' strike, but also by the warm weather which caused several packeries in Chicago and Cincinnati, and doubtless elsewhere also, to suspend operations. The strike will probably end this week, and it is to be hoped for the sake of the hogs, or rather of their owners, that "as the day lengthens the cold strengthens" will prove true. During the week there has been little change in the hog line. But just look at the prices now and at this time last year when light hogs sold for $2.65@$2.75 and heavy weights at $2.60@$3.

The Mark Lane Express, of the 6th in its review of the British Grain trade for the past week, says: "The recent frost prevented the sowing of much of the land which was intended for wheat, especially in the midlands and ten districts, where it is reported that only about one-half of the intended quantity has been sown. As the frost has now disappeared some of this deficiency, at any rate, should speedily be remedied. It is impossible as yet to state the effect of the frost upon the growing wheat, but it may be remarked that increased apprehensions are felt on this point. In France roots have been much injured by frost, and it will be difficult and expensive for cattle-owners to tide over the winter. Damp weather has rather deteriorated freshly threshed grain.

The quantity offered at Mark Lane has been small and prices were not quotably lower. Trade in foreign wheat was only slightly affected by the holiday influences during the past week, and the full rates of last Monday have been obtainable. The supply for the moment is doubly in excess of the demand, and stocks are increasing. Holders, however, do not seem inclined to press sales. There seems to be a general inclination to await a further development of the situation in America. If prices here had continued as abnormally depressed as during the first half of the year 1879, the great speculative enterprise which is now afloat in America could hardly have failed to be successful, but now, that prices in England have risen ten to twelve shillings per quarter, the possibility of a corner is materially diminished. The only noteworthy change in feeding stuffs has been a decline in maize of about 1s. per quarter, in consequence of the large arrivals and flagging demand.

SPECIALS FROM ALL CENTERS.

Until Saturday, Jan. 10.

Albany, N. Y.—Wheat—No sales. Rye dull and lower, 80@85c, in the street; sales of one car of State at 95c. per 56 lbs. Oats scarce at 50@52c. in the street. Barley steady, sales from cars No. 2 six-rowed State at 81c. Cattle, good to extra $4 75@5 50; milch cows dull; prime milkers at $45; springers $25@35; veal calves scarce at 6@7c; grass at $3 50@6 50. Sheep and Lambs—receipts 21,400, an increase of 7,800 over last week; prime sheep at 6c.; lambs dull at 5½@7½. Dressed Hogs 6@6½c.

Boston.—Since last report corn is unchanged; oats, a shade higher; rye steady; shorts a shade lower; middling unchanged; butter steady with a fall of 2c. in creameries; cheese steady; eggs unchanged; beans ditto; potatoes a shade higher; no change in hay and straw.

Flour quiet. Western superfine at $5 25@5 75; common extra $6@6 25; Wisconsin do. at $6@6 75; Minnesota do., $6 50@7 50; winter wheats, $7@7 25 for Ohio and Michigan; $7@7 50 for Illinois and Indiana; $7 25@8 for St. Louis patent spring wheats, Minnesota and Wisconsin, $7 75@9 50 patent winter wheats at $7 50@9. Corn, new 62c@64c; old 64½@67c. Oats, No. 1 and extra white 52@54c; No. 2 white, 51@51½; No. 3 white and No. 2 mixed, 48@50c. Rye, 95c@$1. Shorts, $19 50@20; fine feed and middlings, $21@22. Butter.—N. Y. and Vt. choice creameries 30@33c; fair to good 28@30c; full dairy-made, choice 28@30; winter dairy-made 20@23c; straight dairies, choice 23@25c; dairies, common to good, 18@22; Eastern 18@22c; Western, choice creameries 34@35c; choice dairy packed, 25@28c; choice ladle-packed, 22@24c; fair to good 18@20c; common $15@16; Cheese, choice Northern factory 12½@13c; fair to good 10@11½c. common, 7@9c; Western factory; choice 12@13c; fair to good, 10@11c; common, 7@9c. Eggs, Eastern, 22@24c; Northern 21@22c; Western 18@20c. Beans—Northern hand-picked Pea at $1,80@1.90 ℔ bushel; do. do. Western at $1 75@1 85; do common to good $1 65@1 75; medium choice $1 55@1 60; common to good $1 35@$1 40; Yellow Eyes $2 10@2 20; Red Kidneys at $1 75@1 85. Canada Peas 80c.@$1 00 ℔ bushel for common to choice. Green Peas $1 50@1 55. Potatoes.—Houlton and Maine Central Rose 50c. ℔ bushel; Houlton Jackson Whites at 50c. Main Central Jacksons 45@50c; Vermont Rose $45; Jackson 45; Peerless, 45@50; Prolific 50@53c. Onions $3@3 25 ℔ bbl. Apples at $1 50@2 50 ℔ bbl. according to quality. Cranberries at $5 50@7 50 ℔ bbl. Hay and Straw first quality coarse Eastern and Northern hay $16@17; poor and medium $11@15; choice Western timothy, $13@14, Rye straw $23@$24. Cotton middling, 12¾c; low middling, 12¾; good ordinary, 12¼.

Cincinnati.—Wheat 3c. lower than at last report; corn, 1 to 3c. higher; oats, 2c. higher; rye, 1c. lower; barley, steady; butter, choice Western Reserve, 1c. higher; prime, do., 1c. lower; other grades about the same; hogs unchanged, except packing, which are 5c. lower; prices of hogs kept down by warm weather.

Wheat—Wheat dull at $1 32@1.34. Corn, firm at 43@45c Oats strong at 40@41c. Rye quiet at 90@91c. Barley steady at 90c. Butter, choice Western Reserve, 24@25c.; prime, do., 21@23c.; prime to choice, central Ohio, 20@22c. Cheese, prime to choice, factory, 13@13½c.; sharp stock, 12@12½c Beans, fair to good, white, $1.15@1 35; good to prime, medium and navy, $1.40@1 50; prime to choice medium and navy, $1 65@$1 75 for jobbing lots. Cattle—Exports strong at $5@5.15; Shipping strong at $3.70@4.90; butchers' active at $2@3.40; calves, $3.50@5.25; stockers and feeders, $2.20@3.60. Sheep—Market strong, $4@4 25.

Detroit.—No report last week so no comparison can be made.

WHEAT.—Extra white Mich., $1.35¼; No. 1 white Mich., $1.35¼, spot and Jan.; $1.38¼ Feb.; $1.42¼ March; $1.44¼ April. CORN.—No. 1, yellow, 49c.; high mixed, 48½c.; No. 1, mixed at 48c.; No. 2, mixed at 46¼. OATS, firm, with an active demand: No. 1 white at 41c.; No. 2 white, 39½c.; No. 1 mixed at 39½c; No. 2 do. 38c.; Clover seed, No. 2 at $4.65; prime, $4.95; choice, $5.50. Dressed hogs, $5, a decline of from 10c. to 15c since yesterday.

Indianapolis.—Since last report No. 2 red wheat has fallen 2½c.; corn has risen from ½c. 1½c.; oats a shade lower; hogs 10c. lower.

WHEAT, firm; No. 2 red at $1.31½@$1.34. CORN firm at 39@40c. OATS steady at 36½@39. Hogs steady at $4.20@$4.50.

Liverpool, England, Jan. 10.—Wheat is about 2c. lower, except No. 2 Southern which is 4c. lower; corn 1c. lower; cheese 30c. per cwt. higher.

WHEAT:—Spring No. 3 dull at 10s. 8d.; spring No. 2 dull at 10s. 10d.; winter, new Western, dull at 11s. 6d.; do. Southern, dull at 11s. 6d. CORN, mixed, old, steady at 5s. 7½d.; do. new, steady at 5s. 6½d. CHEESE—American choice firmer at 69s. per cwt.

Louisville.—Since last report wheat has declined 1c.; white corn has risen ½c, and mixed 3½c.; oats 1c. lower; rye steady; butter steady; eggs from 3c. to 5c. lower.

The packing houses have been compelled to close for the season, owing to the failure in the supply of hogs, though a few establishments are still buying on both sides of the river. More hogs killed than in any season since 1875.

WHEAT,—Firm at $1.33. CORN.—White, 45½c.; mixed, 44½c. OATS—White, 41c.; mixed, 40c. RYE—Steady at 90c. BUTTER—Western creamery, 32@35c.; Western Reserve, 28@29c.; fair to choice country, 18@22c.; common to fair do., 10@15c. BEANS—Prime navy $1.75@1.90 for Northern hand-picked; common stock, $1.00@1.25. EGGS—Liberal supply. Fresh, 13c. on arrival. APPLES.—Green, on arrival, $3.00@4.00; choice to fancy, for store, $3.75@4.25; selections, $4.50@5.00. CRANBERRIES.—$8.00@9.00 per barrel. DRIED APPLES,—3½@3¾c. CHICKENS—$3.50@3.00 per doz. TURKEYS—8c. per lb., fresh. POTATOES—Russets, Peachblows and Peerless, from store, $1.75@1.85; Early Rose, $2.00. In other markets Peachblows are dearer than Early Rose potatoes. How is this?

Milwaukee,—Since last report No. 1 Milwaukee hard and do. soft wheats have fallen 1½c.; No. 2 Milwaukee has dropped 2½c. on spot, 3½c for February, 3½c. for March, and other grades proportionately, except rejected, which is steady; corn 1c. higher; rye 2½c. lower; hogs 10c. lower.

WHEAT—No. 1 Milwaukee, hard, $1.30; do. soft, $1.29½; No. 2 Milwaukee, spot and January, $1.27¾; February, $1.28½; March, $1.30½ bid; No 3 do., $1.15; No. 4 do., $1.06; rejected, 95c. CORN—Firm; No. 2, 40½c. OATS—Steady; No. 2, 35c. RYE—77½c. for No. 1. BARLEY—No. 2 spring, 73½c. cash. HOGS—Firm at $4.30@4.55. Dressed hogs in fair demand at $5.15.

New Orleans.—Since last report corn has dropped from 4 to 7c; hay about the same; cotton has gone up ⅛c:—

FLOUR quiet but steady; superfine at $5 50@5 75, double extra at $6@6 12½; treble extra at $6 25@6 50; high grades at $6 50@7 25. CORN quiet at 55@55c. OATS 53c. CORN meal $2 45@2 50. HAY in fair demand; prime at $24; choice at $25. PORK old, at $13 25; new at $13 50. LARD, tierce at 8½c; keg 8¾c. Bulk meats firmer; shoulders, loose, 4¾c; packed, 4½c; clear ribs, 6¼; clear sides, 7c. BACON quiet; shoulders, 5¼@5½c; clear ribs, 7¾@7¾. COTTON steady; middling, 12½c; low middling, 11¾c; good ordinary, 11⅜c; net receipts, 11,825 bales; gross, 12,635; exports, to Great Britain, 331; sales, 7,000; stock, 224,257. Weekly net receipts, 51,051 bales; gross, 55,092; exports, to Great Britain, 25,939; to the Continent, 10,412; to the Channel, 2,23); coastwise, 8,162; sales, 55,300.

Philadelphia.—Since last report Western rejected wheat has fallen 3c.; do. Penn. red, white No. 2 red sold on Saturday 3½c. lower; rye steady; Southern yellow corn 3½c. lower; Southern white 2½c. higher; oats from ½c. to 1½c. higher; butter about the same; cheese ditto, eggs 1c. lower for Penn., and 2c. for Western; bran steady; dressed hogs went up from 1c. to 1½c.

WHEAT—Western rejected $1 43; Penn. red on track $1 49@1 49½. At the Open Board No. 2 red, January, at $1 49 bid and $1 51 asked; February at $1 51 bid and $1 52½ asked; March at $1 54 bid and $1 51½ asked. RYE scarce at 95c. CORN, Southern yellow on track 59½c. OATS firm; stained, 47 1-2; mixed, 48c.; fair and choice white, 49@50c. PROVISIONS quiet; city mess beef at $13; beef hams at $16@16 50; mess pork at $13 50; extra prime at $42. Smoked hams at 10@11c.; do. in salt and pickle at 8 1-2@9½c.; clear rib sides, smoked, at 7½c.; do. in salt at 7c.; shoulders, in salt, at 4¾@5c.; do, sugar pickeled at 7 1-2c.; do. smoked at 5 1-2c. DRESSED HOGS at 5½@5¾c. LARD—Western in tierces at 7½@8c.; do. butchers' at 7 1-2c. BUTTER firm; creamery extra at 32@33c.; Bradford county and New York extra at 27@28c.; Western Reserve extra at 24@25c.; do. good to choice at 18@23c.; rolls firm; Pennsylvania extras at 32@34c.; Western Reserve extras at 22@24c. Eggs demoralized; Pennsylvania at 19c.; western at 17@19c. CHEESE firm; New York factory at 13@13 1-2c.; western full cream at 12 1-2@13c., do. good at 11@12c.; do. skims at 7@9c. EGGS were dull and prices weak under the excessive supplies and limited demand. The quotations are: Limed at 16@17c.; Interior Western at 18@20c; fair do at 21c.; strictly fresh do. at 22c., and Penn. BEEVES—Market inactive on account of the high rate of cattle West:—extra at 5¾@6c.; good at 5¼@5¾c.; medium, 4½@5c.; common, 3@4½c.; bulls and cows, 2½@3½c.; calves, 3@6½c. SHEEP—Extra, 100 to 130 lbs., 5¾@6c.; good, 90 to 100 lbs, 5¾@5¾c.; good, 80 to 90 lbs, 5¼@5¾c.; fair, 70 to 80 lbs, 5@5¼c.; common, 4½@5c. LAMBS were in demand, but few arrivals:—extra at 6 1-2c.; good, 6@6½c.; medium, 6c; common, 5 1-2 @5¾c. HOGS—The market during the past week was dull. A choice lot sold at 7 1-2c, and we quote extra at 7¼c; good, 7c; medium, 6 1-2@6¾c; common, 6@6¼c. HAY AND STRAW are held firmly.—Oat hay at $19.00@$20.00; prime baled timothy hay at $18.00@$19.00; Rye straw at $21.00@$22.00, and wheat and oat do., at $12@$13. BRAN—$17.50@$18.25.

St. Louis.—Since last report No. 2 red fall wheat has declined from ½c. to 1c. for cash, 1¾ for Feb. and 2¾ for March; corn 1½ higher; oats ½c. higher; cattle about the same as at last report with a slight upward tendency.

WHEAT.—No. 2 red fall $1.35½@$1.36 cash; $1.36 Jan.; $1.38½@$1.38¾ Feb.; $1.41¼@$1.42 April; No. 3 do. $1.21 bid. CORN.—37½ cash. Oats slow at 37½ cash. RYE, 83c. BARLEY dull; choice to fancy 75c.@900. HOGS.—Light shipping at $4.20@$4.25; packing at $4.35@$4.50; butchers' to fancy at $4.50@$4.60. CATTLE firm, with a good demand, but in light supply; choice to fancy fat steers, 1,600 lbs. average at $5@$5.25; good to prime at $4.40@$4.90; light, well fleshed steers at $4@$4.30; cows and heifers at $2.50@$3.50; feeders at $3.50@3.75; stockers at $3@3.50; corn fed Texans at $2.75@$3.75; receipts, 500; shipments, 1,300. Sheep firm but scarce; 90 to 110 lbs. average at $4.25@$1.75; extra heavy at $4.75@$5.25.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 10, 1879.

BEANS AND PEAS.—The bean market shows a wholesome tone of resuming business, and all fine qualities are quoted with confidence. At the moment the leading attention is given to marrows and mediums, with exporters expressing an early want of supplies of the latter for W. I. use. Southern B. E peas per 2 bu. bag, $2.25; green peas, firm; $1.80 at station; 1.85 from store; medium beans, fair to prime, $1.35@1.55; marrow, $1.45@1.57½; pea, $1.45@1.70; w. kidney, $1.75@1 85; red kidney, $1.60@1,75; black or (turtle soup), $1.75.

Receipts of beans for week, 5,300 bush.

BEESWAX.—Demand is small and prices unsettled. Sales at 21½@25½c. for Western and Southern.

Exports for week, 4,828 lbs.

BROOM CORN—has tended a little higher on small offerings; choice brush at 9c.; choice hurl at 8c.; stalk brush at 6@7c.; mixed red and green at 5@6c.

BUTTER.—The demand is not sharp at the winter prices, but is perhaps quite as brisk as might be expected in connection with mild weather. The cheapness of stock always suffers neglect when it shows poorly on the trycr, and several warm days this week have hurt the selling appearance of medium State and undergrade Western. Fine quality is not over-plenty and receives only trifling additions from late receipts of summer and fall make. There is a marked improvement in winter made stock, and the inquiry for nice fresh State and Western is becoming a notable feature in the trade. General receipts are light, and all reserves of fine table grades seem to have a good future, and the remaining few country owners will participate in the later profits of the market. In the opinion of the trade there will be no long rule of much higher figures than are now recorded; an admission, by the way, that does dot suit owners who took up speculative purchasing just after the timely buyers left off.

State and Western are usually close together in figures for all useful grades. From the light supplies this Jan. it would seem that many Western marks strike a newer market.

Quotations:—State pails and tubs, choice, 29@30c.; fair to prime, 22@25c.; fresh made, 26@27c.; full dairies, good to fine, 21@23c.; other, 22@26c.; firkins, 21@23c.; Welsh tubs, 22@22c.; poor State, 20@22c.; creamery, fancy, 36c.; prime, 35c.; poor to good, 25@28c; sweet cream, 33@34c.; Western imitation creamery, 23@28c.; dairy, fresh, extra, 25@26c.; poor to prime, 18@24c.; factory, best, 22@23c.; poor to good, 18@21c.; very poor, 16@17c.; rolls, 23@22c.

CHEESE.—Shipments for the week, 33,536 boxes. There has been considerable activity, shippers disposed to buy freely all grades, and with the statistical position showing much more favorable to producers, prices are higher and closed strong.

Quotations are for State factory: Fancy, 13½c.; good to prime, at 12½@13½c; fair to good, at 11½@12½c.; half-skimmed at 10½@11½c. State farm dairy: Good to prime 12½@13½c.; fair to good at 11½@12½c. Wis. factory: Fine, 13½@13½c; good to prime 12½@13½c. Ohio factory: Cheddar, fine, at 13½@13¾c.; do., fair to good, 11½@12½c.; flat, fine, 13½c.; flat, good to prime, 12½@13½c.; flat, fair to good, 11½@12½c.; half-skimmed, 10½@11½c.

At the close holders of strictly fancy factory demand 14c., and feel that it will be supported.

Receipts for week, 15,628 boxes; exports, 31,000 do. Cable quotation, 68s.

COTTON.—The market has been active, and closed easy at for Jan. 12.53@12.50c.; Feb. 12.91c.; March, 13.27@13.28c.; April, 13.43c.; May, 13.67@13.90c.; June, 13.84@13.85c.; July, 13.73@13.85@13.91c.; August, 14.03@14.01c. Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—Apples have a fair inquiry at easier prices. Peaches are slow and unchanged. Small fruits are quiet and steady. Prices are For Apples—New North Carolina, at 7@8 c.; for fair; 10@10½c. for choice; 11c. for fancy sliced. Patent evaporated, apples, choice, in cases, at 15c.; do. fair to good, 13½@14c; N. Y. State sliced, new, 7¾@8¾c.; do, quarters, choice, 7@8c.; new southern quarters, scarce and nominal; new North Carolina peeled peaches 17@19c., do., Georgia, 13¾@16c. Peaches, Delaware evaporated, peeled at 23@25c.; do. unpeeled at 15@16c; new halves at 6c. Blackberries at 9@10c. for new. Raspberries at 26@26½c. Pitted cherries at 18@19c.

Exports for week, 177 bbls. apples,

EGGS.—Receipts for the week, 6,875 bbls.: do. last week 4,918 do. There has not been an active day since our last, and prices have broken under light receipts. For Cincinnati and Louisville lots, 17c. is extreme. Selected Western and Southern are taking the trade from near point stock as there is not enough difference in quality to warrant 2@3c. against the buyer.

Near points 20@21c; State and Pa., 17@19c.; Western, fresh, 16@18c.; fair to good, 16c., Southern, 15@15c.; Canadian and Western, inferior, 13@16c.; State limed, 14@15c.; Canadian, 13@14c.; Western, 13@14c.

FRESH FRUITS.—Apples are dull; buyers are suspicious of stored stock, and there will be few quotations of load lots until the weather hardens. Spitzenbergs, ₱ bbl., $3@3.50, which is lower; Baldwins range, $1.50@2.25; Greenings, $1.00@2.50; spotted and scalded lots unsettled, the buyer generally obtaining his terms. Cranberries extremely firm. Cape Cod, fancy, ₱ bbl., $8.50@9; fair to other cape and Eastern, bbls. $6.50@8.25; N. J. crates, $2@2.37; selected, $2.50. Grapes have outlived their welcome; only very choice cases bring $2.75@3. Florida oranges do not improve in quality, and, of course, not in prices; only bright-colored, uniform-sized stem fruit bring, $4.50, bf. bbl. case; other sorts, $2@3. Peanuts continue active at 5@5½c. per lb. Hand-picked Va., good to fancy, 4@4½c. Pecans steady, 10@10½c. Hickory nuts dull at 5@7c.

FLOUR.—The supplies have been liberal, and there are free sellers at easier prices, caused by a reaction in wheat values.

Latest prices are $4.85@5.00 for inferior to fancy superfine State; $5.10@5 90 for inferior to very good extra do., odd lots and trade; $5.90@6.25 for very good to choice do.; $4 85@5.00 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $5.05@5 90 for inferior to good shipping extra do., and $5.10@6.25 for good to very choice shipping extra do.; inferior to about choice White wheat extras, $5.90@7 00, choice to very fancy do. $7.10@8 25; red and amber wheat, inferior to fancy grade and family, at $6@7 85; round hoop Ohio, $5.75@6.25; and trade and family brands of do, at $6.35@7.85; the latter rate for fancy; St. Louis at $6 00@6.85 for inferior to very good extra; $6 85@8.00 for very good to fancy; Minn. clear, very inferior to fancy, at $6 85@6.85; Minnesota "straight," very inferior to fancy, at $6.50@8.00, and patent poor to very fancy, at $7.25@9.25; Canada stock at from $5 85@8 75, city mill extra at $6.50@6.90 for about fair to very choice for West Indies, fancy do. quoted at higher figures); do. for England, $6.05@6.00 for poor to choice; do. trade and family extras, $7.00@8.00; do. for South America, $6.05@7.10; No. 2 at $4.00@4.10 for poor to fancy. Buckwheat flour moves out moderately well at $2.00@2.45.

CORN MEAL.—Is selling at $3.10 for Brandywine; $2.00@3.10 for yellow Western; and $2.75@3.00 for white Western.

FURS AND SKINS.—There is a temporary firmness in the market for lots suitable for London February Sales. Prime skins quoted:—

GRAIN.—Wheat has been more freely offered and prices have declined. The slack export trade, which has taken only 310,000 bushels for the week is the main cause for the lower prices. Latest prices are of No. 1 white at $1.51@1.51¾; do., January, at $1.51½@1.52; do., February, at $1.54½; do., March, at $1.56; No. 2 white at $1.48; ungraded white at $1.50; No. 2 red at 1.53¾@1.54½; do., January, at $1.51@1.51½; do., February, at $1.54¾@1.56¼; do., March, at $1.56¾@1.58; ungraded red at $1.48@1.40; mixed winter at $1.48¾. Rye at 93½c. for No. 2 Western and 95c. for State. Corn has had a better export demand, some 305 000 bushels taken for export through the week, with prices at the close strong. Latest sales are of No. 2 at 53½@55c.; do., January, at 53¾@53¾c.; do., February, at 53¾c; New York steamer mixed at 55¾@58½c.; do., January, at 58¼@55½c; ungraded mixed western at 57@60c; New York No. 3 at 53¾@56½c.; steamer white at 62c.; round yellow at 70c. for old and 68c. for new; No. 2 white at 66c. Oats are weak and irregular; latest sales are of No. 1 white, at 50¾@51c.; No. 2 white at 49½@50c.; do., February, at 51½c.; No. 3 white at 48½c. New York No. 1 at 49@49½c; New York No. 2 at 48¾@49c.; do., February, at 49¾50½c.; New York No. 3 at 1-c.; ungraded white western at 48@52c.; ungraded mixed western at 47@50c.; white State at 50¾@51¾c; mixed State at 48@49c.; No. 2 Chicago afloat, at 49c. bu.

HAY AND STRAW.—The market displays a fair degree of activity, and prices unchanged. Shipping hay quoted at 70@75c.; retail lots at 70@80c. for medium, and 85@90c. for prime; clover at 55@60c. Straw at 85@95c. for long rye; 65@70c. for short rye, and 55@60c. for oat.

Exports for week, 2,169 bales.

HONEY—Holders aim to start trade by marking off a cent. White clover, single comb, ₱ lb, 17@18c.; larger pkgs, 14@15c.; buckwheat, 11@13c.; clover extracted, 10@12c.; strained, 8@9c.

HOPS.—Mr. Wells, in his circular, says:—"We have to report another dull week in hops, and, as estimated in our last, a reaction must take place in London, and our export trade revive before any market improvement can be looked for here. The demand from our brewers is entirely of a retail character, nobody feeling disposed to buy beyond actual present wants, or to stock up at present prices; a continuance of this state of things will make a dull, dragging trade, which can only be improved by fresh orders from abroad. All quotations are entirely nominal."

Quotations are for New Yorks, new crop, choice, 38@40c.; New Yorks, new crop, medium, 34@36c.; New Yorks, new crop, low to fair, 30@32c.; Eastern, new crop, 30@35c.; Wisconsin, new crop, 30@35c.; Yearlings, 7@15c. Olds, all growths, 4@10c.; Pacific coast, new, 35@40c; Pacific coast, olds (nominal), 7@12c.; Bavarians, 50@55.

	Bales.
Receipts for the week	536
Total receipts since September 1, 1879	69,435
Total receipts for same period in 1878	41,434
Export clearances for the week	305
Total exports since September 1, 1879	39,798
Total exports for same period in 1878	15,380
Imports for the week	49
Total imports for the season	1,003

LEATHER.—Quotations are, for hemlock sole, 27@29c.; for light, 27@28c.; for middle, 27 to 30c; for heavy, 25 to 28c for good damaged.

OIL-CAKE.—Is generally held at $35 per ton.

OIL PEPPERMINT—We learn from prominent exporters that the stock here is almost nominal, and if any demand exceeding ordinary druggists' wants should arise, the supply would have to come from London, where almost two crops have been speculatively concentrated.

POULTRY AND GAME.—The push of the dressed poultry trade is over, and the season will have to be ranked as one of the poor paying ones. Small turkeys are in fair demand. When large and small are mixed outside prices are full. Prime chickens move fairly, but easy prices for all lines of poultry except special. Near point, dry picked are easy.

Capon, large, quoted at 20@22c.; small and slips, 16@19c.; Turkeys, N. J., 11@12½c.; State and Western, prime, 10@11½c.; fair, 8@9c.; Philadelphia dry picked, 12@13c.; do. chickens, 10@11c.; N. J., 10½@12½c.; other, 9@9½. Fowls, dry picked, 10@11c.; N. J. 9¾@10½c.; other, 8@9c. Ducks, choice, 13@14c.; other, 10@12c. Geese, extra, 10@12c; other, 7@9c. Squabs, white, ₱ doz., $2.00@2 25; dark, $1.25.

Live prime fowls have had a fair sale at 9@10c.; Western dull at 8½c.; roosters, 5c.; turkeys, 8@9c; ducks, 45@75c.; geese, choice, $1.65@1.75; other, 87c.@$1.37;

Receivers of game have discouraged shipments during the detrimental weather. Demand not large for any variety.

Canvas back ducks, $3@3.25; red head, 90c@$1.25; Mallard, 60@75c.; teal, 30c.; black, 40@50c.; common, 30c. Quail, trapped, $3. Partridges, prime, 70@75c. ₱ pair, including Canada, 40@50c. Grouse, $1@1.12. Prime wild pigeons, 80c@$1; acorn fed, 70@75c. Rabbits, ₱ pair, 15@20c. Hares, 20@25c.

PROVISIONS.—Hog products have been slow and rather week in price. Mess pork closed at $13 80@13.90 for new mess for January; $14.35@14 00 for February, and $14.10 for March. Bacon at 7¾c. for long clear and 7¾c. for short cleir. Lard, Western steam at $3@3.02½ for spot lots; $3.03¼ for January, and $3 05 for February and $3.15 for March; Stearine at 7¾@8 for choice Western. Beef at $10.50@11.00; extra mess at $11.00@12.00; packet at $13.00@13.50; tierced beef, city extra mess, at $11.50@12.50. Beef Hams at $16 85@$16.00.

SEEDS.—Grass are fairly active; Clover quoted at 8½@8¾ for prime to extra choice, and 9¾@10¾c. for prime to fancy. Timothy quiet and not quotable. Flaxseed quoted $1.70@$1.75.

TOBACCO.—Trade has been very quiet and prices have not shown important change.

VEGETABLES.—A fair shipping demand has kept some life in the market, but as a rule prices are easy at old rates. The weather is mild, and some buyers could be induced to stock up if prices for fine were shaded. Onions, steady, sales chiefly red. Celery, scarce and higher. Cabbage firm. Squash sell freely now that pumpkins are out of the way.

Nova Scotia E. bbls, bulk bbl. $1.50@$1.60; do. Prolific, d. h., $1.37@1.52; do. Mercer, $1.12@1.37; Multic., Early Rose, d.-h., $1.50@1.75. State, h. and d.-h., $1.25@1.50; Peachblows, white, $1.87@2.00., do. red, $1.75@1.85; Snowflake, $1.37@1.50; State Peerless, $1.12@1.50; N. J., do., 75c.@87. Marrow, and Hubbard squash, $1.25@1.50₱ bbl.; cabbage, $2@6 per 100; onions, white, per bbl., $4@4.50; yellow, $2.50@2.75; red, $2.25@2.50; Chester, $1.75@2.25., beets, $1@1.50; Russia turnips, 75c.@$1; carrots, 75c.@$1; celery, per doz., $1@3. Exports for week 4,900 bbls. potatoes; do. onions, 180 do.

WOOL.—There has not been much done this week, but business will probably be fairly under way shortly from the lull which usually prevails about the holidays. Prices generally are strong.

Ohio, Pennsylvania, and West Virginia—XXX, 35@38c.; XX, 31@35c.; X, 30@33c.; No. 1, 25@31c.; No. 2, 27@30c.; coarse, 25@40c.; combing, 33@37c.

New York, Michigan, and Wisconsin—XX, 47@50c.; X, 47@50c.; No. 1, 32@35c.; No. 2, 46@50c.; coarse, 33@40c.; combing, 50@51c.

Indiana, Kentucky and Tennessee—X and XX, 46@50c.; No. 1, 32@36c.; No. 2, 16@30c.; coarse, 38@40c.; combing, 50@51c.; combing unwashed 37@40c.

Illinois, Iowa and Minnesota—X and XX 43@47c.; No. 1, 28@32c.; No. 2, 25@15c.; coarse, 37@40c.

Georgia, Alabama, Mississippi and Louisiana—fine unwashed, 43@45c.; medium unwashed, 40@43c.; coarse unwashed, 30@32c.; burry, 18@21c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Jan. 10.

BEEVES.—Receipts for the week, 10,216 head; do. last week, 9,422. Moderate receipts have kept the market steady, and the closing sales are ½c. higher than on Wednesday. The range of sales was as follows: a car-load of yearlings and heifers, 2½@2¾c. liveweight; common dry cows, 3¼@3½c. oxen, 6¾@6c; the latter to dress 55 lbs. Common to fair steers, 7¾@8c., dress 53¾@56 lbs.; good to extra, 9¾@10¾c., dress 56@57 lbs. One premium bullock of 1,360 lbs. sold at 12c., to dress 53 lbs. The export demand is moderate and seems to be for special orders.

MILCH COWS.—Market quiet with small receipts; the quoted range is $30@40, with sales of 18 State at $35@35.

VEAL CALVES.—Supplies are not oppressive, and good, steady prices have ruled for live and dressed. New Jersey and Bucks Co. choice 7¾@7¾c.; other and State, 6@7c.; Mount Holly's range at 6@7¾c., 300 lbs. and over, down; buttermilk, 3¾@4¼c.; grass, 2¾@3¼c.; hog-dressed calves, choice, 9¾@10c.; fair to good, 7¾@8c.

SHEEP AND LAMBS.—Receipts for the week, 21,829 head; do. last week, 19,734 do. Trade has ruled active most of the week. An attempt to put up prices checked business for a time, but later on within a shade of concession the pens were cleared. Sheep $4.98@$6.40 ₱ 100 lbs.; lambs, $6.15@$7.50 do. A car load of extra heavy Ohio sheep sold at $6.52 for export.

SWINE.—Receipts for the week, 29,914 head; do last week, 15,946 do. Demand steady and supply, well sold up at 4¾@5c, the extreme for good 200 lbs average Ohio

Light dressed pork is mostly selling as the weather is unseasonably warm.

Country pork, light, 6¾@7c.; medium, 6¾@6¾c.; heavy, 6¾@6¾c.; city, dressed, 6¾@6¾c. Pork tenderloins, 11c.

International Dairy FAIR PRIZES.

Both the Sweepstakes Prizes, at the International Dairy Fair, just closed, "for the best butter and cheese made anywhere," were salted with English salt (Higgin's Eureka brand), as were also most of the other lots taking prizes. Higgin's Eureka Salt took the first prize at the Centennial Exhibition, 1876, the Paris Exhibition, 1878, also at the Fair of the British Dairy Farmers' Association, London, 1879; Royal Irish Dairy Fair, Dublin, Dec. 10, 1879; and at more than forty State and County Fairs in the United States.

The British Government has granted a patent to Thomas Higgin for an improvement in salt manufacture, and the consumption in this country has risen in three years from 6,000 to over 70,000 sacks, while during the same time the consumption of brands heretofore thought to be the best, has largely decreased. If this means anything, it means that Mr. Higgin's improved process is working as great a revolution in salt as the Bessemer process has in steel, or new process milling in the manufacture of flour. The difference in the cost of using the best salt for butter and cheese is too small to be considered a moment (being less than one thirtieth of a cent per pound on on butter, and one-sixtieth of a cent per pound cheese).

The prize cheese and butter salted with Higgin's salt sold for an extra price more than a hundred times this amount: therefore

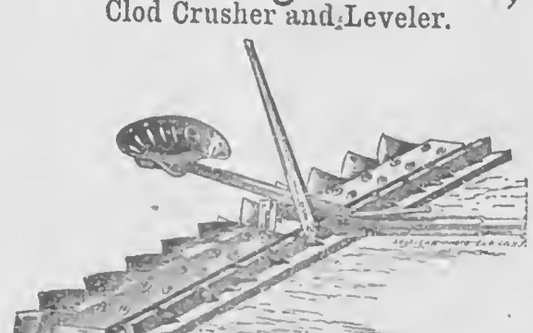
It Pays

to use the best salt. Factory men who manufacture for their own account cannot afford to use cheap salt, and milk producers who have their butter and cheese made up for a certain price can afford to pay more if Higgin's Eureka Salt is used. It is the purest, strongest, and most uniform grained salt ever manufactured, and instances of the keeping properties of butter and cheese made with it have been quite remarkable.

Ask your dealer for the Illustrated Dairyman's Almanac, for 1880, describing how salt is manufactured. If he is unable to supply it, a postal card to the undersigned will receive attention.

H. K. & F. B. THURBER & CO.,
Importers, New York;
B. P. & C. E. BAKER,
Western Agents, Chicago.
For Sale by nearly all Dealers in Salt.

"ACME" Pulverizing Harrow,
Clod Crusher and Leveler.



Has two steel rocker teeth and ten steel cutting spurs. Cuts over six feet wide, and two to four inches deep. The only implement combining Pulverizer Crusher and Leveler that performs all three operations at one time in the most perfect manner. Works perfectly on light soil, but is *especially adapted to sod and hard clay where other Harrows fail.* Agents wanted. Send for circular. NASH & BRO.,
Harrisburg, Penn., and 22 College Place, New York.

CHERRY TREES.

E. Richmond, No. 1, 3 years, $30.00 per 1,000. Dwarf Pears, No. 1, $60.00 per 1,000. No. 2 Plum Trees, 2 years, $100 per 1,000. Cherry Seedlings, No. 1, $6.00. Apple stocks, light, $3.00 per 1,000. Pear Seedlings, No. 2, $3.00 per 1,000. Apple seed.

Reading for the Young.

THAT BROTHER OF MINE;

Or, Horticulture Indoors, Spiced.

BY MRS. M. L. S.

"Bliss, can you spell excellency with four letters and yet there will be 140 in it?" said Will—with a look of surprise at his own ingenuity.

"Oh! what do I care for your quibbles and quizzes!" replied Bliss; "go get me those sticks and hoop wires for making the frame for the ivy which has taken root in this pot."

"Well, Miss 'busybody,' look this way;" and Will held up a card with X L N C written upon it, in bold capital letters.

"Oh! yes," said Bliss; "that's as plain as A B C; only four letters, and XL make forty, and C, one hundred. Now, that I have solved your puzzle, get the things, please, and I'll make you a puzzle."

"Yes, so could a fellow make an egg stand on the end after it had been cracked a little. Very easy, indeed. But Bliss is going to make me a puzzle. Won't it be a stunner!" And suiting the action to the word, he came down so heavily on the table with his fist that the pot of Ivy rolled to the floor.

Bliss jumped to her feet, exclaiming, "I didn't mean I'd make you a puzzle, only a frame for your vine; just look! Go bring me that old umbrella frame which you were clapping at the dog yesterday," and her face brightened with a new idea.

Will, feeling just a little uncomfortable over the accident to the plant, scampered off to the garret. Bliss was gathering up the plant and earth when she heard an affected sniffle, and there was Will, in a wide expanding crinoline, with a bonnet-frame on his head, the umbrella frame hoisted, and smelling vigorously at a small brown jug. "How do you like the picture since it has been finished?" said he, simpering.

Bliss, unable to suppress it, broke into a merry laugh as she exclaimed, "What a clown you are, Will."

"Oh, no; only a skeletonized *sweet* William," said he, as he cut some rare capers, imitating a coquette tripping about to show herself to best advantage. At last, catching his foot in the hoop, he fell sprawling to the floor.

"The sweet William is down, too," said Bliss; "I've picked up the Ivy, now let me pick up this sweet *smelling* William—oh! I mean the smelling bottle," and Bliss fairly choked with laughter as he rolled over, all the while getting more tangled up.

"I can work the wires and get out of this cage; I'm not the first fellow caught in such traps," said he, affecting much exhaustion from the struggle.

"Here's your smelling jug, perhaps it will revive you, said Bliss, with mock politeness, holding the jug to his nose.

"*Jug or not*, I can make an Oriental idol to be worshipped as much as a *juggernaut*," said Will.

Bliss brought out her sheet of decalcomanie, and commenced cutting out a pagoda.

"Don't these old Celestials look funny with their toad-stool hats on? See, I have cut out a whole row," said Will, after a time; "you just stick the bulge for a center-piece, and let these crank-eyed fellows be approaching it on each side."

"Now, here is an antique vase with a Chinese group, and all it needs is some of those grasses in yellow, blue, red and green crystals," said Bliss, as she placed it on a bracket. "Now Will, for your old umbrella and hoop skirt."

"You don't want any more *antics*, do you?" and Will looked cunning, as if he would like to repeat his character of a woman.

"No, but hoist the umbrella half way, and hang it up by the handle," said she, assuming a business air as she went to work on the tins which secured the steel to the tapes. After getting one hoop off she began at the hub weaving it in and out about the whalebone ribs of the umbrella, and repeated this till it formed a basket as large as desired, when she finished it with bonnet wire and carried a string from the end of each rib up to the groove in the handle where she secured it. She had been so occupied with her work, she had not noticed Will's absence.

"Good morning, *mees*," said a pinched voice at the door, and looking round she beheld an old woman with what seemed a green velvet bonnet bristling with green plumes, on her head. "Old lady!" said she, "walk in and give me your bonnet." This bonnet proved to be a fine mat of moss and ferns, and she immediately turned it up into her basket and began drawing the fronds through the openings between the wire.

"You came very timely, old lady; for I was just ready for the moss, and now let me see if you have some dirt in that pan under your red shawl."

"I brought this imbrill to keep yer ivy dry," said the crone, for Will had been too often scolded for spilling water when helping to water the basket.

Bliss took the pan of leaf mould, and Will held the ivy while she put the soil around it in the newly made basket. They then dipped it in a tub of water and when done dripping, hung it in the window where the light struggled through the tracery of ferns. "Now the stick, Will," said Bliss, "while we have the hoops out."

"Oh! the *Styx*," said Will. "Paddle your own canoe," and he fled.—To be continued.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I thought I would give a final report of my summer and fall work. The beans did not yield as much this year as they did last, on account of the very dry weather we had all summer. The yield from one-third of an acre this year was four bushels, thus lacking one-half bushel of last year's crop.

My Dolly Dutton corn met with several drawbacks. At first the season was too dry for it, then it grew finely for a while, and Sept. 3rd the ears were full grown and just right for eating, which was eight weeks from the time of planting. A week later five stray calves got into the patch and destroyed nearly all of it, breaking off and leaving on the ground a few ears; I had these cooked and they were especially sweet and delicious

In the latter part of September the calves came again and tore off one good ear which I ripened in the house. I had still left two very small ears, and they ripened naturally Oct. 7; so altogether I shall have enough to start me again next year.

The White Tailed radishes never made flower-stems, but just kept on growing till frost, at which time some of the roots were still edible. They are most remarkable radishes.

My pop-corn was dried by the drouth so that it was almost good for nothing. I got one peck this year where I got five pecks two years ago.

I have had a queer change take place in some Tulip bulbs bought of Vick, in 1873. I ordered three single early Tulips, and the first year they all flowered and produced single flowers; the next year I had an increase of two or three bulbs that flowered with the first lot, but one produced double flowers, and has continued to do so since, and to produce more bulbs, which also have double flowers. They have increased very rapidly. I have now over ninety flowering bulbs. Can you explain this change? Last fall I bought another lot of bulbs, one double and several single. This is the first double Tulip I have ordered.

I received the grape seed a long time ago, planted them as you directed, and am waiting for them to sprout. Yours truly,

Dodge Co., Neb. WM. J. MASON.

[This, on the whole, is a very good report. It shows industry and some sagacity on the part of the cultivator. The most interesting point is, perhaps, his observation in regard to the Tulips, and I hope other members of the club will try their skill in producing double flowers. It would be well to observe if the double flowers are of the same size as the single ones, and if they still retain the same shade of color as the mother bulbs had. The soil will influence the color of some flowers, as of the Hydrangia, for instance, which will change from a pinkish to a bluish shade when the plants grow in a soil containing iron, and it might be that a change from single to double might have a similar effect on the Tulip. To give the reason for this change from single to double is no easy matter. We only know that cultivated plants frequently do this, and sometimes, when the plants that thus change grow under peculiar circumstances, as in a dry soil, or a poor soil, etc, people are very apt to say that these circumstances are the cause of the change, but this may not always be true.—Uncle Mark.]

DEAR UNCLE MARK AND RURAL COUSINS: Some time ago Lenora Wire spoke of an orange tree. I have an orange tree that is two years old Will it bear fruit without grafting in this climate? Cousins, I must tell you of our duck. My brother was working near the lake one day, and he caught a young gray duck, and I brought it to the house and put it in a pen where it lived till it was nearly full grown. It became quite tame. It would walk around with the other fowls, but one night my brother took it out of the pen to show it to some friends, he set it down on the ground, it walked a few steps, went quack quack, flapped its wings and flew away in the dark. We thought we should never see little duckey again, but the next day I was over to the lake, and there was duckey with a large flock of companions, as happy as could be; at sight of me they flew to another and larger lake. One evening last fall, just before an awful thunder shower, little duckey came and alighted in our door yard as though it was afraid of the storm, but on trying to catch it, it flew away to the lakes again. The next day my brother went over to the lake and got it; it stayed with us two or three days then wandered off again and we have not seen it since. Uncle Mark, please don't scold at this long letter. WILD TOM.

Chelsea, Michigan.

[Oh, no, Tommy, I never scold anybody for writing long letters, in fact I like long letters, *provided they are well written and sprightly;* but I have one objection to make and that is in regard to your adopted name, "Wild Tom," is not a handsome name, and I feel also safe in saying that it is not expressive of your character, for a really wild boy would care nothing for gardening. I would suggest that the cousins select handsome *noms de plume* when they do not wish to sign their own names. Sometimes the name alone will cause people to be prejudiced against or in favor of a person of whom they otherwise know nothing.—UNCLE MARK.]

DEAR UNCLE MARK:—I see so many joining the Horticultural Club that I thought I would join too, if there is still room. I had no vegetable garden last summer, but I had a flower garden and a small bed of Ground Cherries. I have a few house plants of which I will tell the names. They are: Fuchsias, Geraniums, Jerusalem cherries and a Calla-lily. My father is in the nursery business on the Yaquina Bay. My mother has a Tallow Tree that does not bloom. It is not very old. Does it require any special treatment? I would also like to know how to raise Fuchsias from seed. I guess I have written a long enough letter for this time so good-bye. ELLA BRIGGS.

Benton Co., Oregon.

[The Tallow Tree (Stillengia sebifera) is a Chinese tree, which, however, has been naturalized in Florida and other Southern States, and does not require any *special* treatment except to have protection in cold weather. In China it grows from 30 to 40 feet high; it has long flexible branches and long stalked leaves much resembling those of the Poplar. The flowers appear in dense spikes at the ends of the branches. It is called the Tallow Tree because of a tallow like coating which envelops the seeds. This is used for candles by the Chinese.—U. M.]

DEAR UNCLE MARK:—Fearing you will think that I have deserted you, I will write you again and tell you how I am enjoying myself. I am so sorry the flowers are all gone, I miss them very much. My bed looks so bleak and cheerless when there are no plants in it. But winter also has its pleasures; I find it very cheerful. I have nice books, and read nearly all day. I received a good many Christmas presents, but of all I prize my books the most; for you know I am a great reader, and if I could not have books to read, I do not know what I would do. Last fall some girls gave me some seeds which I will save for my garden for next year I am going to make some improvements in my garden next summer, and I hope I shall succeed in making it look pretty. But I must close, as I have already written a long letter.

Yours LIZZIE E. BLAIR.

P. S.—What is the matter with the old members of the Horticultural Club, and all the cousins, since they don't write? I send my regards to them all; and I want them to write and tell us how they spent Christmas and how they enjoy the winter. L. E. B.

New York City.

DEAR UNCLE MARK:—I have been thinking of joining the Club for a long time. I live up in the northern part of Michigan where the winters are long and the snow gets very deep. I am only seven years old and six years of my life I have spent here on my papa's homestead. I don't go to school but mama has been teaching me to write, but I can't write good enough yet to write this letter, so papa is writing it for me.

I had a little garden last summer, but it did not do well. I hope to have a better one next summer and wish you to please send me some flower seeds suited to this northern climate, that will blossom next summer. I have a Geranium and a Pink which blossomed this year, that I am wintering in the house. I have twin sisters three years old and a brother five years old. Please put my name on your list. BERTHA E. SMITH.

Otsego Co., Mich.

PERSONAL ITEMS.

General Sherman's Christmas present was a fourth grandchild, born at St. Louis.

Mrs. Kate Chase Sprague has rented a Washington house that formerly belonged to Senator Sargent.

Richard Wagner, the eminent composer, is reported to be so seriously ill that little hope is entertained of his recovery.

New Jersey, small as she is, is great in Presidential timber. McClellan, Parker and Randolph are in the field, with the back counties to be heard from.

General Grant, when asked which city among all he had visited he liked the best, answered quickly:—"Washington; I think it is the handsomest city in the world."

General Grant is the first ex-President who has visited the upper part of South Carolina since Washington passed through in his private carriage in the year 1797.

The Portuguese Minister at Washington is preparing for his government a report on the public schools of the United States. He considers ours the most admirable system in the world.

Baron Gustave de Rothschild, of Paris, has just bought a $400,000 house that adjoins his own mansion on the Avenue Marigny that he may pull the former down and thus enlarge his lawn somewhat.

Sir Cresswell Cresswell, late Divorce Judge in London, observed that the feminine petitioners in his court nearly always were blue-eyed, while the naughty respondents almost always were light-gray or black-eyed.

The Rev. John G. Brady, who has returned from a stay of two years in Alaska, says that the natives have learned how to make "a ruinous intoxicating liquor" from molasses, and they drink so much of it that alcoholism is a common disease there.

Frank Buckland has been visiting Abbottsford, and finds Scott's study left precisely as it was in his time. The place now belongs to Sir Walter's great-granddaughter, who is a Roman Catholic and married to Mr. Maxwell, son of Lord Herries.

Ex-Controller Connolly, of New York, one of the Tweed crowd, now a fugitive from justice, has recently made three millions in New York speculations. His son-in-law conducted the business. This is not generally the way of the transgressor.

Charles Morgan, the steamboat millionaire owner of the Morgan line of N. O. steamers, and the Morgan Louisiana R. R., who died leaving an estate valued at $12,000,000, willed that all his property should be distributed among his heirs as the laws of New York provided. Several of the grandchildren contested the will on the ground that they would not receive their pro-rata share, as certain other heirs had received advances previous to the death of the deceased. Lately the contestants withdrew their objection to probating the will.

The Countess of Girgente (Princess of Asturias) has always attended to the education of her younger sisters, who are handsome and accomplished, and has always been the prompter and mentor of her brother, King Alphonso, whom she habitually accompanied, before his first marriage, to the church, the theatre, the Prado, and the arena. On the wedding day she drove to the Atocha with Queen Isabella and her two younger sisters. She has given up her apartments in the Alcazar Real to the Queen mother, and accorded her precedence at all state festivities.

Mayor Leone, of Monrovia, Liberia, prints the following advertisement in a local newspaper: "Municipal Notice.—Whereas, There has been a great laxity in observing the law providing that all persons coming into the city of Monrovia be clothed, this is to require all magistrates and conservators of the peace to immediately proceed to its rigid enforcement twenty days from the date hereof. Pantaloons reaching to the knee and native shirts or loose gowns are to be considered sufficient clothing within the meaning of the ordinance."

The weakest woman, smallest child, and sickest invalid, can use Hop Bitters with safety and great good

AGRICULTURAL NEWS.

Out in Iowa a new departure in creameries seems to be under way—the cream instead of the milk is collected and taken to the creamery—less work and freight, and a saving of the skimmed milk to the farmer. . . Suits have been begun against several retail dealers in this city for selling oleomargerine for butter. . . Two of the chief dailies of this city have been indicted for publishing lottery advertisements—oh, yes, this is agricultural news, inasmuch as it should open the eyes of some farmers. . . Twenty-eight States have now duly appointed Fish Commissioners. . . A farmers' lecture course begins at the State University, Columbus, Ohio, on Tuesday, Jan. 13, and will continue three weeks. All who want to attend should send for information to the University . . Through the untiring efforts of one of the best of Secretaries, the New Jersey State Hort. Society promises to hold a very lively and interesting meeting on the 15th and 16th inst., in Park Hall, Newark. A cordial invitation is extended to all. The total catch of menhaden by the fishermen of Greenpoint, Long Island, during the past year was 211,000,000; gallons of oil rendered, 1,013,350; tons of scrap made for fertilizing purposes, 22,100. Other points not heard from. . . No clearances are granted to vessels carrying neat cattle and sheep from this port unless each animal has been pronounced healty by duly qualified inspectors. . . A large number of fights have occurred in Chicago between the Union and non-Union men, the former being always the aggressors, as they object to the action of the latter in taking their places. The packers refuse to take any of the strikers back unless they quit the Union. . . The Jersey Cattle Club propose to exclude from the Herd Register in future the "very questionable importations of the dealers"—that is of the Fowlers. . . West Va. is about to form a State Wool Growers' Association. . . The Seventh annual session of the N. Y. State Grange will be held at Rochester, beginning Jan. 27. . . On Wednesday, Jan. 7, Senator Windom submitted to the Senate a resolution calling on the Committee on Appropriations to consider the expediency of establishing an additional executive department of the government, to be called "the Department of Agriculture and Commerce," which shall embrace in its jurisdiction agriculture, domestic and foreign commerce, manufactures, mines and mining, public lands, geological and other surveys and railroad statistics, and that said committee report its conclusions by bill or otherwise. Ordered to be laid on the table. Subsequently Mr. Davis, of West Virgina, introduced a bill to establish a Department of Agriculture and Commerce, which was laid on the table, subject to his call. . . On the same day a vote was taken on Produce Exchange here on the question whether the adoption of the cental system should be indefinitely postponed. There were 771 votes in favor of postponement, and 168 against it. Grain and provision members jubilant. No cental system until Congress enacts uniformity. . . From a correspondent in Hocensack, Lehigh Co., Pa., we learn Mr. C. Krauss, a well-to-do farmer, who had a large stock of milch cows and young cattle, and some Jerseys, last fall bought a heifer for winter beef from a drover from the Philadelphia cattle market. After a time the new-comer showed signs of pleuro-pneumonia, and so did most of the other cattle. A veterinary surgeon was called in who pronounced the disease decidedly pleuro-pneumonia, and ordered the affected animals to be killed. Thirteen fine animals had already been killed at the date of writing and seven more were to be slaughtered right-away by order of the State Inspectors. . . The California orange crop, it is said, is not so large this year as last, but the fruit is finer. . . Arizona has a new market for the fruit growers of Southern California; for the miners who are thronging hither are hungry for fruit, and no orchards there are yet in bearing. . . Floods, greatly damaged the country around Grand Rapids, Mich., on Tuesday the 7th. . . On same day Mr. Davis, of Ill., introduced a bill into the House to admit free of duty articles intended for the exhibition of the Millers' International Exhibition, to be held at Cincinnati in June '80. . . The eleventh winter meeting of the Vermont Dairymen's Association, will be held at Brandon, Jan. 21st, 22d, and 23d. . . The waters of the River Vistula are so high that 20 villages in the Crawcon district have been submerged. . . The Prussian Financial Minister says that 106,000 people need public aid in Upper Silesia, owing to short crops. . . That Maine sugar-beet factory doesn't seem to "pan out" well. . . The French legislature has passed an act making agriculture one of the regular studies in the public schools. . . Call you this winter? It's spring-like hereabouts. . . That pleuro-pneumonia at Haverhill, N. H., turns out to be of a mild, con-contagious form, by last reports. . . The Annual Meeting of the N. H. State Ag. Society will be held at Manchester, Jan. 31st. The receipts of the last N. H. State Fair were $7,536 77; expenses, $6,753.95. . . Bishop Ireland is said to have secured 45,000 acres in Lyon Co., Minn., for a Roman Catholic colony. . . By the laws of Iowa, aliens, whether they reside in the United States or not, may acquire, hold or transmit property. In New York they must obtain a special act of the Legislature to enable them to do this. Query: Does not New York drive away many moneyed Scotch and English by this enactment? In England an American can hold any land he likes and buys.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness

BRIEFLETS.

Mr. Meehan says that lumps of tow dipped in gas tar and placed in the runs, will drive moles away. . . We request our readers to send us by postal, or otherwise, any change in crop prospects, or any items of agricultural or horticultural news which may occur in their sections of country. We shall thus be enabled to add to the value of our "Everywhere" Department. . . T. H. Hoskins, M. D., of Newport, Vermont, pays the Rural a valued compliment. It is as follows: "I congratulate you on the prosperity of the Rural New-Yorker. It deserves it and more, and if you go on with your work, you will make it the best paper of its class in the world. I think it is about that now—yet no doubt you can advance it even beyond where it now stands."—We shall certainly try. . . . . Speaking of sweet potatoes, a correspondent of the London Garden says: "When good, it turns out something between a sweetmeat and a vegetable. I do not know if their price is high in America, but it would be a great boon if they could be sent here in such quantities as would allow of their being used as food. At present they are merely Covent Garden curiosities." . . We cannot find the slightest real evidence that the use of iron will prevent the cracking of pears. . . Our crop reports have shown that corn has ripened very imperfectly over large areas of the country, owing to various causes. Nevertheless, the yield seems to be upwards of 150,000,000 of bushels greater than ever before. . . Domestic Economy.—If you are blest with a large family, and have, besides, numerous relations whom you don't wish to disoblige, always dress yourself and household in black; and thus you will escape the expense of mourning.—Punch. . . The prosperity of agriculture is inseparable from the prosperity of other great industries of the country. . . A thorn in the bush is worth two in the hand. Punch. . . Too many broths spoil the cook. . . One good kiss deserves another. . . Confidentially to our lady readers—Lace in haste and lament at leisure. . . . . The Duchess of Oldenburgh and Red Astrachan Apples for Illinois, ... When the printed address on the Rural has no number attached, the subscription expires at the end of the year. . . Thanks to a California friend for the little box of S. American corn. . , Remarkable specimens of fruits, roots, tubers, corn, wheat—grain of any kind—are thankfully received. They sometimes furnish us with the subjects for engravings. We are always glad to bear the expense of postage on such articles if notified by postal card or otherwise. . . The mistaken notion prevails with some sportsmen that the signboards forbidding hunting, fishing or trespassing on private lands are of no account, and that they can be disregarded with impunity.—Center Democrat.—They are very often regarded as excellent for target practice. . . Alonzo Sessions says: "If animals become diseased, I should prefer to see them slaughtered promptly rather than tortured to death with drugs" . . Says the N. Y. Tribune in a thoughtful editorial: "Much of the misfortune of all classes comes from inability to hold a level head in a season of sudden prosperity. Farmers, go steady! and prove, as usual, the balance-wheel of the world's industrial machine. . . People with corns should never kick. . . When the wine comes in, the ladies walk ont. . . "Did the Dairy Fair pay?" N. Y. Tribune. The International? Why, yes—certainly, of course—that is—but why do you ask the question? . . In preparing ground for vegetables as the season permits, spare not the manure. It is penny wise and pound foolish. Remember that the excellence of vegetables depends upon their rapid and luxuriant growth. . . No just reason has been assigned why the Agricultural Department should not have a representative in the Cabinet. Journal of Agriculture. . . Mrs. Maple, who is *very* stout, says there is no waste (waist) in *her* kitchen. . . *Virtus semper viridis*—A young man from the country. . . There is no happiness which will compare with that which comes to a man whose bills are all honestly paid. . . The little girl was quite right who said she had been converted, and knew it because she felt all the time like giving the best things she had to her sister. A little more of that kind of conversion would do older people no harm. . . "The London Garden of Dec. 6 contains a very excellent portrait of Hon. Marshall P. Wilder." Mass. Ploughman. Why not have said, friend Ploughman, that it was copied from the Rural New-Yorker with due credit? . . We beg to thank our subscribers for their efforts and good words in our behalf. In a great measure we owe our increase in circulation over last year to them. . . Trouble is as easily borrowed as an umbrella; but not so easily lost. Never be a borrower of either.

PIGGY, PIGGIER, PIGGIEST.

Poking Fun at Darwin's Origin of Man.

A Medicine Should not be Guaged

By the suddenness and violence of its effects. Self-evident as this proposition would seem, there are many foolish persons who are content only with a remedy which acts abruptly. The pill and other nostrum-vendors who trade upon the credulity of this class, find their "best holt," as poor Artemus Ward termed it, in the sale of violent purgatives. So long as they wrench the bowels of their dupes sufficiently, they are pretty sure of a certain measure of success. If instead of such pernicious rubbish, Hostetter's Stomach Bitters is used, the results are widely different. The bowels are relieved, but always gently, by this pleasant laxative, which does not weaken but invigorates them, and endows the co-operative organs of digestion and bilious secretion with activity and regularity, strengthens the constitution and physique, and while it is safe in its constituents, is sufficiently prompt in operation.

Arboricultural.

NOTES FROM THE RURAL GROUNDS.

The Tulip Tree. — Liriodendron Tulipifera.

THE Tulip Tree! the Tulip Tree! The queen of our forests for beauty, and yet how rarely seen in ornamental grounds! The conservative Dr. Gray calls it a "most beautiful tree." Hemsley says, "It is one of the noblest hardy trees." A. J. Downing says, "Whoever has once seen the Tulip Tree in a situation where the soil was favorable to its free growth, can never forget it. . . It is in our estimation decidedly the most *stately* tree in North America." And so, through a long list, we could tell our readers of the high estimation in which it is held by those who have made the study of plants an essential part of the work of their lives. There are two erroneous impressions regarding this tree, which, in a great measure, may account for the fact that it is rarely seen about American homes.

One is that as it attains an immense hight in the forest or field, it is not suited to the lawn or home grounds. The other is that it is difficult to transplant successfully. As to the first, it is true that the forest Tulip, towering up to a hight of 100 feet or more, with a naked trunk two-thirds of its hight, does not commend itself as being valuable for purely ornamental purposes. Let us dwell upon this objection for a moment:—Seven years ago, we removed a young tree from a near field and set it within twenty feet of our dwelling. The grounds were new and presented that bleak, bare appearance which makes one wish for the seasons to hasten around, that the growth of trees and shrubs might change this to one of maturity and comfort. The Tulip, therefore, was employed to produce a quick effect. The third year it had made a growth so considerable that we were called upon to decide whether it should be cut back or removed, and the former alternative was adopted. It has been cut back yearly since with the result that we prized it last summer as one of the most beautiful lawn trees we have ever yet set eyes upon. The leaves are twice the size of those which grow in the woods and are perceptibly larger than those which grow upon trees of the same age under cultivation when not cut back. Besides, the annual pruning has forced the growth of many lateral buds which would otherwise have remained dormant, so that the tree from spring till late autumn is a mass of luxuriant foliage which entirely conceals the branches, and is most pleasing in its refreshing shade of green and firmness of texture during summer, and in its golden hues of fall. We are of those who believe that, as a rule, all pruning impairs in a greater or less degree the vigor or longevity of plants, though not, perhaps, appreciably so in many cases. How long our Tulip will remain healthy under this treatment remains to be seen. We are impressed, however, that the development of several branches by pruning, in the place of one branch when the tree is permitted to grow naturally, may change its size from one of the first magnitude with an erect, columnar trunk, to one of comparatively dwarf dimensions; in other words, that the vigor which in the woods is expended in the growth of a colossal main stem, is by cutting back distributed among a greatly increased number of lateral branches and leaves.

THE TULIP TREE—Liriodendron Tulipifera.—From Life.—Fig. 14.

As to the second objection; viz.: that it is difficult to transplant—an objection prominently set forth by most authors—we may say from positive knowledge that it is without foundation in fact. The objections hold good in any attempts to transplant the tree from woods or fields as trees (Maples, *e. g.*) are usually transplanted—that is by a partial cutting back of the branches. To be successful in transplanting the young Tulip, however, not only must the secondary branches be cut back, but the entire stem to within two or three inches of the neck must be cut away so that the roots and neck are all that remain to be transplanted. Thus we have treated a number ourselves; thus we know of hundreds of others being treated with no greater percentage of loss than that which attends the transplantation of the Sugar or Swamp Maple.

The growth is rapid. From roots so removed from their native grounds in the early spring, trees not less than fifteen feet in hight may be counted upon in five years thereafter.

Our engraving of leaf, fruit and blossom is a very faithful portrait drawn from the tree above alluded to, and reduced in size, except the fruit cone which is the average natural size. The flowers appear in early June, and from their resemblance to the Tulip (*Leirion*, a Lily or Tulip), the tree derives its familiar name. They are externally of a greenish color so little removed from that of the leaf, that a tree may pass through its blooming period unknown to those who pass it daily. Nevertheless, the flowers are pretty enough upon examination, being internally of a yellowish color, with a band around the bottom petals, of deep orange.

It is variously called Poplar, White-Wood Tulip Tree, Virginia Poplar, Saddle Tree (from the truncate shape of the leaves), Canoe Wood, etc.

LIRIODENDRON TULIPIFERA.

REV. A. W. MANGUM.

This tree, so wide-spread and well known, is one of the most beautiful and valuable of the products of the American forest, and deserves much higher esteem than it receives. As an ornamental tree, it will compare favorably with the handsomest of our native trees. The trunk is erect and stately, the branches naturally incline to symmetry, the foliage is exceptionally beautiful, the tulip-shaped flowers are fragrant and modestly attractive, and the bright yellow of its autumn garb mingles charmingly with the myriad hues of the fading groves. To those who demand the more practical, its claims are even more potent. Perhaps there is no part of the tree that has not been applied to some special purpose for the benefit of man. It was, perhaps, this variety that was used by the savages to make their "poplar" canoes. The early settlers on the Atlantic coast utilized the tree in various ways. They made of the buds an ointment which they thought to be "excellent good to cure all manner of inflammations, scalds and burns." They learned that "it is very durable and lasting under ground and in the water." They tell us that it "makes handsome wainscot, tables, shingles for houses and planks for several uses."

The bark of the root and even of the branches is still regarded as a tonic. The timber is still noted for its durability. In rails it will last fifty years. The writer is informed of one instance in which it is probable that the rails have lasted over 50 years. Though it is peculiarly sensitive to the effects of moisture, it is much used in building. Being straight, long, durable, and easily hewn, it often takes the place of other timber in the plates, etc., of houses. It is commonly chosen in some localities for troughs in which to feed hogs, cows and horses; and also for the beating of the apples in those places in which there are no cider-mills. Notwithstanding its tendency to swell in damp weather, it is used by us in making furniture. While the young tree furnishes the angler with a light fishing-rod, the bark of the tree has furnished the scholar with paper. The tree sometimes reaches the diameter of nine, ten, and even eleven feet. One tree sometimes yields 10,000 feet of good lumber. From the Report on Forestry, I learn that about 15,000,000 feet of poplar logs are annually floated on the Cumberland to Nashville, Tenn. The comparative rapidity of the growth is a forcible recommendation. Having so many good qualities, it ought surely to be so highly esteemed as to be better protected and more faithfully cultivated.

A RARE ELM.

JAMES HOGG.

Last spring Mr. C. S. Sargent, of the Harvard Arboretum, noticed in Central Park, just south of the entrance at Fifth Avenue and 72d Street, an Elm tree which was entirely different from any species he had hitherto seen. He wrote to me asking if I could identify it or give any history of it. I was not able to identify the species, but was able to give him a short history of it, which I subjoin, as it may be of interest to some of your readers:

About twenty years ago when I was connected with the Central Park as one of the Commissioners, I visited the different nurseries in the neighborhood of the city to inspect their stock of trees and shrubs as a guide to making purchases for the Park. At Mr. Gustin's nursery on the Newark flats, I found an Elm tree which was quite sub-evergreen, with very small, persistent leaves, very thickly set on very short, delicate twigs. Mr. Gustin did not know the name of it, but said that he received it from France. I was much struck with its beauty and ordered some five or six plants, all he had propagated, for the Central Park, and the tree at the 72d St. entrance is one of them, and I believe the only one surviving. Mr. Gustin's nursery has long since been broken up, but the original tree was still growing on the grounds some two or three years ago. Mr. Sargent, this autumn, found another tree of the same species growing in the grounds of the Agricultural Department at Washington, where it was known as Ulmus Siberica, a name not to be found in any book of descriptive botany that either of us is aware of.

FRUIT OF TULIP TREE.—FROM LIFE.—FIG. 15.

He sent a specimen of the tree in the Park to Prof. Oliver, of the Kew Herbarium, who pronounces it to be Ulmus parvifolia. Loudon in his Arboretum Brittanicum, gives it as a variety of Ulmus campestris, and quotes U. microphylla of Persoon and U. pumila of Wildenow as synonyms. Loudon thus described it—"A tree, according to Pallas who mentions several varieties of it, very common in all the woods in the south of Russia, and varying in hight from that of a middle-sized tree to that of a diminutive shrub, according to the soil and climate in which it grows. It is very plentiful about Caucasus; through Siberia, it gradually becomes more scarce; but occurs again about Lake Baikal, where the inhabitants use the leaves as a substitute for tea. In mountain rocks the branches are short and thick; but in sandy soils the trees are small, and the shoots slender."

Persoon described U. microphylla as having small leaves, sharply serrate, nearly equally attenuated at the base, and the branches twiggy. He gives U. pumila *var.* transbaicalensis as a variety with thickly-set lanceolate-ovate leaves like Euphrasia officinalis (Eyebright). He also mentions a variety very similar to the above but somewhat larger in its growth.

LEAF OF ULMUS PARVIFOLIA.—FROM LIFE.—16.

Unlike other Elms which ripen their seeds in June or July, this species does not ripen its seeds until October or November. The seeds on the tree in the Central Park appear to be all abortive this year, but the tree at Washington is producing good seeds. The tree in the Park is about twenty-five feet high, the branches are erect and do not droop at all. It is a very beautiful species and some of our nurserymen should obtain some of the seeds or cions for grafting, and offer it for general cultivation, as it is well worthy of introduction and distribution. I may add that M. Maximowicz and Dr. Savatier have found it in Japan.

Farm Topics.

NOTES FROM THE RURAL EXPERIMENTAL GROUNDS.

Cauliflower.

One of the most prized—and justly so—of all our vegetables is the cauliflower, and it is also one of the most difficult to raise in perfection by those who have not learnt by experience or otherwise of its special needs. A heavy, solid curd, as nearly round as may be, free from protruding leaves and at least a foot in diameter, may be considered the standard of excellence. In Erfurt, cauliflowers are grown in low muck lands, with intervening ditches of water, and even then during dry weather, water from the ditches is thrown over the plants. Water, therefore, is of the first necessity. The best crop we have ever grown here was raised upon rather clayey loam by the free use of manure-water and a frequent stirring of the soil. This sort of cultivation, however, though it may serve well enough for small gardens and amateur gardeners, cannot be followed by the market-gardener with profit.

About the first of February seed should be sown in hot-beds, and as soon as the plants are large enough, they should be transplanted to a cold-frame, where they may remain until the latter part of March, when, in this climate, it is generally safe to plant them in the open ground. If given air freely before transplanting, and protected during cold snaps at night and thus gradually hardened, they will stand as much frost as a cabbage, without injury. It is, we believe, very important that the plants should get established in the field or permanent beds as soon in the spring as possible, since the droughts and heat of early summer are fatal to the formation of fine heads or curds, unless they have had time to form a sufficiency of roots and leaves. Treated in this way, the plants should be ready for market in mid-June, leaving plenty of time to clear and prepare the ground for second crops.

The land for cauliflowers cannot be too well prepared; and manure liberally applied is indispensable. Lime is freely used on Long Island where splendid crops of this delicious vegetable are raised from year to year, though not on the same fields. Superphosphate and guano, at the rate of 300 pounds per acre, more or less according to the home-made manure used, are also applied as a top-dressing and harrowed in. Early Dwarf Erfurt, Early Paris and Lenormand's are as good as any of the dozen varieties offered in catalogues.

Doura.

The Rural New-Yorker has stated in an Editorial Brevity, that it did not know where seeds of this variety of common sorghum (illustrated on first page of issue of Dec. 27th, '79), could be obtained, oblivious to the fact that it was advertised last season in its columns for several weeks by Messrs. R. H. Allen & Co. of 189 and 191 Water St., N. Y. It was through the kindness of one member of that firm that seeds of all the varieties described in the issue above referred to, were sent here to be tested. It is this variety (Doura) about which different accounts disagree as to its forming more than one stalk from a single seed. As previously stated, ours averaged eight or nine stalks that, after being cut on July 10, when they were five feet high, attained the hight of six feet again by the first of October. As previously stated, also, we freely recommend our readers to purchase a few seeds of this sorghum for experiment, as the faith is strong upon us that it may prove of value as a fodder plant.

Weather and Crops.

Wheat with us has never looked finer at this season than now. The remarkable growth of leaves, which it was feared might induce decay, is still beautifully green and fresh, and there is no appearance of the Hessian fly or any other indication that the promise of another grand crop will not be fulfilled. The weather up to to-day (11th) has been soft and the ground, except on the shady side of trees and houses, as open as in early November. Fruit buds were perceptibly swelling, and a few sensitive shrubs began to push their leaves. Last night, however, a brisk frost occurred, and the ground to-day is frozen two inches in depth. It is to be hoped that the cold weather will continue, since this alone can restrain the quickened roots and buds from further action, which, should another warm interval occur, would prove fatal to the fruit crop of the present year.

Some New Light on the Potato-Rot.

For a number of years now, it has been well understood that the "potato-disease" is caused by a parasitic fungus called Phytophtora, (or Perenospora) infestans by botanists which, while feeding upon the substance of the potato-plant, or the tubers, rapidly disorganizes their tissues.

As if this parasite were not, of itself, a sufficiently active enemy, it appears that, in certain cases, the destruction of the tubers is greatly accelerated by bacteria which follow the disease-fungus and feed upon the disorganized tissues which have been made ready for them. Two German observers, Reinke and Berthold, recently set themselves to study the question: Why is it that farmers sometimes distinguish two kinds of potato-rot, viz: wet-rot and dry-rot? Wet-rot may be defined the state when the whole interior of the potato has run down to more or less fluid, filthy pulp, of a very strong and peculiar odor: while the term, dry-rot, is applied to tubers whose substance has been changed to a loose, spongy mass which feels dry, and which, when cut across, presents a marbled appearance. Dry-rotten potatoes are always covered, sooner or later, with mold; while upon the surface of wet-rotten potatoes there may be either no mold or, more commonly, only occasional patches of it. Dry-rot rarely occurs unless the wet-rot has preceded it.

Both dry and wet-rot may follow the attack of the potato-rot fungus proper (Phytophtora), and be promoted by it, but it appears that the wet-rot is not solely due to the Phytophtora. Thus much is shown by the fact that tubers which have never been attacked by that fungus may still be destroyed by wet-rot. In experiments where potatoes infected with Phytophtora were kept moist, they quickly passed into the wet-rotten condition; but it was observed that simultaneously with the first symptoms of the wet-rot, bacteria made their appearance in the rotting tissues. Furthermore, on wounding some sound potatoes which were perfectly free from Phytophtora, and placing upon the wounds some of the liquid charged with bacteria taken from a wet-rotten potato, taking care meanwhile to keep the tubers moist enough that the wound should not become dry, it was easy to start local patches of the wet-rot; and it often happened that the inoculated tubers quickly became rotten through and through.

The experimenters were thus led to the conviction that the bacteria and the fermentations due to their presence, are the immediate cause of the wet-rot; and that the actual harm done by the potato-disease fungus (Phytophtora) is chiefly in preparing the way for the bacteria, by disorganizing the tissues of the tubers and bringing them into such a condition that the decomposing action of the bacteria is peculiarly rapid.

The predisposing influence of the Phytophtora is so well marked that in experiments where potatoes infected with this fungus were inoculated with the liquid from wet-rotten potatoes, it was found that the wet-rot often ran its course, even in those cases where no pains had been taken to hinder the wounds from drying. On the other hand, in the experiments upon potatoes free from Phytophtora, it appeared. In some cases, that the progress of the local patches of wet-rot produced by inoculation, was checked by the formation of a cork-like layer in the sound part of the tuber, in the vicinity of the rotting place. This cork layer hindered the bacteria from penetrating, and protected the potato from further decay. It appeared, furthermore, that potatoes suffering from the disease caused by Phytophtora have no power to produce this protective layer of cork. The natural skin of the potato, like the cork layer just mentioned, is an efficient protection against the bacteria which cause wet-rot, so long as it is neither cracked nor broken at any point.

Considerable differences were noticed in different potatoes, all equally free from Phytophtora, in respect to their power of resisting decay. Some tubers were completely changed to rotten pulp in the course of two days after having been inoculated upon a wound, while in other cases the formation of a cork layer in the substance of the potato, fenced off, as it were, the wet-rotten place from the sound portion, and restricted the bacteria to narrow limits. In general, potatoes completely ripened in autumn and rich in starch best resisted the progress of the decay. The practical lesson taught by these experiments is the old one that excessive moisture must be avoided, if potatoes are to be kept free from rot. Undue wetness of the soil, or stagnant water on the soil, will promote the growth of the bacteria, as well as of the Phytophtora. The soil on which potatoes are grown should not only be well drained in the ordinary sense of the word, but provision should be made, in special instances, to carry off surface water in cases where heavy or long-continued rain might do harm.

Other things being equal, the presence of a large proportion of organic matter in the soil will favor the development of bacteria; and the danger would be increased if the land were heavily manured with dung or stable-manure. The experience of practical men accords with the conclusion of the experimenters, that in order to protect stored potatoes from wet-rot, all diseased specimens should be picked out a

the time of digging, that the tubers should be harvested as dry as possible and afterwards kept in a dry place.

As regards the utilizing of potatoes when the wet-rot has appeared among them, the authors urge that by rapidly drying potatoes thus affected, the starch in them may be saved; that is, the most valuable ingredient of the tubers.

Farm Economy.

ON FENCES.

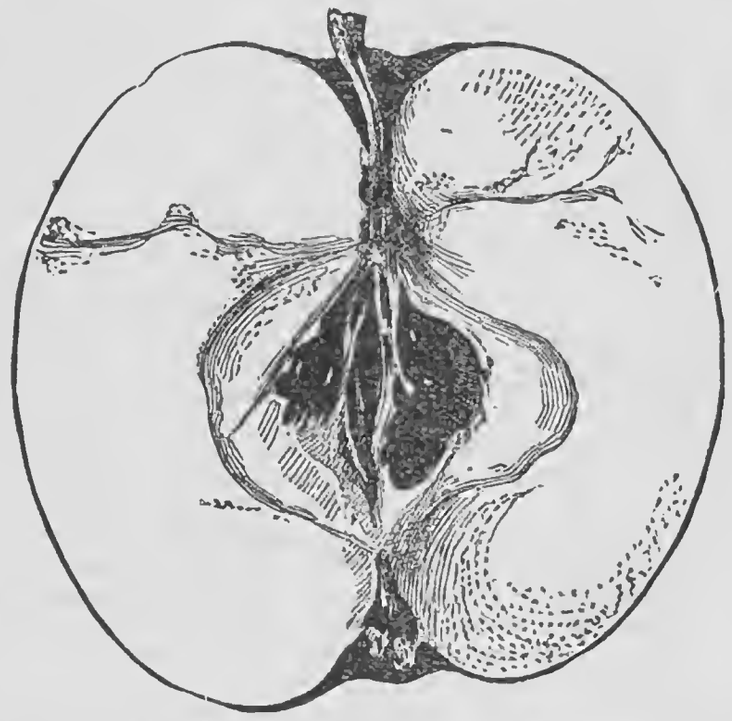
H. L. WYSOR.

THE RURAL'S leader in the issue for Dec. 6, on Highway Fences, contains many pertinent and suggestive questions, of which some, as the writer truly states, are more easily asked than answered. As to the question whether there should be any road-fences at all, it would seem for many prudential considerations, which will suggest themselves to any one who considers the subject, that it is to the interest of the farmer that these should be kept up. Whether he should build and keep up all of these fences, or only part of them, or no part of them, is quite a different matter. It is to be remembered, however, that in most cases the law allows him, or at least intends to allow him, damages sufficient to cover the cost of once building his highway fences. But is there not more material used in the construction of these fences than would be at all necessary if it were not for certain kinds of stock using the highway as a public common? A fence to keep out pigs would require just twice as much material as one that would keep out cattle and horses, and, of course, it would cost in the same proportion. If it were designed, for instance, to construct a board or a wire fence, two or at most three boards or wires to the panel would be amply sufficient against cattle and horses, but against pigs five would be needed.

Now, a man can, if he chooses, keep his own swine where they will not annoy him; but, unless there is a law to protect him, he cannot keep those of other people out of the roadway. It seems reasonable that the law should require every man to keep his own stock within his own limits, leaving him at liberty to do so in whatever manner he may think proper—by building fences, by soiling, or by herding, as he may choose. This, in brief, is actually the law in some of our States. In others, as here in Virginia, the law requires farmers to keep their highway fences and those between themselves and their neighbors of a certain hight, which varies in different places. Here it is five feet. The result of this law is that persons who either own no land whatever or else keep what they have under the plow, make use of the public road as a pasture on which they turn their milch cows and other stock, which are a constant source of annoyance both to those who travel the road and to the farmers who live along the line of it. There have been instances in which farmers have knowingly overstocked their pastures, and when all the grass was consumed, have turned their stock out in a body to graze on the highway. Yet, so far as is known to the writer, the law does not even pronounce these things to be nuisances; at any rate it does not forbid that the highway should be made use of in this manner.

After all, however, the farmer could well afford to keep up his road fences, if there were not so many other fences besides, which constantly demand his time and attention. It is the object of this article to inquire whether there are not more of these other fences than there ought to be, and to suggest ways in which a great part of them may be dispensed with. Before quitting the subject of highways, it is proper to remark that they should always, wherever it is practicable, be laid off on the division lines between neighboring farms, so that one man may not have all the burden of keeping up the fences on both sides of the lane. In a level or a prairie country this is generally very easily done, especially where the land is laid off in sections and parts of sections. In a broken country, it may be a matter of some difficulty. In any case, the interests of individual farmers should be consulted as well as those of the public, and where they conflict, some sort of a compromise ought to be made. A road ought always to be so located that it will occasion the land-owner the least possible injury and cause the least amount of fencing to be done, while at the same time its grade should be easy and its situation such as not to make it too difficult to be kept in repair. A road should never run for any great distance parallel with a stream of water which is necessary for the use of the stock on a farm, nor should it be so situated as to cut off any large proportion of a place from water. I know farms of which four-fifths are deprived of water in this way. Want of water is more frequently the cause of breachy cattle than anything else, and the best of fences will give way before the assaults of a thirsty ox.

It has been often asserted—and no doubt truly—that the value of all fencing in the United States, together with the annual cost of keeping it in repair, amounts to more than the sum of our public debt. Unquestionably,



SECTIONAL VIEW OF MAGOG RED STREAK.—FROM NATURE.—FIG. 17.

this item of fencing is a heavy burden upon the farmer, and one that tends greatly to diminish the profits of his farm. How this burden may be brought within more reasonable limits is a question which merits our serious consideration. In view of the fact that the time is rapidly approaching when timber, even in the best wooded districts, will have become too valuable to be used for purposes of fencing, it becomes us to inquire how the annual destruction and waste of trees may be largely reduced. Already iron and steel are coming into use in place of wood for this purpose, but these are too expensive to be used in keeping up fences as they are now kept. Let us see, then, what can be done.

In the first place, some disposition must be made of the hogs; as has already been said, they cause more fencing than all the other stock put together. Let the farmers in those States where such laws do not already exist, urge upon their legislatures the necessity of passing such as will restrain swine and other stock from running in the public roads, under the penalty of being taken up as estrays and impounded. Then, let every farmer keep his own hogs either in pens built in his barnyard, or in a lot cut off especially for them. There is certainly no need of allowing hogs to run all over the farm; for unless their noses are rightly cut—which is a barbarous thing to do—or rings are used—which more often than otherwise do not serve their purpose—all the grass is rooted up and destroyed.

The practice of soiling will occur to many as a good way in which to save a vast amount of fencing. Knowing nothing of the merits of this system, I pass it by with the remark that it would be adapted only to such places as are level or only moderately rolling, since the labor and expense of getting green food from steep hillsides would be too great to make it profitable, and in many cases it would be altogether impracticable.

A division of the farm into arable land and pasture land comes next for consideration. Under our present system of agriculture, it is necessary for the purposes of rotation to keep the farm divided into a number of fields, small or large, according to the size of the farm itself, which are separated by cross fences. If the divison above proposed were adopted, only one cross fence would be needed. Precisely how this division should be made—how many acres ought to be included in the arable side and how many in the pasture land—would depend upon quite a variety of circumstances, such, for instance, as the size and situation of the farm, water, etc. Of course, the arable land—within which should be included the meadow—should be sufficiently large for all the grain and hay needed on the place to be grown on it. To illustrate: I know a place which consists of 240 acres. Of these, 200 are hills and woodland, the other 40 are river bottom. Between the 200 and the 40 runs the public road. As the 200 acres are composed of hills, they should be kept permanently in grass and be grazed by calves or yearlings, since heavier cattle could not be kept on such land. Of the 40 acres, 10 should be cut off as pasture for the horses and milch cows needed on the place, which, in this case, would not be more than two of each kind. The remaining 30 acres should contain the garden, orchard and the land to be kept under the plow. In no case, when a good sod has once formed on a steep hillside, should a plow ever touch it, for one heavy rain-storm may wash away more soil than can be put back in a life-time. How grass may be renewed without the use of the plow when it begins to fail or has run out, will be a matter for another article.

The failure of the grass on the pasture land would be the principal objection to this system. All the manure saved in the barn-yard—and this would be large in quantity if the stock were kept in the barn during the winter—and all the commercial fertilizers purchased, must be applied annually on the arable part, which must be kept in the highest possible condition.

Let us suppose another case, and say that a farm is composed of 100 acres level or gently rolling. Let 65 acres be devoted to pasture; then there will be 10 acres for meadow; 10 each for wheat and corn, used alternately—the 10 which are in wheat one year being planted in corn the next, and *vice versa*—and five for garden and orchard; all these together will comprise the arable land. In this manner the right sort of a division, such as is suited to his circumstances and surroundings, will occur to any farmer who gives the subject a thought. In support of this plan, it is worthy of notice that it is now the practice of the best graziers in this country, to give their cattle, when these are first turned out to pasture in the spring, all the range which they intend for them to have during the season. It is alleged that the cattle are more quiet and contented in this way than when they are turned into fresh fields at intervals. All the cross fences between the different pasture fields are laid down in places, so that the cattle can pass from one field into another.

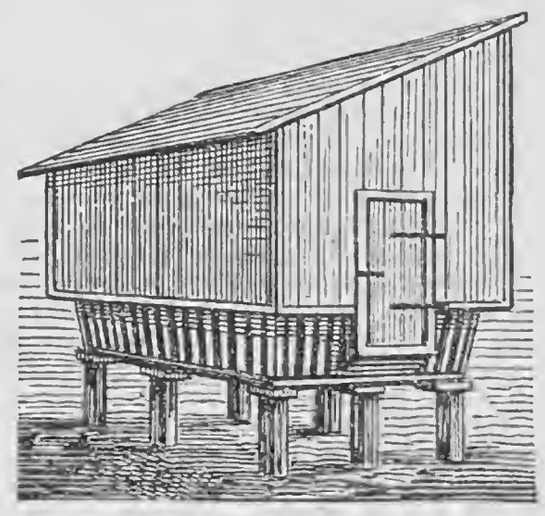
Finally, where the farm is adapted to such a purpose, cattle may be fattened in winter, and none kept on the place in summer at all. Here, there would be no need of any division. The whole farm, except so much of it as would be required to supply the cattle with grain, would be mown. Cattle of the necessary size and weight should be bought in November and sold in April, having been thoroughly fattened in the interval. This plan, like that of soiling, would be suited to places that are level but badly watered. The advantages to be secured in this way, besides the item of fence saving, are apparent. A better price would be obtained for the cattle in the spring than in the fall. The manures from the grain fed being richer in all the elements of plant food, would probably more than pay for the expense of feeding the cattle, and the land would not be tramped to death in wet weather.

I have said nothing in this article about sheep, because they cannot be kept long on the same range. Those who wish to keep sheep must make up their minds to keep up division fences between their small fields, or else to employ hurdles or movable fences. Sheep must be frequently changed from one pasture into another, otherwise they will soon become diseased beyond remedy.

Pulaski Co., Va.

AN "OVERSKIRT" ON THE CORN-CRIB.

A YEAR ago last October I built me a corn crib. During the fall, after it was filled with corn, the strong southeasterly winds drove in the rain, and wet the corn pretty thoroughly. This dried off, however. Later, the northwest winds filled all the crevices between the ears with snow. Luckily we had no thaws all winter; but when, in February, the crib was resorted to for corn to be taken to mill, the ears on the westerly side were as closely packed in frozen snow as eggs in bran. In handling and shelling, a good deal of this came off, but there was also a good deal in the shelled corn, and when this was ground the meal was sensibly damp from it.



OVERSKIRT FOR CORN CRIB.—FIG. 19.

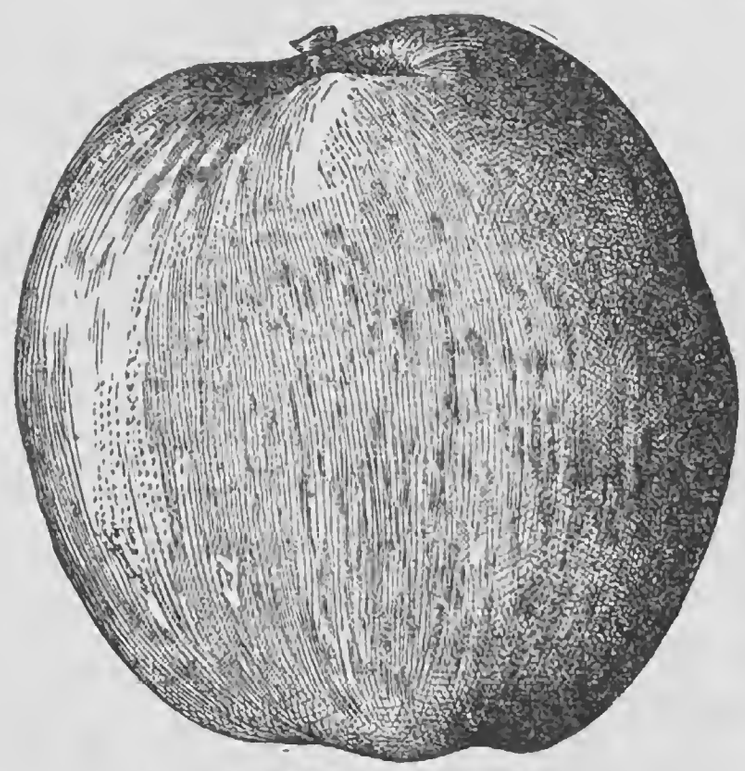
This year I resolved to make an improvement, and have clothed my crib in an overskirt of half-inch boards, as shown in the sketch. It keeps out rain and snow perfectly, and gives, what I did not expect, a stronger draft of air through the corn than before. The corn was not so well dried before husking this year, as it was in 1878, but it has dried out completely in the crib. The first grist was taken to mill in November, and was in excellent condition for grinding. T. H. H.

Pomological.

THE MAGOG RED STREAK.

THIS apple originated as a seedling on the farm of William Warren, in the town of Newport, Vt., on the west shore of Lake Memphremagog, near the Canada line. Within the last ten or twelve years it has been quite widely distributed, and is reported as succeeding well in Northern Maine, Lower Canada, Wisconsin, Minnesota and Iowa. The last report of the Iowa Horticultural Society speaks of it as "the beautiful Magog Red Streak," and the secretary, Prof. Budd, of the State Agl. Col., thinks it a very promising sort, especially for the colder parts of the State. The writer was the first to propagate it, and has now a considerable number of trees in bearing. He finds them extremely thrifty in growth, perfectly hardy, early, regular and good bearers. Trees 12 years planted, give a yield of 1⅓ to 2½ barrels of merchantable fruit.

The Magog Red Streak is roundish, approaching ovate in form; medium to large in size. yellow in color, with more or less streaks of red, especially on the exposed side; mild subacid in flavor; good to very good in quality. Flesh yellow and fine-grained; core, medium. Keeps through March, and sometimes longer. Though not so conical and never ribbed, the general appearance of the apple is like that of the Yellow Bellflower, but with red stripes on its sunny side. T. H. HOSKINS, M. D



MAGOG RED STREAK.—FROM NATURE.—FIG. 18.

THE HOWELL PEAR.

"A correspondent, 'W. H. W.,' writes about the Howell Pear in the RURAL NEW-YORKER, and accompanies his communication with a section 'cut' of the pear. What he says of the quality and productiveness of the pear is correct—it being a handsome, good-sized and popular fruit of third or fourth-rate grade. But as to the 'cut,' we don't know where the writer gets it from, as it represents an old Windsor or Bartlett pear, but most assuredly not the Howell as we raise it and as Downing represents it. Probably it is used as a Boston agricultural paper did the engraving of a cow, which was made to answer for all breeds."

Our respected friend, the editor of the Germantown Telegraph, is entirely mistaken in the above remarks. "W. H. W." did not write about the Howell Pear at all. Those initials were under an article called "Kerosene on Trees," and another article, by T. F. Forfar, on "Pruning," intervened between it and the article on the Howell Pear, which was presented editorally. The cut was drawn by C. Habkemeir from a specimen grown on quince stock in the "Rural Grounds," and is an accurate outline. The tree was purchased *about* four years ago of Ellwanger & Barry, Rochester, New York. The outline is more pyriform and less obovate than the Howell is generally on *pear* stock, a difference often seen in the Duchesse as between standard and dwarf.

It is rated by the American Pomological Society as "very good," which is *second* as regards quality.

SALT AND PEAR BLIGHT.

In answer to S. C. C. F. in RURAL of Jan. 3. I would say that by a "light coat" of wood ashes, salt and bone-dust, as applied to pear trees, I mean just this:—We make a mixture of wood ashes four parts; bone dust, two parts; salt one part, by measure; and apply each year two quarts to each tree. I should not object to twice the quantity, but can hardly afford it. A part of the bone used is the coarse bits sifted out of bone-dust, the pieces being about the size of small kernels of corn, and smaller. These I procured of a crusher here at a low price.

We cultivate soon after applying it. I have no doubt that H., of Ontario Co., N. Y., killed his trees by too free a use of salt. Baked beans are a good and wholesome food, but I knew a man who undoubtedly killed himself eating them. We should use "judgment in all things", even in eating beans. I know, as Mr. Woodruff says, the Duchesse is not very subject to blight; but still it does sometimes blight, and if using salt or "sand" with bone-dust and ashes will save it, then I shall advise its use.

My first experience in using salt was on three large Bartlett trees in a plot where nearly all had previously died with blight. Having some mixture of salt and ashes, equal parts, that had been made for another purpose, two quarts were applied to each tree with marked results, and it has been applied each year since, and those three trees are still alive and thrifty. I don't claim that salt is a specific for the blight; but I do think, if we make the trees as healthy as possible by supplying those elements which they require, we shall be much less likely to lose them by blight. I am well convinced by my own observation as well as by studying the analysis of the Pear, that it requires salt in our inland soils, and just so long as my trees are exempt from serious attacks of blight, I shall continue its use, nor shall I neglect the wood ashes and bone-dust. I use the second quality of salt, buying it by the car-load. It costs but little, and I use it for many crops on the farm, and think it pays me well. I would about as soon my Dwarf Duchesse should blight as to do as Mr. Woodruff says, "let them go to grass"; for, in that case they would only occupy the ground with no profitable results, but if they blighted, I could clean them off and use the land.

Lockport, N. Y. J. S. WOODWARD.

Sheep Husbandry.

SHEEP vs. COWS.

COL. F. D. CURTIS.

Comparative Profits; The Future of Sheep; An Example.

A Rural subscriber has written to us that he thinks that, in our statements of the comparative cost of keeping sheep and cows, in the RURAL of Nov. 22, we did not do full justice to the latter. We think, on the contrary, that we did not do full justice to the sheep when we stated that five coarse-wooled sheep required the same amount of feed as one cow, and that seven medium-wooled, or the same number of fine-wooled sheep, could likewise be kept on the amount of feed necessary for one cow. We have taken the trouble to inquire of several farmers in this vicinity, also subscribers to the RURAL, and they agree with us, without an exception, that we estimated the sheep too low. All of these persons keep sheep as well as cows. Our estimate of 150 pounds of butter to a cow is also too high, as the average yield per cow throughout the State of New York is 115 pounds. Six coarse-wooled sheep to one cow, and eight of medium and of fine wool would be nearer the actual number. The basis of profit is also decidedly in favor of the sheep, as the home market for their productions in wool is not over-done, as is the case with cows, and the foreign market for our woolen manufactures is extending in the most satisfactory manner. It has increased within the last two or three years several millions of dollars. Foreign countries are learning to appreciate the value of the strong and well-made American cloths; besides, it has been demonstrated that, notwithstanding the cheapness of labor on the other side of the ocean, our manufacturers can compete with those abroad, with paying profit. This is because our machinery is now fully equal, if not superior, to the foreign, and the power is largely that of water, which reduces the cost below that of coal and steam.

Our mills are capable of doing a larger percentage of work on the capital invested than the foreign ones, and it only remains for the American farmers to furnish wool enough to supply our mills, to place this important industry upon such a solid basis that it may be entirely a home affair. This is not at present the case, as millions of pounds of wool are annually imported.

It is a fortunate circumstance that there is perfect harmony and unity of action between the woolen manufacturers and wool-growers. The former have always been willing to make all needful concessions in arranging a tariff schedule, so that both these interests could be protected and sustained. They freely express themselves as anxious to foster wool-growing in this country, because they believe that the material for the support of their mills should be drawn from our own land, as this would establish a basis of independence and of substantial prosperity far greater than if such material were brought from other countries. To insure this production, the farmers have only to know that their investments in sheep will pay, as there have been so many fluctuations in this industry, owing to arbitrary changes in the protective duties established by Congress and over-production in manufactures resulting in ruinous losses, that farmers are distrustful in this direction. The woolen interests are now so widespread, covering every portion of our country, that it is doubtful if the people would allow any interference by legislation, which would jeopardize them. The rapidly increasing foreign market, will prevent any glut which will throw back upon the country unsold goods, to break down prices and destroy the industry. Sheep-feeding is not so much affected by droughts and other influences of a similar nature as the dairy.

Our figures, showing the income from sheep were furnished by those who had taken no extra care of their flocks, but whose profits were decidedly satisfactory. Messrs Moorehouse and Classon wintered, last winter, 38 ewes. From them they sold 223 pounds of wool at 33½c. per pound, amounting to $74.70. The 38 ewes produced 49 lambs, of which they sold 36 for $3.25 each, making $117. Thirteen lambs were reserved, for which they had been offered $5 a head, making $65. This would make a total of $256.70. Their sheep are grade South Downs, and were bred from Meriuo ewes. The rams used were nearly full-bred South Downs, but probably contained a portion of Cotswold blood, as the sheep are larger than average South Downs. The income on this flock—rating seven sheep to a cow—would be $46.67. These sheep were not fed any grain, but were wintered on hay. In summer they ran in a back lot where cows would not do well, as the pasture was not rank enough. Mr. Moorehouse has increased his flock for next year to 50 ewes, and will still further increase them, as he is satisfied they will pay better than cows, although his dairy are mostly grade Jerseys, and an excellent lot. This productive flock of sheep have all been bred by Mr. Moorehouse from common grade Merino ewes. He has laid the foundation for a large profit in the future on a small capital. The local butchers are ready to take the lambs as soon as they are old enough, the best ewes being always reserved, and this is the way the flock has been established, and it is the best way.

The Poultry Yard.

WINTER LAYERS.

To obtain a breed of fowls, or rather to breed a flock of fowls, that are constant egg-producers, is the great desideratum. Many fowl-breeders have at one time and another imagined that they have approximated to perfection in this direction. By far a much larger class of fowl-breeders—those who breed to sell—have at one time and another *advertised* that they and they alone had reached perfection in this particular. To obtain fowls that will lay all the time is an impossibility. It is an impossibility to expect fowls to lay for more than a few months at a time, without taking a rest. The frequency of these periods of recuperation and their duration determine to the mind of the breeder the value of the bird. Some breeds will lay but for a short time in the summer, and then the hens take to sitting, and there are no more eggs for that season. Some other breeds under good care, will commence laying in early spring, and continue to lay with commendable perseverance until the weather becomes quite cold. Breeds of poultry possessing these characteristics are very good to rely on. Good treatment will be promptly paid for. There are other breeds that will lay almost the entire year, with the exception of the time spent in resting or in sitting. These are the nearest approach to perpetual layers, and even the fowls of these breeds will at times stop laying for no other apparent reason than that they seem to want a rest—which is reason enough. Some breeds of fowls seem to be more apt to lay in winter, and others will lay only in spring. The natural tendency of all fowls is to produce eggs only in summer, and any improvement in this particular is due to natural selection, improvement in breeding and good care.

It is a comparatively easy matter to obtain eggs in winter, if the proper arrangements are made beforehand. Chicks of the large breeds that it is desired should become winter layers, should be hatched in March or April. This is very essential, as it is necessary that they should obtain a good growth. Leghorn and Golden Polands and the smaller breeds will do well enough if hatched in May or early June. I do not fancy as winter fowls those that have large combs, wattles and feathered legs; they are much too apt to suffer from the cold. All fowls require warm houses, plenty of good food and constant care, if it is intended that they should lay eggs in winter. There must be a variety in the diet, with access to pure water and broken oyster shells.

With all the conditions perfectly favorable, the farmer may have to feed his fowls until he is quite discouraged before he sees any prospect of fresh eggs. But if the fowls are cared for in an intelligent manner, the eggs are sure to come, and eggs produced in winter command a fair price, being much more marketable than those that have been salted from the summer before. I do not mean that eggs produced as they are on some farms, one or two per day to every dozen of the half-starved fowls, are profitable. But I do mean if sufficient hens are kept to produce in eggs two or three times the cost of their keeping, besides furnishing one of the greatest luxuries for the farmer's own table, that no farmer who has tried it will say that such fowls do not pay. Hens that have laid a good share of the winter will usually want to sit pretty early, and this is a great advantage. The hen-house should be ready for the hens it is desired to keep over, early, at least before the weather gets cold. The fowls should not be allowed to experience any ill-effects from cold or damp weather, as a sudden or severe chill exerts a very injurious effect upon any breed of poultry, especially upon hens intended for winter layers. The house should not only be made perfectly comfortable but should be kept perfectly clean. It is a good idea to whitewash the inside of the building before the birds go into winter-quarters. They should have all the stimulating and heat-producing food they can consume. All that hens are fit for in winter is to produce fresh eggs at a certain price per dozen, and they must be fed and cared for with that end in view. I find that hens will pay a much larger price for grain consumed in winter than in any other season, and therefore they can be made much more profitable then than at any other time. FORREST K. MORELAND.

Unhealthy Poultry.

The mode of raising stock birds for sale to farmers, insures weakly, sickly flocks. No bird confined between fences, to march back and forward over its own excrements, to lose all chance of insect food during summer, to have little use of its wings; to be, in fact, a prisoner, can be expected to be healthy. But fancy breeders who raise from two to 20 varieties, are forced to do this violence to common sense and their customers. Even when roosters are purchased to infuse new blood and new vigor into a flock of hens of good stamina, the effort is a failure; good blood can't be improved by the addition of bad blood. If farmers want the real value of their money imparted to their flocks of hens, let them deal only with a breeder who raises but one sort, and lets that have the run of the farm. Why are people so blind to the simple question of "Improvement of Stock?" Few men would go to a hospital or pest house in search of husbands for their daughters; even the young girls themselves know too much to be deceived into mating with run-down, debauched youths, but men who are actually looking out for good blood look in the most impossible places for it, and take it from there, too, and then complain that poultry don't pay. S. RUFUS MASON.

Dairy Husbandry.

THE OLEOMARGARINE FRAUD.

A meeting of the National Association for the Prevention of the Adulteration of Butter was held in this city on Tuesday the 13. inst. at the American Exchange rooms, when a resolution was adopted, the preamble of which denounces the increased fraudulent sale of oleomargarine in the guise of butter, thereby deceiving the consumer and defrauding the farmer and dairyman of the legitimate profits of their labor; condemning the course of certain firms interested in the profits of oleomargarine manufacture, and finally resolving

"That we, the merchants engaged in the butter trade representing the Society for the Prevention of the Adulteration of Butter, condemn all encouragement given to those violators of the law, as hostile to the dairy interests throughout the United States, and that we use every effort to increase the fund already raised to prosecute not only offenders in the city of New York but in adjacent cities; and to use our personal means to disseminate throughout the country all information respecting the suits now being prosecuted and the parties defending the same.

Resolved, That 5,000 copies of these resolutions be printed for distribution in the United States."

The resolutions made a decided sensation, and at the close of their reading Mr. H. K. Thurber arose and said that in his opinion and in the opinion of several other persons the resolutions were aimed at his house. If such was the case he begged to enter a denial and a protest, as his firm sold oleomargarine openly and under its proper brand. He was not to blame for what the retail dealers had done. He was a commission merchant, and sold what the people wanted to buy. He said that oleomargarine was a product of the farm, and it could not be ignored or put down. Its sale and use were too well established to be overthrown by edicts or denunciation. There was some applause at this, and then half a dozen of the legitimate butter men arose and denounced what they called the oleomargarine swindle. It was proposed to have additional laws passed to protect the pure butter interest. Mr. Neal said the present law was good enough; all it needed was rigid enforcement. The Secretary said if Mr. Thurber's name had not been connected with the oleomargarine trade and given it an air of respectability, it would have died a natural death. He did not object to any one using "the stuff" or selling "the stuff" under its own name, but he did propose to fight it when sold or palmed off on the people as butter. A long debate followed concerning the resolution. Some said it was too personal; some said it was too sweeping; others wanted it referred back to the committee for revision; several offered substitutes; but at last all propositions and amendments were voted down and the resolution was carried by a strong majority.

Miscellaneous.

WHAT OTHERS SAY.

THE COW PEA.—The old Maryland Farmer says: "We have been familiar from our boyhood with this pea, which Dr. Ledoux, of North Carolina, writes about and which the RURAL NEW-YORKER illustrates and devotes so much space to. . . The greatest value of the Cow or Southern Pea is its great use and adaptibility to green manuring. We recuperated many poor acres by the use of peas alone. The late J. Q. Hewlett, of Baltimore county, made rich several hundred acres of poor land chiefly by the use of Cow Peas. He gave, years ago, his experience with this vegetable in several well-written articles which attracted much notice. Every volume of the Maryland Farmer has had frequent reference to the value of this pea—has steadily impressed upon the farmers, year after year, the importance of growing this crop, because we have practically tested their value by repeated experiments to our entire satisfaction. Peas are a God-send to the poor farmer on poor land. They will grow where nothing except "poverty grass" will grow. . . So we may say now, for the hundredth time and more, plant Southern field peas, either in drills or hills, for forage, seed, or as a manurial crop. . . As a crop for market they pay better than wheat or other grain crops on the same land. . . On very poor land they will give more bushels of seed than any grain crop, and yield more forage or provender than any cultivated grass known. . . It is surprising that a plant so well known for so long a time should just now be so suddenly made so

conspicuous and heralded as if a grand discovery to help the progress of agriculture."

[We may say to our respected contemporary, the Maryland Farmer, that we have well-grounded hopes that it may prove as valuable in this climate as it is known to have proved in more southerly climates, and it is for this reason we have given so much space to its consideration. Acting upon our faith, which comes from our own tests, we have purchased a quantity of this Cow Pea, large enough to enable us to send a small packet to all of our subscribers who apply for our present "Free Seed and Plant Distribution."—Eds.]

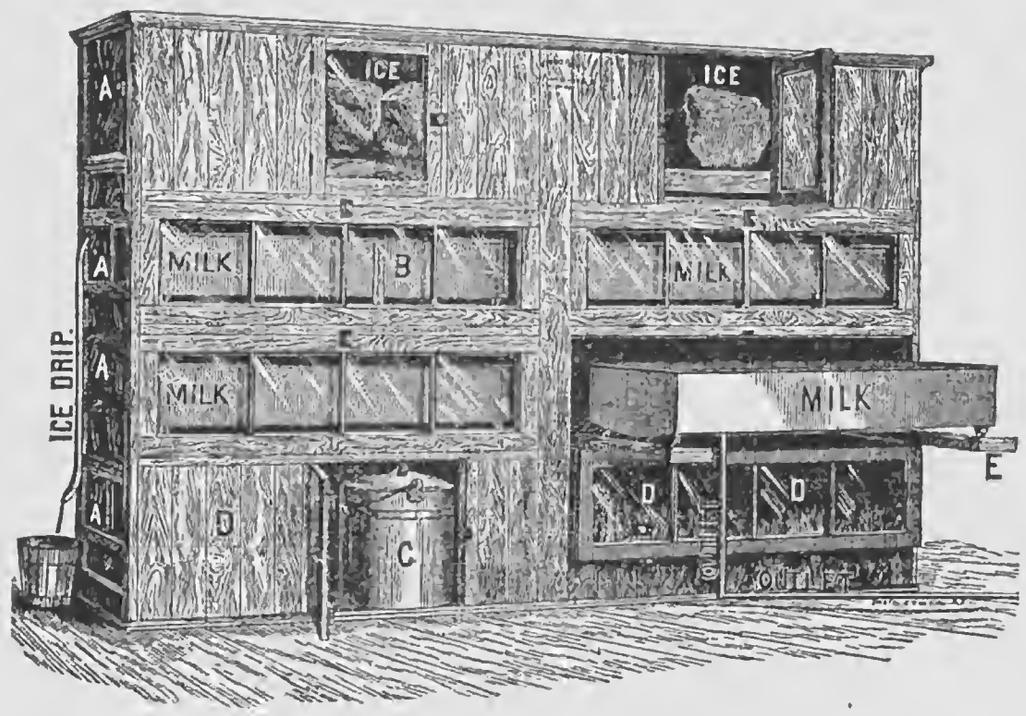
PEARS.—DUCHESSE D'ANGOULEME.—The general popularity of this pear, says the Country Gentleman, will be understood when it is borne in mind that it has received the highest vote for value in the catalogne of the American Pomological Society in twenty-two of the States of the Union, and the next vote for value in thirteen more States—thirty-five States in all. Its large size renders it extremely popular in market, although not of first quality in flavor. But a point of special value is the exemption of the tree from the blight, this disease rarely making serious inroads into orchards planted with this sort. Its general hardiness has been shown in neglected orchards where nearly all other sorts have disappeared for want of care, while the Duchesse has remained in full vigor. In portions of the Western States it has not succeeded. The Bartlett, however, stands first for general popularity, in spite of the drawback on account of the liability of the tree to blight. It bears while young. Doyenné Boussock is one of the few which succeed perfectly on quince stock. Clairgeau varies from worthless to good, according to season and location. The quality generally improves as the tree grows older. Flemish Beauty, when fine, is very fine. It does not crack at present as in previous years.

ARTIFICIAL WINES.—The Keeper of the Seals recently addressed a circular to the Procurator General, as we learn from the London Farmer, relative to the so-called artifical wines, and the brandies made from them. The circular is particularly aimed at the "dry grape" wines, the manufacture of which has attained considerable importance in the South of Europe, whence wines are still turned out as if the phylloxera had never existed, and all the vineyards destroyed by it had been re-established by magic. M. E. Martin now takes upon himself the defence of these artificial wines in the columns of our contemporary, The *Journal d'Agriculture Pratique*, and asks what difference there can possibly be between wines made of fresh or of dry grapes. He claims that the chemical analysis shows no difference whatever between them, for all that the manufacturers do in working in dry grapes is to replace the water they have lost by evaporation. M. Martin does not advocate wine making from dry grapes alone; a certain proportion of fresh grapes must be added, or the necessary fermentation will not readily ensue. But he contends that if fresh and dry grapes be used in about equal proportion, the resulting wine will be exactly similar to that made from fresh grapes alone, and he defies the cleverest taster in the trade, or the most fastiduous eater to detect the least difference between them.

A NOVEL THEORY AS TO THE ORIGIN OF DIAMONDS,—One of Dr. W. B. Fletcher's frogs escaped from his frogarium some time ago, and was found the other day behind a register at his office starved to death and shrunk to half its former dimensions. The doctor dissected it, and coming to its lungs found these organs clogged with thousands of black crystals which looked like coarse gunpowder. Under the microscope those crystals presented regular facets, with smooth surfaces, presenting the same angle of crytallization as the diamond. On burning they gave off carbonic acid gas, and they are pure crystals of carbon, as the diamond is. According to the Indianapolis Herald, the doctor ingeniously theorizes that in the ages gone by the huge reptiles of the antediluvian period, dying under circumstances similar to those under which the frog did, may have formed large crystals of carbon in their lungs which were afterward transformed into the hard and lustrous diamond.—Scientific American.

AN ENGLISHMAN ON PROTECTION.—The Sheffield Telegraph says that America, France and Belgium have never swerved in one single instance from their policy of protecting the employment of the people; and what is the result?—that the capital of labor has been steadily turning over, accumulating and multiplying, and enriching all classes of the community. In America, especially, the effect of protecting the employment of the people has been little short of marvelous. The best workmen of England have flocked to her; industries that ten years ago had no existence, have sprung into vigorous life; she has multiplied her make of Bessemer steel eighteen times in ten years; she has seven hundred iron works in full operation; she now supplies herself in almost every manufactured article she requires; and neither war nor rebellion, nor debt, nor soft money, nor hard money, has been able to cause more than a temporary derangement of her prosperity.

THE A. A. A.—We propose to model our American Agricultural Association, (says Mr. Hardin in the London Ag. Gazette) very much upon the design of the Royal Agricultural Society of England, and we take great pride in pointing to the success of that institution, even under the great disadvantages of depression in agricultural interests that it has labored under in late years. If it could live through such trying times, we, with the strength of large crops and rising markets all around us, should certainly flourish. The encouragement that the movement has met with by letters indorsing it from good men all over the country, is flattering to the last degree, and makes us firm in the faith, and December will see one of the grandest agricultural Societies that has ever been organized." What! Saul among the prophets!



FERGUSON BUREAU CREAMERY.—FIG. 30.

WHEN DOCTORS DISAGREE.—The editor of the Germantown Telegraph says: "When are we to get done with that miserable fruit, the Kieffer pear? It continues to occupy space in agricultural and horticultural journals all over the country. And what matters whether it is a hybrid or a natural, so long as it is worthless—totally worthless in our estimation—at least as a table fruit?" Conversely, the editor of the Gardeners' Monthly says: "All we can say is, that we have eaten fruit of the Kieffer pear, which was equal in luscious richness to any pear we ever ate!"

CONGRESS AND AGRICULTURE.—When Congress shall stop its foolish quibbling and fighting, says the Western Rural, and give some intelligent attention to the subject of agriculture, establishing a proper department for its advancement, and making a decent appropriation for its support, it will have done more for the solid prosperity of the nation than has ever yet been done at one stroke in the history of our government. Agriculture is the support of the Republic, and to neglect its interests at Washington is little short of a downright crime.

DAMAGE TO TREES—The Germantown Telegraph says that there is more damage done to trees in taking them up in the nursery by rough, ignorant workmen, who have to be employed in the rush of business, than from any other cause in the transplantation. This fact is to be particularly remembered.

ENGLAND'S CHASTISEMENT.—Eighteen hundred and seventy-eight was a right good year, compared with its successor. If the one chastised us with whips, the other has chastised us with scorpions.—Agricultural Gazette.

CATALOGUES, ETC., RECEIVED.

CATALOGUE.—Peter Henderson & Co., 35 Cortlandt St., N. Y. Of the 128 quarto pages of this catalogue, 28 are devoted to flower seeds; 28 to vegetable seeds, and the rest to new or rare plants, vegetable plants, roots, small fruits, bulbs, flowers, etc., constituting in its entirety what Mr. Henderson appropriately calls it—"A Catalogue of Everything for the Garden,"—though, indeed, in this title many seeds and "things" for the farm are not counted in. It is fully illustrated with woodcuts, and one very showy colored plate of flowers of some of our best and latest Geraniums, both single and double, which, handsome as they are, are in no wise exaggerated. The catalogue is one that may be perused for hours with pleasure and instruction. This will be sent, we believe, free to applicants.

CATALOGUE of A. D. Cowan & Co., The American Seed Warehouse," No. 114 Chambers St., New York City. A plain but full and carefully-arranged catalogue of 65 pages. Choice seeds for the farm and garden with a summary of useful hints pertaining to their cultivation. Mr. A. D. Cowan has had an experience of several years in some of the leading houses in Europe, and latterly, for nearly ten years with the well-known firm of B. K. Bliss & Sons. He should, therefore, be well qualified to superintend his business. This firm, we see, offers a costly silver-plated ice-pitcher and salver as a premium to the fall exhibition of the Queen's County Agricultural Society for the best three specimens each grown from their seeds. Free to applicants.

FARM MANUAL.—Garden, farm and flower seeds—also blooded stock. This is not a very elegant catalogue, but there is a good deal of enterprise about it. We notice the Telephone pea here offered—also Teosinte (of which the RURAL has frequently spoken as of probable value for warm climates as a fodder plant), Blount's White Prolific corn, Doura, etc., etc. The catalogue also gives lists of all sorts of poultry, eggs for hatching, shepherd and other dogs, cattle, sheep, hogs, etc. Sent free.

E. & J. C. WILLIAMS, Montclair, New Jersey, Descriptive Catalogue of small fruits, grapes, bulbs, hardy roses, etc.,—seed potatoes. The "Montclair" Raspberry, of which we have given a portrait in our columns, is now first offered for sale. Catalogue free. Our readers may feel assured of fair treatment from this establishment.

CATALOGUE of the Monmouth Nurseries, Little Silver, Monmouth Co., New Jersey. Everything in the way of small fruits. Catalogue free. Mr. J. T. Lovett, well-known to our readers as an earnest worker in his special line of horticulture, is the proprietor. We advise our friends to send for this catalogue which will give them much trustworthy information.

VICK'S FLORAL GUIDE, to which we shall refer hereafter, is as usual a model of neatness and good taste. It is full of fine engravings with a front colored plate of a group of Roses. It is truly a Floral Guide. Mr. Vick's address, though it hardly needs to be given, is Rochester, N. Y.

FRANCIS BRILL, Mattituck, Long Island, N. Y. Market Gardeners' Price List of Cabbage Seed, Illustrated. This old establishment has for many years made a specialty of growing cabbage seeds. ALSO price-list of Garden Seeds in general. Free.

J. B. ROOT & Co's Garden Manual and Catalogue of seeds, plants, etc., 803 Kishwaukee St., Rockford, Winnebago Co., Ill. In addition to the regular lists of seeds, etc. are several good articles upon Garden Plants, Asparagus for Market, &c. Free to all.

DEPARTMENT of Agriculture Report for 1878.

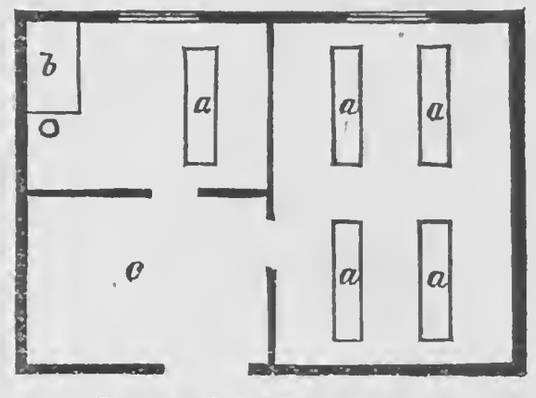
Industrial Implements.

THE FERGUSON BUREAU CREAMERY.

When examining the dairy apparatus exhibited at the recent dairy fair in New York our attention was attracted by a decidedly novel arrangement for setting milk. On close examination we discovered that this new arrangement comprised within itself every desirable point of excellence required for the most successful performance of this most exacting work of the dairy. That the setting of milk for cream is the one thing most needful for success in butter making, is amply proved by the great variety of appliances invented by practical dairymen for this purpose, and the considerable cost of some of the apparatus, in which much mechanical ingenuity is exhibited. The fact is, that a perfectly effective method of setting milk for cream is the great desideratum in dairying. It is the most important part of butter making as regards quantity and quality of product, and every one knows that profit bears an exact ratio in regard to the quantity and quality of the butter. Therefore a perfectly well arranged system of setting milk, in which convenience, cleanliness and effectiveness are all combined, is something that appeals directly to the favorable notice of butter makers.

The apparatus above referred to is the Ferguson Bureau Creamery made by the Ferguson Manufacturing Company of Burlington, Vt., and which is represented in the accompanying engraving. This is a handsome piece of furniture which may appropriately find a place in every dairy, and will not be out of place in any well appointed kitchen. Further, its arrangement is so perfect that where a well furnished dairy or kitchen cannot be afforded, it may be used in any place, even a cellar or a barn, and yet be found to offer great advantages and conveniences for setting milk under the most unfavorable circumstances. As may be seen, the creamery consists of an upright bureau or closet made of odorless, seasoned, spruce timber.

In the upper part is a rack which contains ice for cooling the milk when necessary, with a metal pan and escape pipes to lead off the water. Under the ice are spaces for four pans for milk. These pans are square in form with curved bottoms provided with means for drawing off the milk. Rests are provided upon which each pan may be drawn out (see engraving) upon its four small wheels, for skimming or emptying; each pan is intended to hold one milking and the pans vary in size for that purpose. Below the milk pans is a closet for cream and butter, of large capacity for storage. The construction of the bureau is such as to provide every facility for preserving an equal temperature; and for securing ample ventilation for removing all the odors or moisture which arise from the cooling of the milk. Further, the light is admitted to the cream by which the natural depth of color so desirable, is maintained. The temperature is lowered in summer by the use of ice in the upper closet or by a stream of cold water passing through pipes in this closet, which are provided for use in case this method may be practicable. Ventilation is secured by means of valves at A. A., which can be opened or closed at will, and through which air may circulate over and around the ice, passing over and around the milk pans and into the closets below. Gauze screens are also provided to replace the glass doors in front of the milk pans; and to prevent change of temperature during the filling or emptying of the pans, temporary shutters are provided to close the spaces which would otherwise remain open.



PLAN OF CREAMERY.—FIG. 21.

To warm the closet in the winter time a hot-water heater is furnished which is placed in the lower closet, warming the air which then rises through the closets above, and keeps the temperature even. The advantages *claimed* for the creamery are: uniform temperature within it; an increased production of butter on account of the perfect separation of the cream; a superior quality of butter by reason of the preservation of the cream from dust, odors, and other outside influences; perfect cleanliness and the removal of all undesirable odors from within; the least labor in doing the work; its durability; its adaptation for use in any room, dairy building or part of a house, with other useful points which are noticeable on sight. It is as useful in the factory as in the private dairy, and a public creamery furnished with this apparatus, would be a model of neatness and convenience. A plan of furnishing a creamery is suggested as follows: The building is divided into three apartments, one is supplied with four of the largest bureaus (*a a*), each holding 320 quarts or more of milk, as may be required; another has one or two bureaus, a sink and churns; and the other (*c*) is used for the receiving room or office. The milk and ice may be moved about on light trucks. The simplicity of the arrangement is evident. Last but not least, the cost of the apparatus is remarkably moderate, so much so that the saving alone, in a year, will amply repay the amount expended.

Everywhere.

RURAL SPECIAL REPORTS.

FLORIDA, Starke, Bradford Co., Jan. 5.—I have neglected to thank the RURAL for the fine roots of Cuthbert Raspberry sent me; but am often reminded of my duty, as I pass the rapidly growing vines on my way to my vegetable garden. We are having no winter at all so far, we have had only three light frosts, none of them scarcely nipping even the most tender plants. The thermometer most of the time stands from 70 deg. to 80 deg. in the shade. It is unusually warm even for this climate at this season of the year. Vegetable gardens look as they do at the North in July. On Christmas we had green peas, Irish potatoes, turnips, lettuce and radishes. The potatoes were fine and had been planted only nine weeks. I picked a few ripe strawberries, but the weather is too dry for them to ripen fast. If showers were as frequent as they are sometimes, we would have plenty of berries. The orange crop is much larger this year than last, and for a month past the fruit has been rapidly sent to market, where it has brought fair prices. The cotton ginning establishments have about finished their labors for this year. There are about twenty in this county, two in our village, one of which has turned out 100,000 pounds of lint. The crop was about half destroyed by the continued rains of August and September, but owing to there having been a larger acreage planted than usual, the number of bales is not much less than last year. Most of it is sent to the Savannah market, and has brought from 28 to 36 cents. To 100 pounds of lint there are about 325 pounds of seed. All but about one-fifth of the seed in this vicinity is sent abroad, whereas every pound of it should be kept and returned to the land. It has been bought by a firm in Savannah, and they are sending a great deal of it to Egypt for seed. Planted there it produces an inferior quality of long-staple cotton. There is a recent improvement in ginning machines. The old ones take out nothing but the clean seed, but the new invention takes out all the little lumps, leaving nothing but the pure long fiber. There is more waste, but the staple brings a higher price in market. The highest price for cotton both last year and this has been obtained by Northern men who have recently come here.

In answer to a correspondent the RURAL says that Bermuda grass in the South disappears in winter; that is not the case here; it remains green and fresh all winter. Even the hard freeze of a year ago did not seem to hurt it. It makes a handsome lawn, but will not grow tall enough to mow on any soil I have seen. We have what is called Crab grass, which comes upon the plowed ground in June and runs over everything. Cattle are very fond of it, and where the ground has been well manured, it will make a light crop of hay, *very light, too, here*. By October it all disappears, but it grows again. I. S.

ILLINOIS. West Jersey, Starke Co., Jan. 8.—Rain, rain every day this month hitherto. Weather warm and frost all out of the ground. Winter set in with but little rain or snow and water has been very scarce until lately, so that farmers were greatly troubled by want of it both for their families and stock. Crops for '79 were about as follows:—Wheat, oats and hay, light; corn was a very good yield in bulk, but it will not weigh as heavy as in former years. H. E. MC.

KANSAS, Larned, Pawnee Co., Jan. 3.—The "Notes from the Rural Experimental Grounds" in the RURAL of Dec. 27; on "Doura," have a peculiar interest to the farmers of this portion of Kansas, because they throw a partial light on a new crop that we have been experimenting with here for the past two years, and about which very little is known beyond what has been learnt by our own experiments. I refer to what we call "Egyptian or Rice Corn," which must be the white Egyptian corn referred to in the "Notes." I inclose a small sample of the grain for identification and would be glad to learn through the columns of the RURAL of its value for either animal or human food, and how it compares in nutritive or beef-producing qualities with Indian corn, or if any such comparison has ever been made. Our elevation here is 2000 feet above tide-water; a little too high to successfully raise Indian corn, at least until our country becomes more thickly settled and the land more generally improved. The Egyptian corn, however, promises to be a good substitute. In 1878 it yielded as high as 75 bushels per acre, and in the unusually dry season of 1879, 40 bushels per acre were obtained. Those who have fed it to their stock think it equal to Indian corn for fattening, and if given the choice, cattle, hogs and horses will all eat it in preference to Indian corn. Our farmers are so pleased with its productiveness, the cheapness with which it can be raised, and its adaptability to our climate, that they are going heavily into its cultivation the coming season. Cattle and sheep men are especially interested in its culture, as they expect that this corn, in connection with the Buffalo grass—which now affords such good pasture the year round—will enable them not only to raise cattle and sheep cheaply, but also to furnish beef and mutton for the Eastern markets at a cost that will almost defy competition. This corn has been ground into meal and is in use now as an article of food in many families, the flour being preferred generally to Indian corn meal.

The plan of cultivating this crop here has so far been to drill it in with a wheat drill, the rows being about three feet apart, one bushel of seed to 20 acres of ground. It is then cultivated the same as Indian corn, but only in one direction. When ripe the heads are cut off with a sharp knife, thrown into a wagon and hauled off. They are then run through a thrashing machine—any good separator will thrash 2000 bushels in a day. Any light you can throw on a crop that is at present of so much interest to the farmers of southwestern Kansas will be appreciated, as we would like to know just what the value of the grain is for feeding, before going so heavily into its production. H. R. H.

[In addition to what has already been stated in these columns, we regret that we can give our correspondent little information. The variety sent is White Egyptian corn, one of the many varities of Sorghum vulgare. It has for ages been cultivated in Africa and India for its grain which there forms an important part of cereal food, though in nutritious qualities it is considered inferior to most other grains. As to this, however, we are not possessed of any definite information. Perhaps some of our readers can furnish more information with regard to it.—EDS.]

KANSAS, Iola, Allen Co., Jan. 9.—Christmas Day was the coldest day during our two years' residence in this State—thermometer 7 deg. below zero. New Year's Day was foggy and it has remained so ever since. The frost is all out of the ground which is quite muddy. The fog is so thick at times that one can see only a few rods away. There is a heavy immigration to Kansas, and Allen Co. is settling up fast. Crops did well here the past season and the vast number of hogs and cattle is astonishing. H. M. S.

MARYLAND, Easton, Talbot Co., Jan. 10.—We have had and are having delightful weather. The warm rains have pushed the wheat vigorously ahead, and the young crop is now looking as well as I ever saw it at this season. The past summer was a dry one, yet our county made an excellent crop of corn of the finest quality. Most of it has been shipped, bringing from 60c. to 65c. T. B. B.

MICHIGAN, Muskegon, Muskegon Co., Jan. 10.—In your widely circulated paper are notes from all parts of the United States as well as occasionally from Canada, from which a reader can obtain quite a history of the productions, their modes of culture and the times of ripening of the fruits, vegetables and cereals of the entire nation. Permit me, therefore, to offer, as a return for the many favors of the kind received through your journal, a short description of that part of the State of Michigan, which is the home of my adoption and in which I have resided for the past twenty years.

The city of Muskegon, situated on the south side of the river and lake of that name, and about four miles above their debouchure into Lake Michigan, has increased in population from less than 1,500 in 1860, to over 8,500 in 1874, and is now estimated generally at 10,000. It owes its growth mainly to its peculiar situation and special adaptation to the manufacture and shipment of pine lumber. I find that all new countries bordering upon navigable waters, get a reputation given by sailors who see only what borders upon the waters they navigate. The northwestern part of Pennsylvania got the reputation of extreme roughness from the reports of sailors and raftmen upon the Allegheny River, which was true as far as they could see. This has also been the case with the eastern shore of Lake Michigan, which, for its southern half at least, is mostly made up of sand bluffs so fine and light of texture, as to be constantly rising up and blowing over the almost perpendicular banks ranging from twenty to sixty feet in hight. The prevailing winds being from the west, make their marks upon both shores of the lake, the western being flat, as far as I have seen it. These precipitous banks have given a character for barrenness to Western Michigan, that the facts in the case do not warrant, and which, in the settlement of the Northwestern Territory, bluffed off prospectors and settlers who preferred the more level and verdant plains and prairies further west. But the immense forests of the central and northern parts of the lower peninsula lured lumbermen from the exhausted lumber regions of the East, and disappointed settlers from the windy and treeless portions of the West, the former finding here not only vast quantities of pine and other woods, but abundant streams on which to float this timber to shipping points, where it is mainly manufactured into lumber, and shipped mostly to Chicago, but more or less to all other places, even to New Orleans, and to England; while the would-be farmer or fruit-grower finds here a genial soil and an equable climate, the latter unequaled east of the Rocky Mountains. The many streams which, in this State empty into Lake Michigan, all form lakes or lagoons near their mouths, but debouch into the big lake through the bluffs by narrow channels, thus affording commodious and safe harbors.

The largest of these streams is Grand River emptying at Grand Haven. The next largest is the Muskegon. Around Muskegon Lake are 30 steam saw-mills fed by logs floated down the Muskegon River and its branches, computed in the aggregate of floating water at 300 miles. These logs, when put afloat, are driven down and delivered at the different mills by the Muskegon Booming Co., and their record for the year 1879 foots up 432,762,094 feet, or what will cut that amount of inch boards. Those not using in their business figures amounting to millions, can hardly realize the quantity of the lumber sawed here the past year. If all were cut into one-inch boards, they would cover a surface little short of ten thousand acres. When we take into account that it is estimated that 100 million feet of the cut of the past winter have not yet come down the Muskegon, and that the cut of the Muskegon is only about one-fourth of the cut of the State, we can hardly avoid the questions:—What becomes of it? and what shall we do when the timber is gone? This question of timber supply for the future is becoming a serious one, and in this great timber country, standing timber is the most valuable real estate we have. S. B. P.

NEBRASKA, Orleans, Harlan Co., Jan. 9.—Fruit trees are scarce here; but money is scarcer. Cattle are in prime condition without having been fed a wisp of hay. Ice is breaking up in the Republican River. R. H. C.

NORTH CAROLINA, Brookston, Warren Co., Jan. 3.—The past week has been remarkably warm for this time of year—65° above zero every day. Land is in fine condition for plowing. Wheat is making rapid growth. M. B. P.

PENNSYLVANIA, Lineville Sta., Crawford Co., Jan. 5.—We are having very wet and changeable weather. We have had over three feet of snow with scarcely any sleighing, but there is plenty of mud at present. Corn is worth 50c. @60c.; oats, 32c.; wheat, $1.00@1.25; buckwheat, 50c.; potatoes, 35c.@40c. R. H. S.

PA., Venango Co., Jan 9th.—So far, this winter has been remarkably open. The mercury has scarcely visited zero and has not gone below that frigid point. A great deal of rains and lots of mud—no snow to speak of. The crops of the past season have been rather above the average. Fruit was very good. This county produces a great many apples but not much more fruit. Our markets here are not governed by the same circumstances as in other places; but by the price of oil. As that is low, produce is down, but business is improving rapidly. C. E. J.

WASHINGTON TERRITORY, White River, King Co., Jan. 1.—This place is exactly in latitude 48° north. The principal crops of White River Valley are hay and potatoes. Gooseberries, Raspberries, Blackberries and Currants grow in abundance. Black Caps frequently grow a stock from the ground and bear fruit the same year. There are thousands of acres of Cranberries, which yield abundantly on the marshes, but no one knows how to cultivate this sort of fruit, so that there is a fine opening here for any one skilled in this line. Coal is found in abundance, and gold in small quantities. There are fish in our rivers, but we can't tempt them to take a fly-baited hook. W. C.

The Querist.

ANSWERS TO CORRESPONDENTS.

Cattle Queries.

G. E. N., Afton, N. Y., asks, 1, whether he can without injury cross the offsprings of a blooded bull with their own sire, and how long can he practice such in-and-in breeding, using the same sire, without deteriorating the stock. 2, which is the best breed for the dairy—the Holstein, Jersey, Devon or Ayrshire—considering their yield, the cost of their keep, and their value for beef when they are turned off for the butcher. 3. Of two patrons of a creamery, if one brings richer milk than the other, as shown by the lactometer, he wants to know whether he gets a larger proportion of the butter made.

ANS.—Such close in-and-in breeding, though practiced largely by Bakewell, the Collings, and some other famous breeders, is not advisable unless the breeder has in view the attainment of a certain uniformity of excellence, or where other sires equally good cannot be had; and even then much judgment is demanded to avoid evil results. How soon weakened constitution, greater liability to disease, and barrenness may result from the practice, depends on so many considerations that no definite period can be named; but it is not improbable that a tendency to these defects may be generated at a very early date, though some time may elapse before they become manifest. "Line breeding," or crossing cows with bulls of a collateral branch of the same family, is a much safer method, and, as a rule, one attended with better results. Even here, however, experience shows that an occasional cross with a choice bull of the same tribe, but not of the same family, is often beneficial, if not necessary. 2, "The Best Breed for the Dairy" is a question which has caused no little wrangling. Among those mentioned the Devon must be excluded, as that breed, though often fair milkers, are more distinguished for meat than milk. If butter is the object, 'tis hard to beat a good Jersey, both for quantity and quality, especially for the latter. But there are Jerseys and Jerseys. For milk, cheese and butter, both the Holsteins and Ayreshires have fine reputations, especially for milk and cheese; but the latter would thrive where the former would starve. The Holstein is a massive beast that demands a large amount of good feed to do justice to its reputation; the Ayrshire, smaller, hardier and a better forager, is able to pick up a good deal of its food where its bulky rival could, or would, find none, and manages to do well on meagre fare. Under the best conditions for each, the Jersey is generally held to be the best for butter, the Ayrshire for milk and cheese, and the Holstein for its fattening qualities when dried off, although many say that the Holstein cannot be beaten for milk and cheese when well-fed. It is generally conceded, however, that the Ayrshire gives the best yield for its feed, and in view of its fine yield of milk, cheese and butter, and its adaptability to many conditions of climate and pasture, it may well be entitled the general-purpose cow. 3. No. All the patrons of a creamery or cheese factory share in the aggregate product in proportion to the quantity and not the quality of their milk. It isn't exactly just, but where is the remedy?

Wells and Cesspools.

Cess, Boston, Mass., says "My house is on the side of a hill. My well, which is stoned over, is about 18 to 20 feet from my cesspool. Between the two the land falls off four feet, the well being the higher on the hill. My cesspool is stoned up loose and is about eight feet deep. The hill falls off below my house a considerable distance. My water-closet, sink and bath-tub discharge into the cesspool. The well is not straight up the hill from the cesspool, but sidewise at an angle of about 45 deg. I do not know the depth of the well. The soil, I believe, is blue gravel. 1, Will my well become foul under these circumstances? If so, how soon? The conditions have existed for nearly two years. 2, Should I abandon the cesspool, would it be safe to use the well, provided it is not already tainted? 3. What would be the nearest absolutely safe distance between a well and a cesspool in a soil that is largely blue gravel?"

ANS.—1, The circumstances are full of peril. The well will without doubt be considerably deeper than the cesspool; a draft to scale showing the comparative situations is here given. The water from the cesspool sinks into the soil and will take a course in every direction from the center laterally and downwards. The dark-shaded strip from the cesspool to the well shows the line of saturation, which might be carried considerably further downwards. If the well is 24 feet deep, fully eight feet at the lower part is subject to infiltration from the cesspool. Two years or less would be sufficient to saturate the soil for 20 feet. Any expert would pronounce the case a seriously dangerous one. Test the water by placing an open glassful in a warm place for a week or two and observe if it is clouded or gives off any scent. Foul water has a sweetish taste and gives a brownish deposit which is precipitated by nitric acid, the organic matter being oxidized by the acid. The sweetish taste of water fouled by organic matter of this kind is often deceptive and therefore renders it more dangerous.

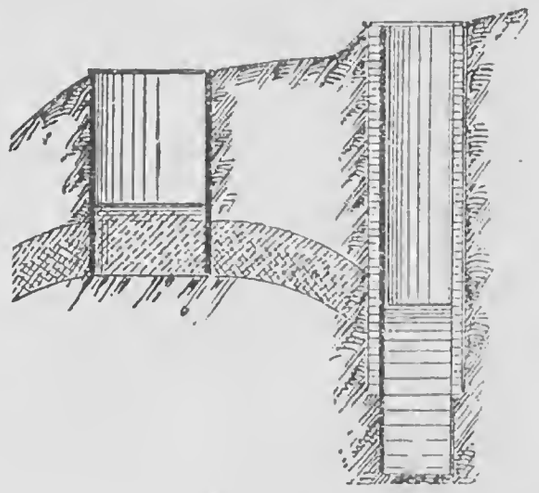


FIG. 22.

2. Yes. If the cesspool were cleared out and filled with fresh earth, the latter would absorb

a large portion of the foul matter and cause a reflux, so to speak, of the contaglon. 3. No well in gravel soil should be nearer than 100 feet to a cesspool. If a clay subsoil is near the bottom of the cesspool and *dips towards the well*, 200 feet might not be a safe distance. If the bed of clay dips *from* the direction of the well, 50 feet might be perfectly safe. To make the matter secure, it might be well to test the water. This may be done easily by pouring a few drops of nitric acid into a small narrow vial filled with the water. The bottle should be made perfectly clean and rinsed several times previously with some of the suspected water. If the water is colored yellow or brown by the acid, it is tainted with organic matter. Another test is to make a solution of permanganate of potash in pure water. If the color of the permanganate is weakened, the added water may be considered impure.

Preparing Peat for Fuel, Etc.

J. B., Union, N. Y., wishes to know the address of some one who has experience in growing basket Willows, where cuttings can be had, and at what price per 1,000; 2, if there is a ready market for willow shoots; the price per pound, and if they have to be peeled before they are sold. 3. He also wants to know how to prepare peat for fuel.

ANS.—At present we are unable to give the address of any one who has practical experience in the business. Cuttings can be had from most nurseries; we do not know their price. 2. The culture of basket Willows does not prove a success in America. Some say labor is too high to allow of any profit. Willow shoots of the proper size for basket-making are worth only five cents a pound prepared and delivered at the place of manufacture. One ton to a ton and a half to the acre is a large yield, and is seldom reached. Willow plantations suffer also much from destructive insects. There is not always a ready market for the growth. The best way is to contract with some manufacturing firm for the disposal of the crop. The shoots are generally peeled and prepared for use before they are sold. 3. In Europe, where in some countries peat is used almost exclusively for fuel, we have seen it prepared as follows:—A large quantity—several hundred loads—of peat is dug up and drawn together in a convenient place in a layer about three feet thick. When enough material has thus been collected, it is next worked up with water to one homogeneous mass to fit it for the form. This is done by driving a team and a wagon constructed for the purpose around in the mass till it has attained the proper plastic consistency, water being thrown on it all the time as needed. As soon as ready, the turfs, or peat bricks, are formed. A form with holes of the desired size is laid on the ground, filled with the peat, and then lifted up and drawn a little forward, again filled and so forth, till all the material has been used. When a large quantity of turfs are made, it requires much space to put them on. The peat is transported to the forms in wheelbarrows. After the lapse of a week or ten days, the turfs are turned on the edges to facilitate the drying, and, a little later, piled up in a conical stack for the same purpose. This is done mostly by children. The drying being done by the sun, the manufacture of this fuel must, of course, take place during the warm weather in summer.

Trouble with Churning and Butter.

N. J. C., White River, Washington Territory, says that her cows feed in the day-time on timothy and clover pasture or meadows where, owing to the great mildness of the season, they find lots of green, short grass; at night they are tied in the barn and fed timothy and clover hay with some Horn carrots—say a bucketful to each cow every night and morning. The butter from their milk is white, soft and tasteless. She usually makes fine yellow butter, but as soon as carrots are fed, this poor stuff alone comes. A neighbor's cows are fed in precisely the same way, yet the butter from their milk is nice and yellow; and she inquires what causes her butter to be white and tasteless or sometimes bitter, while her neighbor's is good and yellow. During her last churning after working one hour, the cream foamed and filled the churn so full that she had to take out a pailful; then after another hour's churning that cream foamed up to overflowing again so that another pailful had to be taken out, and it took from four to five hours to finish the churning, and she asks the cause of the trouble, which has occurred only while carrots are fed to the cows.

ANS.—Perhaps the quantity of carrots is too large for the cows' health. Try half the quantity and note the result. Late-cut hay makes white butter. The hay used may have been too ripe before it was cut. The bitterness in the cream comes from not skimming soon enough, and the difficult and frothy churning from having the cream too sour and too cold. Have a kettle of boiling water over the stove and when the milk is brought in and strained, set each pan over the kettle and scald the milk till the top wrinkles pretty briskly, and then set it where it will keep at about 60 degrees, and skim at the first appearance of souring—not later than 36 to 48 hours. Churn in about 12 hours after skimming and have the cream at 50 to 62 degrees, and you will have more and better butter and easier churning.

Windmills at Sea.

S. E. H., Milton, Ky., asks what would be the result of using a windmill on a ship for a mast and sail combined, using the power of the mill instead of steam power for propelling the vessel.

ANS. With any windmill made, the effect would be that in the first stiff gale that ship would lose every stitch of "sail" and probably her masts also. Those living on prairies have some idea of the force of the wind in a storm, but as it sweeps over the level expanse of ocean its power is still greater, while the stress upon the sails and the rigging is vastly increased by the tossing of the vessels amid the waves. Then again, it would be impracticable to set the "sail" so that the vessel could make any headway on her proper course in a contrary wind. In a moderate wind now a square-rigged sailing vessel can sail within six points of the wind, owing to the set of her sails, and a fore-and-aft-rigged vessel several points closer, eight points being at a right angle to the direction of the wind. By "tacking" therefore across her course she manages to gain some distances on it at every tack, but as a windmill faces the wind point-blank, there is no such thing as setting it aslant, and if it could be done, the impulse of the wind upon it could not aid in propelling the vessel, unless the wind was abaft the beam, owing to its level surface. As a sail, therefore, it would be worse than useless in contrary winds, while with a favorable breeze its necessarily small surface would give but little propelling power. As a generator of power to be used instead of steam, what windmill can produce from 3,000 to 4,000 horse power, the average power used in transoceanic steamers? There is a host of other considerations which would render such employment of windmills impracticable. These are exceedingly useful devices, but their only use on vessels is for pumping water out of the hold, and then in rough weather they have to be "furled".

Irish Potato Culture in S. C.

H. B., Greenville, S. C., asks: 1, when should Irish potatoes be planted in that section; 2, what varieties would be likely to thrive best; 3, should fertilizers be used, and, if so, what kind and how much; 4, how often should they be "worked."

ANS.—1, Plant as soon as the soil is in proper condition, which will probably be early in February in that latitude. Frosts may occur late enough to cut them down, which may retard the growth, and it would be well to leave a part for planting the last of the month, or early in March. The best crop of early potatoes a friend of ours ever raised, was planted in March, in latitude 42°, and was twice cut down by frost. 2, Early Rose for the main crop. It might be well to try some of the newer sorts, such as the Beauty of Hebron, in a small way. 3, Apply any good manure broadcast, plowed under. Unless thoroughly rotted and made fine, it should never be used in the hill. Ashes are excellent mixed with the soil in the drill or hill—the more the better; or, they may be mixed equal parts with plaster, and about a gill applied to each hill after the first hoeing. Cotton seed is also good—a quart or less to the hill. If commercial fertilizers are used, choose those rich in potash. 4. Twice is usually enough, if thoroughly performed; or work once and mulch with pine straw which, besides preventing the growth of weeds, keeps the soil cool and moist—an important consideration so far South as our friend's home. There are so many ways of cultivating this crop, all of them good enough, that we haven't space here to give them. A great deal of valuable information on potato culture, the result of actual experience in different parts of the country, was contained in our special Potato Number, published Oct. 18, 1879.

Preventing Rust on Wheat, etc.

R. L. S., Tangent, Oregon asks, 1, if there is any remedy for wheat rust; 2, what Prune is the earliest and best for his locality and where can he buy grafts. There are no curculios in Oregon, he says, and plums grow there to perfection.

ANS.—There is no remedy that in all cases and under all circumstances will prevent wheat from rusting. A distinguished German agriculturist states, however, that about six hours before sowing his wheat he prepares a steep of three measures of powdered quick-lime and ten measures of cattle urine. Two quarts of this are poured on a peck of wheat and stirred with a spade until every kernel is covered and white with the preparation. He has found it an effective preventive for rust, and he has followed the practice for many years. 2. The Peach Plum and Drap d' Or are the earliest of which we have reliable reports from Oregon; but many excellent varieties will do well there, among which, besides the above, are Washington, Yellow Egg, Jefferson, Reine Claude de Bavay, Prune d' Agen, German Prune, Coe's Golden Drop, Bradshaw, Columbia and others. Procure grafts from Eastern nurserymen if none can be had in your neighborhood.

Sore Eyes in Hogs.

W. S. T., Cornwall, Ont., Canada, has four Berkshire pigs which have swelled eyes; the swelling seems to be under the eyelids, and these are red and inflamed. He has been bedding them with oat hulls, and wants to know if the dust in the bedding is the cause of the disease, or what else can occasion it, and a remedy. 2, If oat hulls are fed to cows, will they dry up the milk?

ANS. 1, The dust from the chaff or hulls of oats would inflame the eyelids of pigs and so would the hulls, as it would be almost impossible for pigs to nest in a bed of chaff without getting the chaff into their eyes more or less. The dust would of itself be cause enough. The eyes of pigs sometimes become inflamed by colds in the head when they are exposed to a cold draught. They are often afflicted with catarrh caused by colds, which affects the eyes. 2, Oat hulls will not increase the flow of milk beyond hay, but will make it less. They are better than straw. Whether they will dry up the milk depends upon what the cow has been fed previously.

Destroying Stumps.

P. R. H., Avoca, N. Y., wishing to destroy some hard-wood stumps by slow combustion, by impregnating them with nitrate of potash, asks how much should be used; how it should be applied, and how long it would be likely to take to penetrate the stump.

ANS.—It is said that by boring holes into the head of a stump and putting into each hole an ounce of saltpeter, and after leaving it to penetrate the substance of the stump, setting the latter on fire, it will be completely consumed. This *may* be so. It is easy to try it when one has some stumps. We would suggest that a trial be made now; boring a hole diagonally downwards from each of four sides of the stump to a depth of 12 inches, inserting one ounce of saltpeter into each hole, leaving the stump until the spring. When it has dried considerably, put fire to it. Then please report the result. If you are successful, it will be the first case that has come to our knowledge. But we think it worth a trial, if for no other purpose than to settle this question.

Is Hungarian Hay Injurious to Horses?

R. H. C., Orleans, Nebraska, asks whether Hungarian hay is injurious to horses. He has fed it more or less for three years past. He has frequently been told that it would kill his horses, and last New Year's Day his best horse died. He is not sure the hay hastened his death. In the spring of '79, being anxious to get an old team into good condition for work, he fed heavily both of hay and corn. He found his horses growing stiff, and substituted bright oat straw for hay, and their limbs gradually regained their wonted suppleness. He is not sure but substituting chaff, or, better, oats, for corn would have been followed by the same happy result. If Hungarian hay is a dangerous feed, wherein lies the danger?

[Our correspondent, Mr. W. I. Chamberlain, who has had much experience with Hungarian grass and any of our other friends who have had experience in this connection, will, perhaps, kindly answer.—EDS.]

Scaly Legs in Fowls.

M. B., Fredericktown, Ohio, asks the cause of, and a remedy for, scaly legs in chickens.

ANS. The scurfy or scaly matter on the legs of fowls was carefully examined microscopically by Dr. Moxen and Mr. Tegetmeier who ascertained that it is due to the presence of a minute acarus, or mite, allied to the itch insect on the human subject. The remedy they prescribe is to soak the legs in warm water, so as to remove the scurf without injury, and to apply sulphur ointment. But we have cured it by the free use of kerosene upon the legs. The affected birds should be separated from the others, as the disease is contagious.

Sour Soil.

S. R. M., Dodge Co., Neb., is in blissful ignorance, yet has the folly to seek to be wise, thusly:—"Will some one, please, tell me what a "sour soil" is; where it is found; what causes it; how it is known from other soils; in fact give me such a description that I can be sure of it when I meet it? I am totally ignorant on the subject, and don't believe we have such a condition in Nebraska. I have never found any one here who could tell me."

Miscellaneous.

J. H. S., Lowell, Mass., asks which are the standard works on the following subjects, and where can they be procured:—1, on the culture of all the small fruits—Strawberries, Raspberries, Blackberries and Currants; 2, on the culture of the Grape, and on wine-making; 3, on sheep husbandry; 4, on poultry-raising on a large scale; 5, on bee-keeping.

ANS.—1, Barry's Fruit Garden, price $2.50; Fuller's Small Fruit Culturist, $1.50. 2, Harazthy's Grape Culture and Wine-making, $5.00; Husman's Grapes and Wine, $1.00; Buchanan's Grape Culture and Wine-Making, 75c. 3, Stewart's Shepherds' Manual, $1.50. 4, Geyelin's Poultry Breeding, $1.25; Wright's Poultry-Keeper, $2.00; Stoddart's "An Egg Farm," 75c. 5, Cook's Manual of the Apiary, $1.50, and Quinby's New Bee-Keeping, $1.50. All the works can be obtained through the American News Co., Chambers St., N. Y.

P. S. W., Newmarket, Va., asks whether packing butter in a vessel and putting this inside another vessel with a layer of salt all round the butter package, is a good plan for keeping butter in summer, and if so, whether a large unglazed earthenware crock would do for the outside vessel; 2, how many ducks should be allowed to one drake; 3, instructions to children how to play chess.

ANS.—Yes; yes. 2. Three. 3. We cannot spare sufficient space to give instructions enough to be useful in teaching the art of chess-playing By far the easiest and best way is to get some one who knows the game to tell how to make the moves and to form plans, the latter being essential in anything like fair chess-playing. We may, however, in a short time spare time and space for an article on this subject in the Literary Department.

R. S., Dunsville, Va., asks if there is an instrument used to ascertain the strength of vinegar, after the method of testing the strength of whiskey; if so, where can it be had and its cost.

ANS.—There is such an instrument used to test the strength of vinegar. The specific gravity of acetic acid, as compared with pure water, is 1.062, water being one. But ordinary vinegar contains only from two to three per cent. of acetic acid, and its specific gravity will therefore be very little more than water. Instruments of that kind can be had of E. B. Benjamin, 10 Barclay St., N. Y. City. We do not know the cost.

J. L. K., Middlesex, N. Y., T. D. H., Rochester, N. Y., J. R. G., Leavenworth, Kan., R. H., Newark, Ohio, S. T. M., Ontario, Can., asks whether the American Book Exchange, of this city, is a responsible concern and if it is safe to send it money in advance.

ANS. — Having had a great many queries of this kind of late, we made several inquiries from reliable parties who have dealt with them, and are satisfied that they are reliable dealers and have therefore admitted their advertisement into our columns.

J. M. W., Fernhill, Ont., asks: 1, what is the proper name for Lilac; 2, what is the proper name for a flowering Almond which blooms early in summer and grows about two and a half feet high.

ANS.—1, The botanical name of Lilac is Syringa. Syringa vulgaris is the common Lilac from Europe, of which there are pale violet and white varieties. S. Persica is the Persian Lilac; it is more slender than the above, with lance-ovate leaves and looser cymes. 2, Amygdalus nana is the botanical name of the little shrub known as the Flowering Almond.

I. G. C., (no address) wants to know the best mode for starting seed from Pinus Sibirica.

ANS. The seed may be sown in the open ground in the spring, but probably the best way would be to sow it in a pot or box during the winter, keep it moist and in a moderately warm room till it sprouts; then, in the spring, thump out the pot in the open ground and shade the young plants.

W. C. N., Rice Co. Kan., asks, 1, what varieties of Magnolia will succeed in that locality; 2, will it do to dwarf the Pear on the Orange Quince.

ANS.—1, Magnolia tripetala, M. acuminata, M. glauca, M. macrophylla and, in fact, all the deciduous Magnolias ought to do well in Kansas. 2. The Quince is an excellent stock for dwarf Pears and the one generally used.

W. E. E., Lamartine, Ohio., wants to know the best way to get out osage orange seed, and at what time.

ANS.—The seed is obtained by rotting the fruit and washing away the pulp; it is then scalded and kept warm and moist until it is sown. The best way to preserve it is to lay it in alternate layers with sand slightly moist.

C. H. J., Ingleside, Md., asks where he could get an incubator.

ANS. They are sold and have been advertised in the RURAL, by A. M. Halsted, Rye, N. Y.

NOTE.—IN reply to the many questions we have received as to where seeds of the particular kind of Doura of which "Notes from the Rural Grounds" spoke so highly in a late issue, we have ascertained that for the present, R. H. Allen & Co., 189 and 191 Water St., N. Y., can supply them in small quantities. We speak of this because we really desire that our readers should try this (with us) very valuable fodder plant, and we know of no other house that can supply this particular variety. The variety described by other journals as Doura develops a single stem and is valuable chiefly for its grain.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, JAN. 24, 1880.

SHORTLY TO APPEAR.

Notes from Dr. John A. Warder, T. T. Lyon, Ellwanger & Barry, P. J. Berckmans and others respecting the true Paradise Apple as a dwarfing stock, with illustrations.

On The Kinver and an entirely new French Yellow Globe Mangel as sweet as a sugar beet and as productive as other mangels—illustrated.

Leguminous Plants—grasses and valuable fodder plants, by Professor W. J. Beal—illustrated.

Stock Notes by Professor E. W. Stewart, L. S. Hardin, Richard Goodman, M. C. Weld, Col. F. D. Curtis, A. B. Allen and others.

Important Addition to the Rural's Seed Distribution.

Special Articles from Professor S. W. Johnson, Professor F. H. Storer, Professor G. C. Caldwell, Dr. A. R. Ledoux.

A Series of short articles upon the cultivation of our choicest vegetables—illustrated.

Dairy Specialties by Henry Stewart, L. S. Hardin, Professor L B. Arnold.

Fruit Notes by Pres. T. T. Lyon, Gov. Furnas, Dr. T. H. Hoskins, Sec. Garfield and others.

Poultry Notes by Forrest K. Moreland, Henry Hales and others.

Life Engravings of the Chinese Yam (Dioscorea batatas) "Cinnamon" vine; the Tulip tree and fruit &c., &c., &c.

Small Fruit Notes will be presented later by the well-known writers whose contributions have made this journal of such value in this important department of Horticulture.

TO NEW SUBSCRIBERS.

We find that many of our new subscribers have not seen our Free Plant and Seed Distribution supplement and consequently know nothing as to its terms. We will therefore send this supplement free to all who apply until further notice.

As originally announced in our Fair No. of Sept. 6, the Plant and Seed Distribution will be completed before March 1st. This for the benefit of our new subscribers.

Professor Blount has said regarding his White Prolific corn, that it must not be highly manured or a maximum of leaves and stalks and a minimum of grain would result. The reports of our prize-takers show that it is next to impossible to manure this variety of corn too highly. An immense amount of leaves and stalks will be produced in any event—they are characteristics of the variety.

Among parasitic plants, those which are destitute of green foliage are supposed to strike their roots through the outer bark and to live upon the elaborated sap of the inner bark. Such are the Dodder, so injurious to flax, Beech-Drops, Rafflessia Arnoldi of Sumatra &c. But our Indian Pipe (Monotropa uniflora) bears not a trace of green foliage or stem and yet it is not known that it is a parasitic plant. Dr. Gray suggests that though it may be parasitic on the roots of other plants in early growth, yet it afterwards appears to live in the manner of the larger fungi, upon leaf-mold and decaying herbage. Its mode of life should be investigated.

Mr. Wm. Robinson of the London Garden, a weekly horticultural journal that has many friends here as well as in England, writes us: "I wish you would tell us more about the beautiful hardy plants of your country in the Rural. A great many of your plants are among our finest garden flowers here, and it would be pleasant to know all about them. Of course, I do not mean technically, but how they look and grow at home; what localities they inhabit, and under what conditions their beauty is highest. The way the world of trees is treated in your paper is admirable, and I only wish for something equally good about the herbaceous plants and other hardy flowers."

There are few of our agricultural exchanges that do not speak joyfully of considerable additions to their lists of subscribers as compared with last year or preceding years at corresponding dates. This is good evidence of an easier feeling among farmers generally. There are also a number of new papers that have appeared within a few months and we hope the buoyancy of the times will assist in commanding a due appreciation among the favored people to whom they must look for support—for the American farmer of to-day must be classed as among the most favored people of the earth. We believe in enterprise, and the greater the number of agricultural and rural journals in our country, the harder we shall all have to work to merit a profitable share of patronage.

We are in receipt of frequent complaints about culpable delay and great carelessness and irregularity in the mail service in frontier places. No part of the post-office routes of the country is better paid than that over thinly settled States and Territories, and none so mismanaged. We are glad therefore that the matter is now being overhauled by a Congressional investigating committee. Of the $2,000,000 increase made last year in "Star route" expenditures; that is, for mail matter carried on wagon, stage, or horse-back, all except $300,000 went to Texas and the Territories. With liberal pay, we should have efficient service there, or know the reason why we haven't. Mismanagement in the matter at present seems to extend all the way from the Second Auditor who has charge of the contracts at the Post-Office in Washington, to the local postmaster on the most distant frontier.

For two years past we have often called attention to the excellence of a variety of sweet corn well known as Mexican. We have tested in our grounds all sorts of sweet corn and, as regards sweetness and a richness that might well be described as "buttery", we believe this Mexican variety should be placed first. That there is no market demand for it is owing to the fact that the ears are rather small (averaging seven inches) and, being as white as other kinds until the kernels begin to harden, there is no distinctive character by which it may become known to purchasers and others, and larger kinds are preferred. The Mexican corn grows about five feet high, is very prolific, often bearing two and three ears to a stalk, and remains for an unusually long time in a fit condition for table use. Even after the kernels begin to color, they are still sweet, tender and well-flavored. When mature, they are of a slate-color and much shriveled. Seed is offered by all seedsmen and we hope that those of our readers who have not done so, will give it a trial.

On Monday, the 12th inst., just as the last issue of the Rural went to press, the strike of the men belonging to the Butchers' Union of Chicago virtually came to an end, after having done a world of mischief during the five or six weeks it had lasted. At its commencement we recorded the impression that it was chiefly due to the desire of the hog-packers to reduce the price of hogs, which were at that time selling at figures that would reimburse the farmers of the country for the losses some of them incurred on their swine during the preceding year. This end has been partially gained, and the action of the "bosses" all through the strike has confirmed our belief that the object they had in view in permitting it was to depress prices. To gain this end, a heavy money loss has been inflicted on Chicago from which a great deal of business has been diverted to other points owing to the trouble; a still heavier loss has been brought upon the the farmers of the entire country, for the depression in prices due to the strike has extended everywhere; the families of hundreds of the workingmen have been forced to the brink of starvation, and the men themselves morally and physically demoralized by the shiftlessness, intoxication, and other vices inevitably fostered by idleness and exasperation of mind.

AN ILL-NATURED GIBE.

In noticing the appearance of a new agricultural newspaper in this city, the editor of the Nova Scotia Journal of Agriculture takes occasion to remark that: "The besetting sin of American agricultural papers is that they rehash 'science' after it has been filtered successively through German, French and English publications, and give paltry details of experiments by ignorant persons to determine what had been determined years before by exact methods in the hands of competent experimenters."

Perhaps of all people in the world, it least becomes an agricultural editor of that particular province of the Dominion to criticise the American newspapers in language such as this. The statement above cited is neither considerate nor just and a full half of it is not true. No doubt there is much paltry experimentation in this country, such as would never be undertaken by persons thoroughly informed in science and in the history of the art of Agriculture. To correct this crudeness, time enough must be allowed for the influence of our agricultural schools to penetrate far and wide. It may justly be expected that the graduates of these schools will, by precept and example, in due time remove all causes for such reproach.

In respect to the other point of the criticism: it is plainly absurd for any one to say that "science" dribbles down to us from *English* sources. Most of the leading agricultural papers of this country, and particularly the Rural New-Yorker, are at pains to procure their scientific articles from the first authorities in the country; and it has often been noticed that perhaps the most striking peculiarity which American science presents is its independence of the mother tongue. There can be little doubt that by far the larger portion of the knowledge of scientific matters which is current in this country has come to us direct from the great center of scientific activity, Germany. There was a time, it is true, some years ago, when the American methods of teaching mathematics, physics, chemistry, and medicine came largely from France; but of late years we have turned more and more towards Germany; and it is a very long time since we have looked to England, except incidentally, for scientific teachings. In this connection it may well be asked what treatise on science in its relations to agriculture has England given us, in recent years, to compare with the books of Prof. S. W. Johnson, "How Crops Grow," and "How Crops Feed?" How is it that the standard German scientific work on cattle-feeding by Prof. Wolff is even now being edited in New Haven, to be published in this city while we may look in vain toward England for any approximation to a work of such character? It is worth while to remember that the books of Prof. Johnson were republished both in England and Germany.

Dr. Lawes has done admirable service in England as an experimenter, and in this country as a writer, also. But in this we see no filtration. It is a legitimate flow of knowledge which we are proud to accept and uphold. We can assure the Nova Scotia editor that he has fallen into error as to the sources and the composition of our scientific "hash."

THE POISONING OF WELLS.

It is probable that ninety-nine cases in a hundred of disease in rural districts are the result of poison absorbed into the system either from the stomach or the lungs. The blood is manufactured in the digestive organs from the food, passes in great part through the liver, and all of it through the lungs, in both of which it is filtered and purified, and in the latter it is brought directly into contact with the air which is breathed by inspiration and is subjected to any deleterious matter which may be contained in it. As the food and drink are the materials of which the blood is formed, any unhealthful or poisonous influence at this prime source, of course poisons the stream; and as the function of the lungs is to aerate and purify the blood, anything wrong in the purifying material, interferes with this important vital process.

But we propose here only to call attention to what we believe to be the most prolific source of rural diseases, malarial, functional and organic in their character. This is the water supply. A case in point appears in our column of inquiries and answers, and we have taken the trouble to illustrate it for the purpose of showing distinctly how wells are poisoned. In this case a cesspool eight feet deep, receives the excreta of a family, the wash from a bath-room, water-closet and sink included. Thirty or forty gallons a day, equal to nearly 15,000 gallons, or 2,000 cubic feet per year of the most poisonous kind of filth, are poured into this pool only eight feet deep, and, of course, soak into the soil and saturate it. Twenty feet only from this deadly sink is the well which is probably several feet deeper than the cesspool. The drainage from this cesspool will flow then in every direction in a circle of twenty feet radius only, before it pours into the well. For each foot in depth of this area there are about 1200 cubic feet. In a year the 2000 cubic feet of waste will completely fill this space of twenty feet around the well to a depth of more than a foot-and-a-half, and in two years to a depth of three-and-a-half feet. But two things cannot occupy the same space, and this filth will then be distributed over a much larger quantity of ground in proportion to the ratio of solid soil to the small interstices, or spaces among the gravel, in the mass. Taking this ratio as only ten to one, the 2000 cubic feet of waste will saturate 20,000 cubic feet of earth in one year.

It is true that the soil near the cesspool will retain the largest portion of the solid matter, and the first water which reaches the well will be filtered to some extent. But it is only a question of time—the lapse of which will depend upon the nature of the subsoil—how long or short a time will elapse before the poison pours undiluted into the well, and from it into the stomachs of the unfortunate and unsuspecting victims. If a bed of clay lies close to the bottom of cesspool, there will be no escape downwards and the period required to reach the well will be probably six months. If the soil is gravelly and the waste sinks downwards, there is the absolute certainty that a stream of water which flows into the well will be reached sooner or later.

A similar frightful certainty, slowly but surely approaching in thousands of cases, threatens in time to sap the life of unsuspecting people, who will by-and-by exhibit every symptom of insidious but fatal disorder. The hectic cheek, swollen glands, dry hot skin, disordered digestion, bilious derangements, headaches, tremors, diarrhea, dysentery, cutaneous eruptions, tumors, coated tongue, foul breath, and all the varied symptoms by which blood-poisoning first becomes apparent and the final deadly typhoid and malignant fevers are predicted, alarm the consciousness, while the source of the very poison itself is hourly used to allay the fever and thirst occasioned by it.

We do not desire to be sensational or to make too much of this. The danger exists and it is everywhere. The case before us, to which we call the closest attention, is by no means an unusual one. In fact, there are thousands that are greatly more dangerous than this, and every person who cares for his own health and that of the loved ones whom he shelters from harm with tenderest care, should see to it that this prevalent source of danger is eliminated from his household; and remember that *decomposing organic matter is the most deadly of all poisons.*

BREVITIES.

We are in hopes to be able to begin our Seed and Plant Distribution on or before February 10. It is very pleasant to make this *announcement* to our readers, but the distribution itself is a long, tedious, trying task.

Discontent in Germany seems to be assuming serious proportions. The people were promised a reduction in their taxes but the Government, in view of the prevailing distress, now assumes that this is out of the question.

Is it wrong to use butter coloring, provided the coloring matter is not injurious to the health? Why discuss such a question? It is right to please the eye whenever we can do so; and if we can relish our food the better for it, so much the better. Let us select larger gnats to strain over.

It is the rule in our office to answer every inquiry received either by mail (when so requested) or in our Querist columns. An unusual pressure of business during the past three weeks has obliged us to break our rule repeatedly, for which we ask the indulgence of our questioners.

All subscribers wishing our seeds and plants should send six cents' worth of postage stamps—that is, two for the seeds—four for the Raspberries. The rest of the postage and all other expenses we bear. All who have not seen it, should send for our seed supplement which explains the whole matter.

The following vegetable seeds may be sown in the open ground as soon in the spring as the ground can be worked and, should therefore first engage the farmer's attention as to selections: Lettuce, Onions, Peas, Radish, Parsnip, Cauliflower, Cabbage, Carrot, Celery, Kale, Parsley, Turnip, Spinach, Asparagus, Salsify. We remind our readers that nothing is gained, and oftimes everything is lost, by sowing seeds of the following vegetables too early: All sorts of Beans, Melons, Tomatoes, Pumpkins, Squashes, Cucumbers and Sweet Corn. There is not so much gained by starting tomatoes in the house or frame as is generally supposed. Try a plant or so each way.

That scientific investigation in agriculture is not only valuable, but that it is appreciated by the farmers, is demonstrated in Michigan. Clawson wheat, which formerly was but little grown in that State, was analyzed by Professor Kedzie, of the Agricultural College, and pronounced by him to be much better than it was generally supposed. After the analysis Clawson became the most popular variety of wheat. It advanced 10c. per bushel, making an aggregate increase of nearly $1,500,000 in the value of the wheat crop for one year, all of which went into the pockets of the farmers.

For Women.

DESCRIPTION OF CUTS.

ILLUSTRATION No. 23 represents an evening costume and a suit for every-day wear. We presume "RURAL" readers with appreciation and ingenuity, will be able to adapt the styles to their use. Any material suitable for the two modes may be used for their construction.

No. 26.

NOS. 24 AND 25—FRONT AND BACK OF PALETOT.—No. 24 showing the front of paletot, is of black fancy cloth, trimmed with skunk fur and bone buttons. No. 25, showing the back, is of diagonal cloth, ornamented with buttons.

No., 26 FASHIONABLE GLOVES.—The illustration gives a pretty style of glove for evening wear. They are of black kid, finished at the top with black lace over white.

No. 27, CRAVAT-BOW AND RUFFLE.—This pretty bow and ruffle is composed of Bretonne lace, made on a muslin foundation.

THE WOMENS' LETTERS.

I THINK the letters of the ladies in the RURAL of Dec, 27; very interesting. The question of "Marguerite" in reference to the chewing of tobacco and its use in any manner, has often occurred to my own mind I also would like to have the question solved. My oldest boy is seven years old and I dread his learning to smoke and chew just as much as I do any vice that men are addicted to. His father smokes, but I hope my boy never will; and right here I would ask the ladies if they have ever seen a man who was in the habit of using tobacco, have a handsome or cleanly-looking mouth? I never have; for it spoils both lips, teeth, and breath, this deadly noxious weed. Boys learn to smoke because they think it smart and manly, although their first efforts in that line may be attended with all the nausea of sea-sickness. The lady who allowed her little one to suck the "old man's pipe," under the impression that it would help him, must never have studied any of the laws of hygiene or health. She had more forbearance towards the "old man's whim," than I would have had. I'm afraid that "contemptible old pipe" would have graced the fire about the time I found my child imbibing its vile contents. With all due deference and respect towards "old folks," I must say that a good many of them are full of "notions" quite as useless as that of the "horse shoe" nailed over the door for 'good luck," the breaking of a mirrror portending coming death or misfortune, and hundreds of other such "moonshine ideas," that ill accord with the light of this 19th century.

No. 24.

What a splendid thrilling story "In Folly's Net" is. Poor Jean was severely punished for the folly of flirtation.

I am glad to see that there is a plea made by one of your correspondents for the "old maid" for they are a class that are generally pretty roughly handled, and I fully agree with the writer, that it is far better to live peaceably in single blessedness or wretchedness—whichever you may choose to call it—than to be the slave of a tyrant, or the poor down-trodden wife of a drunkard. How do you suppose a man would feel to come home and find his wife drunk, or perhaps "smashing up the furniture," for pastime, as some men do, why then it would be terrible? Yet there are thousands of wives to-day who (though far superior to their drunken husbands), have to stand and live through this misery day after day, becoming mothers with the dread that their children will follow in their father's footsteps, or hoping that perhaps his example may be a warning to them in later years. I believe in marriage for all, as it is ordained of God, but far better die unwed than to live for years in a literal "purgatory." The sentiments expressed by the writer on "Chemiloons" have my warmest approval, for I have a perfect abhorance of "corsets;" they are the bane of women's lives. I would not be hired to wear one; my daughter never shall, while she remains under my control. I had a music scholar once (a girl about 16 years old), who was always and is still complaining of constant headaches. She wears a corset tightly laced, and just think what a small amount of sense her mother must have, when she wanted her child to tie the strings to the bedpost and pull tighter. I reasoned with the girl and took down my Physiology to show her the shapes as nature and fashions made them, but she preferred the waist that looked as if the being were about to snap in two, but 'tis almost useless to say more on this subject. So long as it is the "fashion" for women to try and look as if they had no digestive organs whatever, just so long will the majority of women sacrifice themselves to this merciless "Moloch." I expect I have tried the reader's patience with this long, rambling letter, so adieu, wishing to all a "Happy New Year," peace and success during the year of our Lord, 1880. MRS. W. J. G.

Waterville, Kan.

MRS. HAYES'S attire at the New Year reception at the White House, will be matter of interest to female readers. Her dress was of white brocaded satin, wrought with gold threads. The V shaped front of the waist was filled in with lace and her sleeves were of duchess lace with embroidery of seed pearls. The court train of satin was long and square; rose buds were worked upon it with threads of gold. The plain white satin petticoat was trimmed with bias folds of satin divided by a fringe of gold and pearls. Broad bands of gold embroidery separated the petticoat from the court train. In her hair she wore a silver comb and on her neck a pendant—a cameo head of the President set in diamonds.

A LITTLE three-year old, whose mother was mixing a simple cough medicine for him, watched the process, and asked if it was good. He was permitted to taste, and exclaimed: "It's awful good, mamma! *Let's keep it all for papa!*"

Literary Miscellany.

CONQUERED.

CHAPTER II.

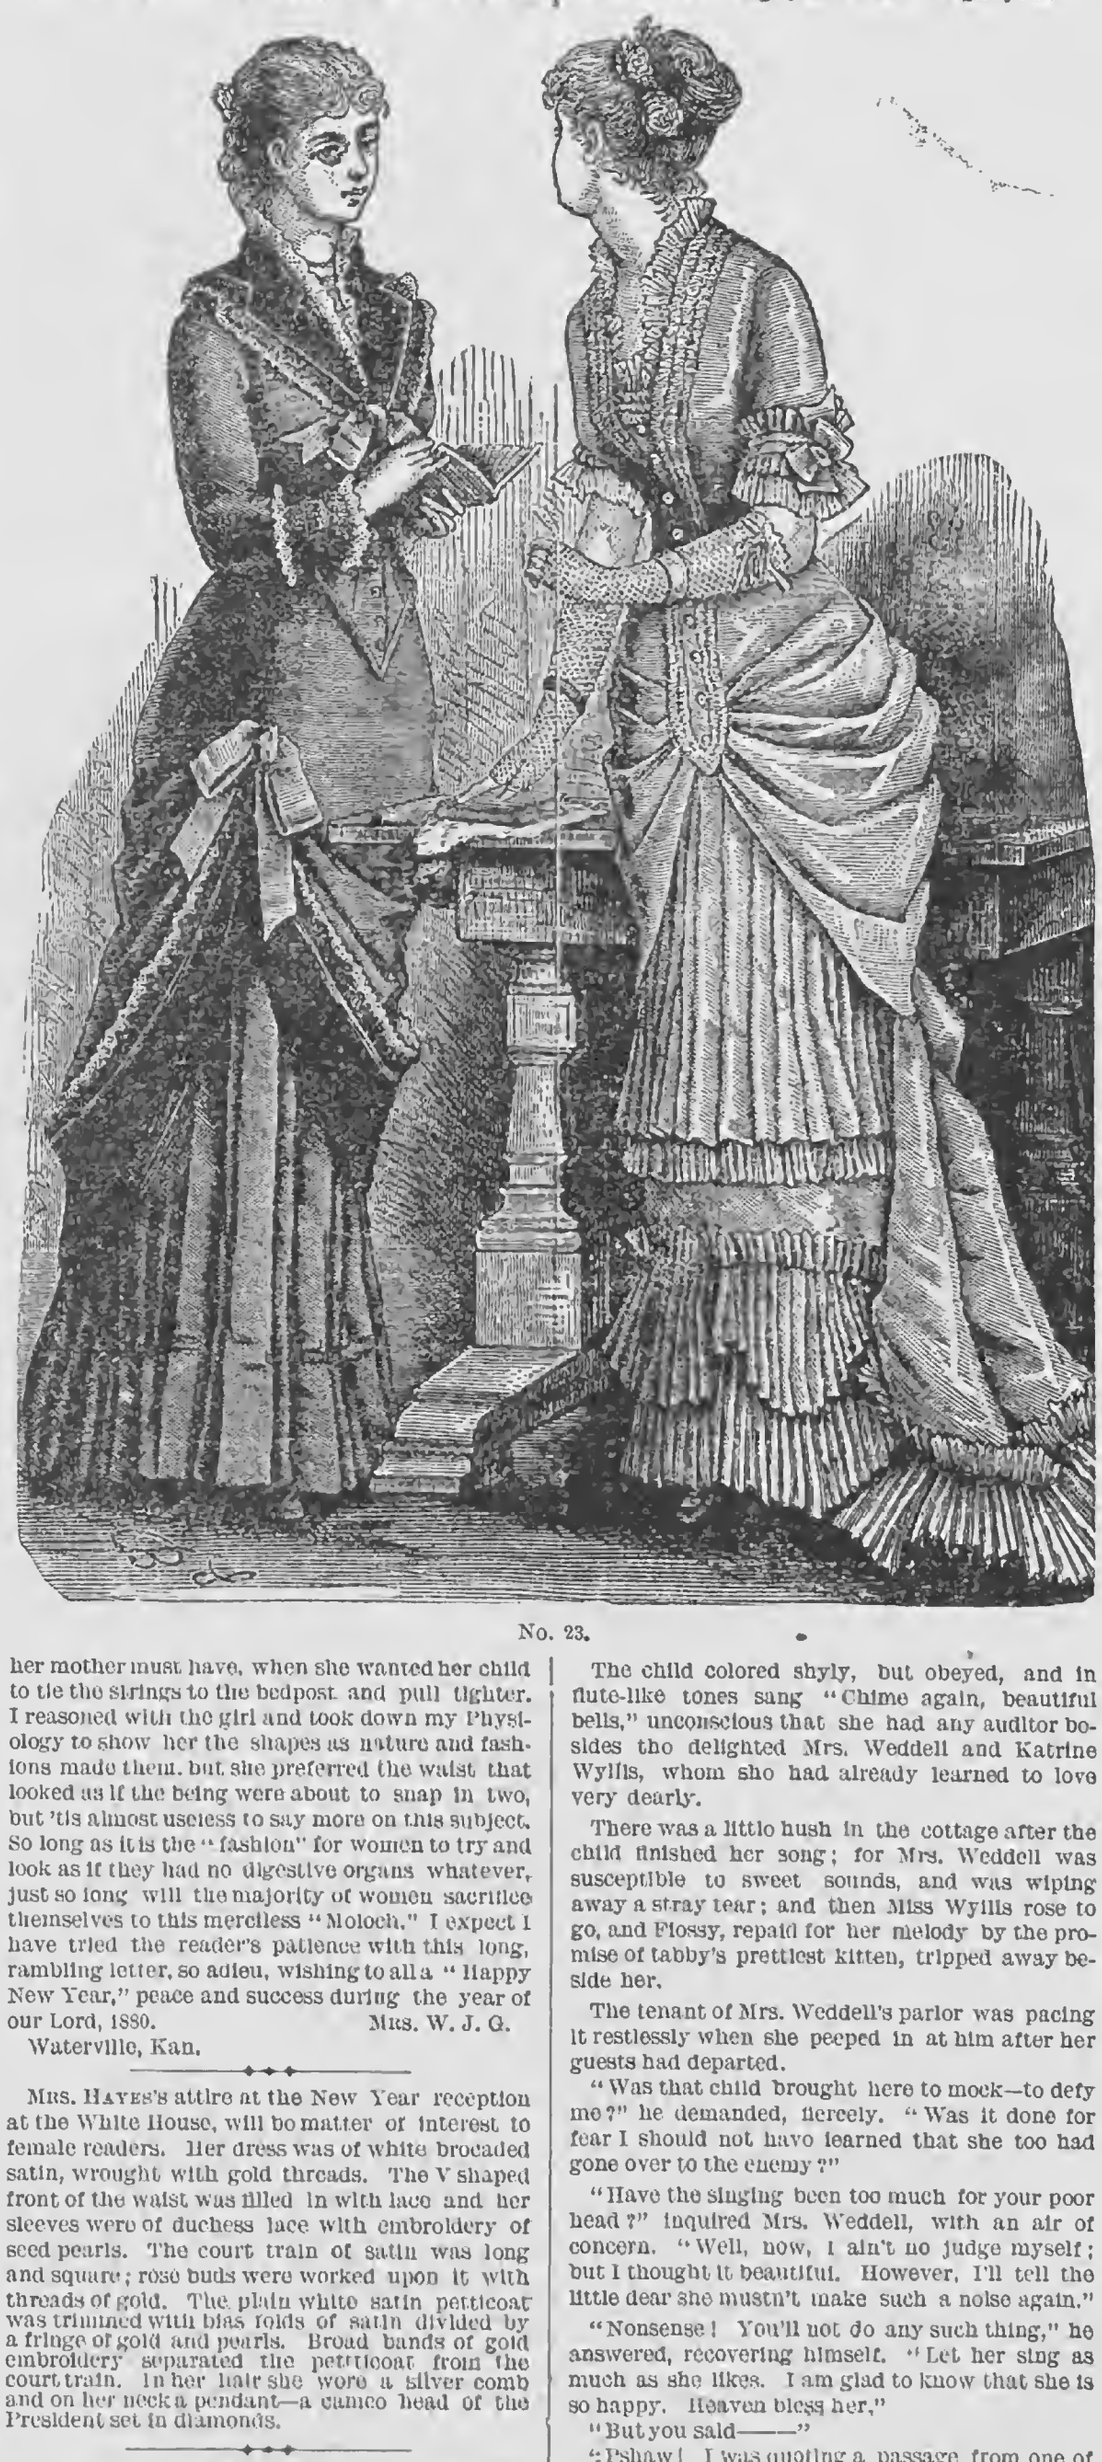
(Continued from page 845.)

"Poor man!" said the young lady, compassionately. "He need not be afraid that we shall intrude upon him if he so positively declines any sympathy. Time must effect his cure; but you will not, I hope, refuse this fruit and game our housekeeper has packed up for your use and his. Flossy!"

Her gentle call brought the child to her side directly. She was a pretty, fair-haired little girl about eight or nine years old, and there was something in her face so familiar to Mrs. Weddell, that she studied it intently.

"Your sister, ma'am?"

"No; a little cousin, who was to have spent her holidays at school, and, finding that she was not very happy in the prospect, we persuaded her governess to let her come into Sussex with us. Flossy, darling, I want Mrs. Weddell to hear how sweetly my birdie can warble. Will you sing to her one of the songs your brother taught you?"



No. 23.

The child colored shyly, but obeyed, and in flute-like tones sang "Chime again, beautiful bells," unconscious that she had any auditor besides the delighted Mrs. Weddell and Katrine Wyllis, whom she had already learned to love very dearly.

There was a little hush in the cottage after the child finished her song; for Mrs. Weddell was susceptible to sweet sounds, and was wiping away a stray tear; and then Miss Wyllis rose to go, and Flossy, repaid for her melody by the promise of tabby's prettiest kitten, tripped away beside her.

The tenant of Mrs. Weddell's parlor was pacing it restlessly when she peeped in at him after her guests had departed.

"Was that child brought here to mock—to defy me?" he demanded, fiercely. "Was it done for fear I should not have learned that she too had gone over to the enemy?"

"Have the singing been too much for your poor head?" inquired Mrs. Weddell, with an air of concern. "Well, now, I ain't no judge myself; but I thought it beautiful. However, I'll tell the little dear she mustn't make such a noise again."

"Nonsense! You'll not do any such thing," he answered, recovering himself. "Let her sing as much as she likes. I am glad to know that she is so happy. Heaven bless her."

"But you said——"

"Pshaw! I was quoting a passage from one of the poets, that was all."

"Was that poetry now?—a bit out of a battle-piece?"

"Yes, Mrs. Weddell; the cry of an overcharged soul worsted in the battle of life. Remember you are not to check that child's innocent happiness; and remember also that you are not to speak of me. Say that I am much the same, or that the pain is more intolerable than ever; it will be the truth—the sad, serious truth."

CHAPTER III.

BESIEGED.

Katrine Wyllis and little Flossy came to the cottage again in the course of a few days; but this time they had a bevy of merry companions, lively girls, whose laughter and chattering warned the solitary writer to turn his key before they were half-way up the garden.

No. 27.

"Don't look terrified at such an invasion! We are friends, not enemies," cried the tall, black-eyed, stately Brenda, as Mrs. Weddell, who had fallen asleep over her knitting, opened her eyes and stared at the bright vision of smiling girl-faces and well-dressed figures about her chair.

"Sit still—oh! do sit still!" implored Bessie Tresham, her sister, who had artistic tastes. "You'll make such a charming picture. I must sketch you just as you are. Wasn't it lucky I insisted on bringing my book and pencil?"

"I can knit, so give me your work," cried *petite, piquante* Madge Renton, possessing herself of the stocking. "Flossy, my darling, be our pretty page, and find seats for us. If Mrs. Weddell doesn't object, we mean to stay and talk to her. Not all at once, you know, because that would not be giving each other fair play."

With the aid of a stool and an old box, the whole party were accommodated, and Bessie commenced her sketch of their half-disconcerted, half-flattered hostess, who now found breath to utter a protest.

"You don't mean to say you're going to put me into a big pitcher like you have up at the house! Let me get my tother cap on first, and then I won't mind it a bit."

But the laughing girl seized and brought her back to her chair.

"No, indeed, we like you just as you are," the artist insisted. "Fold your hands on your lap, and look as placid as you did when we came in. Can't you go to sleep again if we are very silent for five minutes? Or if Flossy would sing and lull you off—where is she?"

Yes, Flossy, who sat on the rug at Katrine's feet cuddling tabby and the kittens, was quite willing, and as she warbled her simple, old fashioned songs, the carefully modulated voices of her companions took up the strain ever and anon, and made the harmony more complete.

Then Katrina, at Brenda's urgent entreaty, sang in the rich plaintive contralto that always thrilled her hearers, and never more than now, a quaint carol with a refrain that breathed of peace and good-will; and as she sang, the head of the listener in the parlor drooped on his folded arms, and the lips he had been angrily knawing, quivered with pain not unmingled with remorse.

No. 25.

"I can't see to do any more," said Bessie, presently. "But I may come again to-morrow, mayn't I, Mrs. Weddell?"

"And I?—and I?" queried the rest.

"Lor' love ye all!" cried their gratified hostess, "come as often as ye like. It do's a body good to see your merry looks! and I'll tap my elder wine to-morrow, see if I don't!"

"But I hope we shall not disturb your lodger," observed Katrine, gravely.

"Of course we shan't," said Madge, rolling up the ball of worsted and sticking it on the top of the knitting-pins. "He's deaf; fanatical, chronical; such people always are."

"Of course he is," assented Brenda. "We may come and go as often as we choose, but he'll never know it."

"I'm glad of that," cried Bessie. "It gives one such a comfortable feeling; but still it shall not make us unmindful of the poor dear old bachelor. His is a peculiar case, and we'll pity if we can't relieve him."

"Oh! yes, he shall have our pity," said everyone in chorus, and away they rustled, enjoining Mrs. Weddell to be ready for them on the morrow.

"It's impossible to read or write with such a lot of talking in the house," Mr. Dieppe told his landlady on the morrow. "If your visitors are coming again, I shall have to carry my book and papers upstairs."

"Lor' now, I thought them pretty young things' voices had such a pleasant sound!" she declared. "But shall I tell 'em you're *not* deaf?"

"By no means. Have I not forbidden you to mention my name to anyone?"

So the writing implements were transported to the bed-chamber, but as it did not boast of a fireplace, it was so intensely cold that the writer's hands were soon benumbed; and just after Katrine and her friend were to be descried coming towards the cottage, he crept down-stairs on tip-toe to warm himself in the parlor.

How musical those gay young voices sounded, and how infectious were those rippling peals of laughter! But he must not listen; it was mean, it was dishonorable: he would retreat again to his chamber.

However, it was not his fault that Mrs. Weddell's sash-door fitted so badly that he knew he could not pass it without being overheard; nor was it any fault of his that although he carefully retreated to the furthermost end of the tiny room, and endeavored to absorb himself in a translation from the German, stray sentences would reach him every now and then, and distract him from his book.

Bessie's sketch was progressing favorably, and he could hear her friends criticising and admiring it.

"When this is finished, I think I shall commence a fancy portrait of Mrs. Weddell's invalid," the artist observed.

"Poor dear old gentleman, don't make fun of him," cried Brenda, pathetically. "When people are *very* old, and ugly, and ill-tempered, one mustn't be too hard upon them. By-the-bye, I have brought him something to comfort his gouty feet," and she produced a pair of gaudy carpet slippers of majestic dimensions. "Present them to him, Mrs. Weddell, as from yourself. Mine is the sort of benevolence that prefers to shelter itself behind some one else. If the *pantoufles* shouldn't be large enough let me know."

"And I have thought of the patient sufferer as well as you," said Madge, holding up a hideously ugly wadded traveling cap, with lappets for the ears. "Make him tie these strings under his poor dear chin, Mrs. Weddell, to keep the draughts away. He might like to sleep in it."

"And here are a pair of scarlet muffetees for his wrists," added Bessie handing her a pair that would have fitted Daniel Lambert; "and, let me know, if you please, whether he suffers with cold feet. If so, I'll line one of my muff-boxes with flannel, and send it down for him to put them in."

"Inquire whether he wears glasses," said Brenda. "For we have a huge pair of goggles at home that belonged to my great-grandfather, which we will lend him with pleasure."

"And if he would like to be read to," chimed in Madge, "you can mention that I'm used to reading to a deaf person through an ear trumpet, and rather like it."

"And oh! Mrs. Weddell, if you should have any reason to think he has caught cold, if you only hear him *sneeze*," cried Bessie, "do send for me to make him some gruel. I've taken lessons at a cooking class, and never had any opportunity of putting my acquirements into practice. It would be such an opening for me if I were permitted to nurse up a chronical! I should so enjoy it!"

"What is a chronical?" asked Flossy, wonderingly.

"It's a mysterious ailment, my child," she was assured. "Only the invalid himself could properly explain the nature of it. Don't stop to ask any more questions, or we shall not be home before the dressing-bell rings."

Away they all trooped, laughing and chattering as before, promising Mrs. Weddell a water-color copy of her own apple face in the course of a day or two.

"Have you betrayed me to these giggling damsels?" demanded her lodger, stalking into the kitchen, and kicking across it the gouty slippers. "What do I mean? Why that, with the exception of Miss Wyllis, who seems endowed with more good sense and feeling than her companions, they are making a jest of me."

"Lor's now, I thought it was very good-natured of 'em! But differing people has differing opinions; and old Master Mascall would be glad of the cap and the shoes if you raly don't want 'em.',

"If I don't! Take them out of my sight! They represent gratuitous insults."

Yet, when he had stalked back to his own room, and was soothing his ruffled temper with a pipe, Mrs. Weddell was startled by hearing him burst into a peal of laughter.

On the morrow his tormentors invaded the cottage again, but it was only for a few minutes. The ice on the great pond was reported to be quite strong enough for skating. George Wyllis and a couple of his friends had gone into the village to get runners fixed in a chair for the convenience of Mrs. Tresham, the good-humored matron, who, with her daughters, had accompanied Katrine to the Hall; and the young ladies, with their skates, had agreed to meet them on the ice.

"Wish us a pleasant time, Mrs. Weddell," cried Bessie. "If your poor dear lodger would like a turn on the pond, wrap him up well in a few blankets, and we'll combine to push him about in our sledge."

"Better keep him beside the fire," advised Brenda, and let him amuse himself with these;" and she handed Mrs. Weddell a box of bronchial troches.

"Ah! that reminds me," cried Madge, diving into her pocket. "He might like to try the homœopathic treatment; so I've brought him my case. The globules got mixed up when I let Flossy play at keeping a doctor's shop; but I don t suppose it will signify which he swallows."

"Good-bye!" Flossy called back to the old woman. "We shall come and see you to-morrow, because it's Christmas Eve."

But long before the usual hour for their visit Mrs Weddell's lodger mounted his bicycle and rode away; nor did he return till darkness had settled down upon the earth. He must have ridden into the town; for amongst Flossy's Christmas gifts next morning she found a beautiful doll, which had arrived by carrier, addressed to Miss Florence Evelegh.

Mrs Weddell was busy making her plum-pudding when the young man went through the kitchen; but she suspended her work to listen to the exclamation of surprise he uttered on entering his room.

Fairy hands had been at work there, adorning it with holly and ivy. Beside his writing-desk there stood a vase of exotic ferns and Christmas roses, and on the mantel-piece Bessie at the last moment had placed one of her own clever sketches. It represented Faith, Hope, and Charity; but each of the angelic sisters wore the sweet, spiritual face of Katrine.

The young man gazed at it long, then walked away, and brushed his hand across his eyes; but he came back to press his lips reverently to the picture, and was carefully transferring it to his pocket-book when a rush of hurried feet passed the window, and the hasty opening of Mrs. Weddell's door was followed by a fall. He ran into the kitchen, to find the original of the sketch lying at the feet of the terrified old woman.

CHAPTER IV.

HOW THE SIEGE WAS RAISED.

"It was very foolish of me to faint," Katrine murmured, when the cares lavished on her had brought back her senses. "Pray let me go home at once, or they will miss me and be uneasy."

"But deary me, you are not fit to go alone, missie!" cried Mrs. Weddell; "how came you to be out at this time?"

The explanation was promptly given. A servant to whom a letter of importance had been entrusted had forgotten to post it and Katrine had discovered the omission while she was dressing for dinner.

"I knew some poor friends of ours would have but a sorry Christmas if they did not receive the cheque my brother had inclosed," she added; "and I knew he would be angry with the man for his carelessness, so I thought, I would run down to the post office myself; but there were a couple of men, I think they had been drinking," and she shuddered and grew pale again at the recollection, "and when they would have seized me I was so alarmed that I ran here.

"I must hasten home," she said again, with an apprehensive glance at the night.

"But not alone," said Mrs. Weddell's lodger, coming forward. "If Miss Wyllis will accept my escort, I shall be happy to walk with her to her own door."

With a bow and a blush Katrine assented, but ere they left the cottage he turned to speak to Mrs. Weddell.

"If a trap comes here before I return, give the driver my portmanteau, and tell him I will follow on foot."

"Going to leave me!" she gasped; "and so sudden like. Lor', Mr. Dippy!"

"I have been here too long," he responded sternly, and followed Katrine.

He soon discovered that she was trembling so much that in common courtesy he must beg her to accept his arm.

"Perhaps I ought to introduce myself," he added; "but as our acquaintance begins and ends to-night, it is scarcely worth while."

"Then you are leaving this part of the country?" said the young girl timidly. "We also propose returning to the home my brother has made for himself in Canada, as soon as the Christmas holidays are over. We are afraid that the hope that brought us to England will not be realised."

"I thought, that is, I fancied Mr. Wyllis intended to take up his abode at the Hall," was the remark this elicited.

"No, no; he has never dreamed of doing so," Katrine eagerly responded. "How could he? the house is not his."

"Not!" her companion repeated, with a start.

"Allow me to explain," she cried, almost breathless with emotion. "I will be as brief as I can."

And without giving him time to reply, she went on:

"Many years ago our great-aunt, Mrs. Wyllis, adopted the son of one of her nephews, and lavished upon him all her affection That she loved Bertram Evelegh dearly, I don't suppose even he would deny; but it is also certain that she brooked no rival in his affections and quarrelled with him violently when he insisted on providing for his orphan step-sister, a pretty child, for whom she conceived an unreasonable dislike."

"Unreasonable, indeed?" the young man murmured.

"In her fury Mrs. Wyllis drove Bertram from her presence, and destroyed the will she had made in his favor; but soon after this she was seized at Florence with an illness that proved fatal, and my brother and I, who were touring in Italy and staying near that city, were sent for. You are listening?"

"Most heedfully."

"You may have heard a cruel report that has been widely spread, to the effect that Mrs. Wyllis in her last moments was prevailed upon to execute a new will, bequeathing to my brother all that she possessed."

"I have heard and believed it," he admitted, "though I also know it was scarcely necessary to press the dying woman to do this, as Mr. George Wyllis was the heir-at-law already."

"Then now you must hear and believe me," exclaimed Katrine, impetuously. "Our aunt made no such will; nay, more in her last moments she bitterly regretted her treatment of her adopted son."

Katrine could feel the arm on which she leaned tremble even more than she did.

"Poor aunt died in my presence," she added, softly, "soothed by George's solemn promise to find Bertram Evelegh, and put him in possession of the property she always intended for him. Her last thoughts was of her boy—ah! you cannot think how grieved we were that our messengers could not find him!—her last words were an entreaty that I would some day tell him how truly she had loved him in spite of her injustice."

The hand of the fair speaker was raised to the lips of her companion, but he did not, nay, he could not speak; his heart was too full. Only a few hours ago he had been oppressed with the sense of his gnawing poverty, and the dependence upon him of the little sister for whose sake he had offended his capricious kinswoman; only a few hours ago—poor, friendless, and weighed down with a rankling consciousness of the unfair treatment to which he had been subjected—he had resolved to quit England forever; and now Katrine's melodious voice told him that all he had relinquished was his own once more.

But they had reached the grounds of the Hall, and Katrine was turning towards a side door. He must leave her, yet he could not do so without making one effort to put into words the conflicting emotions that swayed him.

"My sweet cousin, what must you have thought of me—"

Before he could get any further the door flew open, and a group appeared at it. Katrine had just been missed; every one was anxious about her, and her brother George sprang forward to clasp her in his arms, and exclaim, at the sight of her companion:

"Bertram Evelegh! Then it *was* your face Katrine beheld at the cottage the first time we came here. She recognized it as soon as she saw the photograph Flossy wears in a locket."

"Is this the fanatical invalid?" queried Brenda, saucily. "Oh! do introduce me! I am so anxious to know if he appreciated my gift."

"And mine; and mine," cried Madge and Bessie, sweeping him low curtsies. "Has his chronic ailment been benefited by them?"

"It's not Mr. Chronical; it's my own dear brother Bertram!" exclaimed Flossy, springing into his embrace. "I am so glad."

"Welcome to your own house," cried George Wyllis, shaking his hand heartily. "It's not customary for the guests to arrive before the host; but never mind. Here you are at last. The king has got his own again, hip, hurrah!"

"But are you in earnest? Do you really propose to act so generously by me as to give up all?" Bertram demanded, with quivering lips.

"My dear fellow," was the laughing reply, "there's no generosity in giving up what was never mine. Pooh! I have inherited an ample income from my father, so I need not grudge you yours. We have only been holding possession—Kittens and I—till we could find out where you had hid yourself. She declared you were at the cottage, and persisted in her opinion, even after we had tried the experiment of taking Flossy there to see whether her voice would bring you out of hiding."

"It did nearly; but I thought it would be cruel to rob the child of her new friends."

"And we had nearly lost him to-night, George," murmured Katrine. "He was going away."

"Going away? Why?" asked Mr. Wyllis, bluntly.

Bertram Evelegh reddened, and looked at Katrine, who, by some strange sympathy, colored yet more vividly and drooped her lustrous eyes.

"I will answer that question to my cousin Katrine some other time, if she will let me."

George Wyllis smiled, and then sighed. He began to understand the state of affairs, and to divine that Bertram Evelegh would not value his recovered fortune unless he received a yet more precious gift with it. But his own heart was captive to Brenda Tresham. He knew he should not return to his Canadian home alone, and so it was in his most cheerful tones he responded:

"We'll postpone all questions and answers till Christmas is over, and go back to the dining-room and drink a long life and a happy one to the owner of the Hall."

"And finish the evening with a dance," said Brenda.

"But ere we go," cried Bessie, "I should like to hear that the brave damsels who besieged the hermit knight are awarded the palm of victory."

"You confess that you were actuated by *malice prepense?*" queried the young man.

"Yes, and no!" cried Madge. "When Katrine's attempt to turn you out of your fortress and satisfy herself that you were Mr. Evelegh proved a failure, we insisted on being permitted to try what we could do. We hoped to exasperate you into a sortie!"

"What would you have done if you had proved successful?" asked the amused Bertram.

"Fled," said Brenda, theatrically, "and left Katrine to face the foe!"

"Pray do not call me that any longer!" he pleaded. "I am so ashamed of my churlishness that you may inflict on me any penance you can devise."

"Shall we take him at his word, and make him wear our cap and slippers?" asked Madge, with a grave air.

"Thank goodness, you cannot do that!" he laughed, "for they have already changed hands. For one gift I found on my mantel-piece to-night I can never be sufficiently grateful. I should have carried it with me wherever I wandered."

He looked at Bessie, who curtseyed and smiled very prettily at this allusion to her sketch.

"After all," said Brenda, "we cannot do better than leave Mr. Evelegh's punishment to Katrine. It was she who commenced the siege."

"Agreed," whispered Bertram, as he led the blushing Katrine towards the dining-room. "I wish for nothing better than to place my fate in such gentle hands. It will be the happiest moment of my life when I may be allowed to dedicate my future to the dear little cousin by whom I am proud to own myself 'FAIRLY CONQUERED.'"

"THE EYE-OPENER."

THE Post-master General transmitted to the House of Representatives last Monday a report in relation to the use of the mails by agents and originators of fraudulent schemes, including in the report an outline of the various methods employed to obtain money fraudulently through the mails. There are six different classes of swindling schemes referred to in the report, of which the lottery companies organized, or professing to have been organized, by State authority, are first considered. First comes the "Kentucky State Lottery," and parties connected with it operating in Louisville, Covington, Newport and Frankfort, Ky. Its owners are now said to be. Simons & Dickinson of this city and Murray, France & Co., of St. Louis, the latter being the managers of the lottery. The statement in its circulars "that the holders of prizes are secured by ample bonds deposited with the State by the lottery managers," is declared to be false, and the whole concern, claiming to operate on an old "grant" away back in 1839, is in effect pronounced rotten.

The Commonwealth Distribution Company claiming to act under the "Frankfort grant" is of the same stripe, having been declared illegal by Chancellor Menzies, of Ky, and no one being responsible for the prizes, except the tricky lottery managers. Other lottery companies mentioned are:—The Wyoming Lottery and Cheyenne Lottery Companies, the Grand Distribution Company of Victoria, Canada, and the New Brunswick Grand Gift Soiree of St. Stephens, N. B., "operated by one J. M. Potter, one of the most persistent, ingenious ubiquitous persons using the mails for the purpose of deceiving and defrauding the public by means of gift enterprises, schemes and devices." The Kentucky Cash Distribution Co., the Louisiana State Lottery and the Arizona Lottery have also been subject to investigation by the department. The drawings of the Canadian and the New Brunswick companies taking place outside of the United States, no action could be taken by the department in the matter of the return of registered letters and the non-payment of money-orders.

The next case mentioned is that of Edgar W. Jones, alias the Union Publishing Company, alias the Magnetic Watch Company of Ashland Mass., and having several other aliases under which he sent through the mails in 1876 80,000 circulars and advertisements of obscene books and a "Genuine Swiss Magnetic Timekeeper," which was in fact, a brass compass of no value. For months the complaints of parents, teachers etc., from all parts of the country in regard to the vile documents sent by Jones to their children were piling up on the hands of the Post-master General, until, through the exertions of Mr. Anthony Comstock, Jones was indicted and his business broken up. The next case is that of H. B. P. Allen, alias The National Banking Company, of 79 Nassau Street New York This so-called company, with flaming circulars offered to sell what they called "bonds" on the Havana, Kentucky and Louisiana lotteries at half the regular rates for tickets, and to add extra prizes to the drawings. They claim to be able to do this because they pay no percentages to agents and do business economically. They are characterized as bad frauds.

The Texas Gift Concert Association, of Denison, Texas, is spoken of as "one of the most successful swindles disclosed by the department records." Its receipts were about $100,000. The report of Special Agent Egerton on the case, dated "St. Louis, Sep. 18, 1878," which states that the managers of the concern divided the day's receipts among themselves every evening, and that tags representing unsold numbers were placed in the wheel at the drawing, and the prizes announced for them, thus enabling the managers to manipulate the cash at their pleasure. The agent stated that ten indictments were pending against the concern. "The Kansas Land Company," doing business at Topeka, Kan., belonged to the same class as the Denver Land Company. This concern advertised to give away "Kansas Homes" for $2 each, but as it was started about the time of the exposure of the Denver Land Company's swindle, it was frustrated almost at its inception by the prompt and energetic action of the Post Office officials. Various arrests and seizures are detailed in the case of Max Burger, alias Borger & Co, alias Wachsman & Co., bankers, No. 84 Nassau street, this city. The names were used to cover the sale of tickets in the Royal Havana, the Ducal Brunswick-Luneberg, the Free City of Hamburg, the Louisiana and the Kentucky lotteries and the Commonwealth Distribution Company.

Swindling land companies also receive attention. First comes that arrant fraud the Denver Land Company, exposed by us more than once. In addition to the "put and call" swindles exposed here last week under the head "A Specimen

Swindle," the following name is mentioned in the category:—Baxter & Co., who do not carry on business where their circulars say they do, but in a back room up two flights of stairs in New Street.

The various firms who advertise to forward upon receipt of 50 and 60 cents a bound volume of Webster's Unabridged Dictionary are also pronounced by the special agents of the Post Office Department to be impostors.

The Eureka Hog Cholera Co. has made a number of victims out West. In Warren County, Iowa, an organization has been formed to resist the payment of notes given by farmers. The Patent Iron Jack men get farmers to sign a contract as agents, but make the contract a note which is soon disposed of to innocent (?) parties. The Sliding-Gate humbugs, despite a judgment against them, are still trying to collect royalty. A heavy boot applied to the most honorable part of *their* persons, is the best argument with them. The "Ladies' Favorite Clothes Wringer" is pronounced worthless, except as a plaything for children. The Sprague Manufacturing Co., of Chicago, are accused of making it.

The latest swindle is styled "census taking." A gentlemanly fellow drives up with blanks for statistics on the farm—bushels of wheat, number of cattle raised, acres under cultivation, etc. Between the tables and the foot of the page, where the farmer signs his name attesting the statement, is a blank space, whose existence is accounted for as affording room for miscellaneous information. In a month more the farmer receives notice from a neighboring bank that his note for $150 is due. He knows nothing of the note, but investigation shows that the "census taker" has filled in the blank with a promise to pay, which, being now in the hands of an innocent holder, must be paid by the unlucky dupe.

BRIC-A-BRAC.

"What were the worst results of the civil war?" cried an orator. "Widows"—shouted Jones, who had married one.

A GOOD EYE CURE

"Can you cure my eyes?" said a man to Dr. Brown.

"Yes," said the doctor, "if you will follow my prescription

"Oh, certainly, doctor," said the patient; "I will do anything to have my eyes cured. What is your remedy, doctor?"

"You must steal a horse," said the doctor, very soberly.

"Steal a horse, doctor!" said the patient in amazement. "How will that cure my eyes?"

"You will be sent to State Prison for five years, where you could not get whiskey, and during your incarceration your eyes would get well," said the doctor.

The patient looked somewhat incredulous, but he did not adopt the doctor's remedy.

RECENT LITERATURE.

How to be Well. By M. Augusta Fairchild, M. D. S. R. Wells & Co., 737 Broadway, New York. Price $1.00.

A valuable work, written by a lady whose experiences amid her own and others' sufferings combined with good sense, render her more able to deal with disease both as regards diagnosis and care.

Advocating the use of water (both hot and cold) in various ways in cases of severe suffering she presents her theory so clearly and forcibly that one could almost wish he had never become familiar with the use of drugs, but confined himself to Nature's remedies, cold water, healing herbs and the observances of hygienic laws in the body's welfare and control. Read it! every earnest seeker after health. Every chapter will afford you food for thought, while the perfect style in which it is written, can but afford pleasure.

A Tight Squeeze; or The Adventures of a Gentleman as a Professional Tramp. By "Staat." Lee & Shepard, Boston, Mass. Price $1.00.

A well written book—original and intensly interesting, from its very outstart. Touches of rare pathos, and pictures of innocence are mingled with the strangest plot, one could hardly dream of. A pleasing feature of the book, is that one is constantly finding surprises. It is well worth knowhow a gentleman of $10,000 could renounce the honors connected therewith and become a vagabond, at least, in name, if not in nature.

Zigzag Journeys in Europe. Illustrated. Estes & Lauriat, Boston.

This volume is well adapted to the young people. It is both instructive, and entertaining; qualities which are calculated to win the youthful reader's attention. As the title indicates, it is a disconnected account of traveling experiences of a teacher and class.

MAGAZINES FOR JANUARY.

Good Company.—Number 5.—1880. Contents. A New Year's Song, Elaine Goodale; A Basement Story, Edward Eggleston; Acer Saccharinum, E. S. Gilbert; Roman Mosaics, II, Emily F. Wheeler; A Hard Bargain; a story, Horace E. Scudder; Reflected; a poem, Rose Terry Cooke; Certain Men of Mark: III.—Bismarck, George M. Towle; A Lawyer's Life, R. R. B; The Problems of French Protestantism, E. W. Hitchcock; Opposition; a poem, Sidney Lanier; The Mystery of Gillyflower Inn; a story, Lizzie W. Champney; Impressions of Washington; A Day Home for Working-Women's Children, Amanda B. Harris; Greek meets Greek; a story, Mary Densel; More Nooktown Gossip. Carl Clinton; Aspiration; a poem, Helen Ekin Starrett; Editor's Table.—Smith versus Smith; Gladstone Redivivus; You begun it; The latest phase of the School Question; Learning a Trade; Literature.

"Extract From Impressions in Washington."—There is a nameless fascination in the Washington air. The average citizen, living far removed from the capital, often wonders why the office-holder who once comes to Washington is so loth to leave it that he will often stoop to almost any device to secure a further lease of power,—whether it be four years in the White House, another term in either end of the Capitol or only a longer commission in a petty department clerkship. But when the citizen comes to Washington himself, the mystery is solved. He may not be able to define them very clearly, but he cannot stay long in the city without himself experiencing in some measure those subtle influences which render the capital so attractive to the permanent resident. Even to the casual visitor there is something very interesting about merely watching the great governmental machine or inspecting its component parts. The very atmosphere of the capital, instinct with the official and social life that centers about the seat of government in a great nation, seems to possess a singular charm, which disposes one to linger and enjoy it. The stranger no longer wonders that the office-holder likes Washington, that he constantly schemes for an extension of his term, that, if finally deposed from power, he so often prefers the most humble position here to a residence elsewhere.

Not the least among Washington's charms are its physical and climatic advantages. No one can longer doubt that the city is fit to be the capital of a great country. The comprehensive plan on which it was laid out in the early years of the struggling republic, gives one a fresh respect for those far-sighted fathers who could even then devise a scheme which should to-day fit the necessities of the seat of government for fifty millions of people, and be capable of equal development with the progress of the nation hereafter. The broad avenues are a constant source of delight, the parks and squares are ample for the needs of a large city, and the great system of improvements, carried through with whatever corruption under the Shepherd *regime*, laid the basis for the transformation of Washington from a straggling and neglected town to a handsome metropolis. Nothing goes farther to justify the choice of this locality as the capital than its climate. Though it suffers from the summer heats, its temperature during by far the larger part of the year is most comfortable, and the change from the inclement weather which prevails over the greater portion of the country through the winter months to the usually balmy air of the capital is especially grateful. Indeed, a winter residence at Washington possesses greater charms than in any other city on the continent, what with its mild weather, its exceptional social advantages and the attractions which the meeting of Congress presents to any one interested in studying our system of government at its fountain-head. Every year the capital is becoming more and more the winter-headquarters for people of leisure, for persons of literary tastes, for students of politics, for devotees of fashion, and a composite society is gradually growing up in which everybody is sure to find congenial elements.

The Saturday Magazine.—The issue of Jan. 3, 1880, has been received. Contents are: Miss Monkton's Marriage; A piece of Porcelain; Clawdevil; The Russian Gipsies.

A Piece of Poucelain.—Like a good deal else both in the works of nature and industry, the beautiful porcelain which adorns our tables and mantel-pieces had a harsh and unexpected beginning. It does not rise at the bidding of the skillful potter from clay found ready-made in the bosom of the earth, but is dependent on the nice, choice and careful adjustment of several elements, which are drawn from different places and demand very different treatment, before they come before us compacted into the beautiful clay that takes the shining shapes we so much admire. Porcelain is broadly distinguished from earthenware through being a semi-vitrified compound; one portion of it remaining infusible while the other fuses, and, combining with the infusible part, forms a smooth, compact, and semi-transparent substance. The beauty of porcelain results from the silica in the clay, which is infusible and preserves its whiteness under great heat; this gives to it the hard and resonant character, while its semi-transparency comes from the elements that fuse and envelop it. In China, where for ages porcelain of a very fine quality has been made, a peculiar clay was found in the earth, which greatly simplified the earlier processes for the Chinese potters; and in the development of the industry in Europe, research and invention have done their utmost to discover a directer process than has yet been attained. Hence probably the popular error by which the name was traced to the French *pour cent annees*, instead of to the Portuguese *porcellana*, a cup, based on the idea that the materials of which porcelain is composed required to be matured underground for a hundred years. The bulk of the materials do indeed require long maturing in the earth, but the origin of the name could hardly have sprung from that. Not the least interesting part of the manufacture, as we are fain to think, is the initial process of clay-making. Some time ago we had the privilege of a leisurely walk through one of the largest and most famous porcelain works in England, under the conduct of a guide well able to explain to us all the outs-and-ins of the manufacture, and we, in our turn, shall now make the endeavor to familiarize others in some measure with what proved of the greatest interest to ourselves.—*H. A. Page, in The Saturday Magazine.*

Demorest's Monthly Magazine for January, 1880—Contents:—Mozart, Steel Engraving; Illuminated Art Title to Volume Sixteen; Colored Steel Fashions; Good Luck Horseshoe; Cabinet Game No. 3; A Happy New Year, M. E. S.; The New Year, a Floral Design; Eighty, Margaret Sangster; The Trumpet Major, Thomas Hardy; A Dedication, Rose Geranium; The New Year, Mrs. C. S. Nourse; The Red Plaid, Auber Forrester; Talks with Girls, Imagination, Jennie June; Little Miss Spinner, or the Story of a Voice, Sarah Bridget Stebbings; Specimen Hunting at the Vineyard, Mrs. Annie E. Preston; Consolation, Scrapsey, a story of to-day, by H; New Year's Eve, by Cricket; Plans for a Dwelling House. House and Home—Household Art; Blades of Grass; A Paper of Pins; World of Science; Pressed Ferns; The Wedgewood Portland Vase; Chair Scarfs.

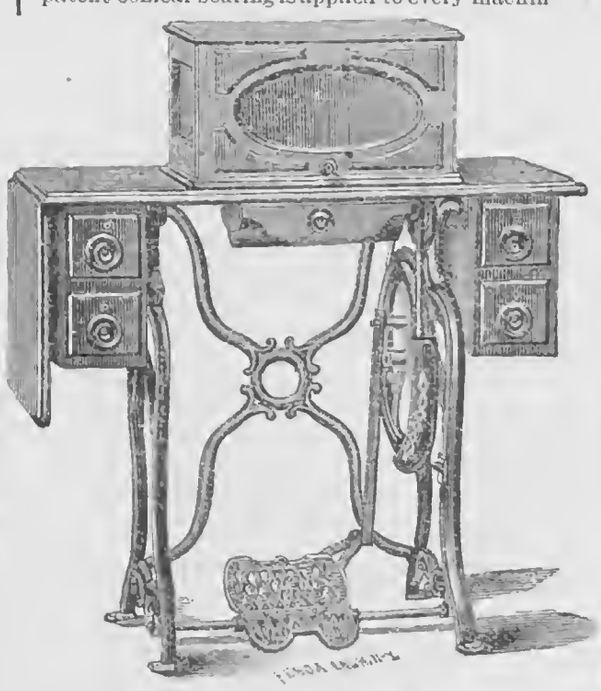
THE VICTOR SEWING MACHINE.

The machine illustrated in the accompanying cut (style 6½) is offered in our premium list for a club of 37 subscribers. The price of the machine is $37.50.

The "Victor" is a shuttle machine, having all of the latest improvements, including patent drop and interchangeable feed. It has the only straight self-adjusting needle to be found in any shuttle machine, by which the thickest material or the finest fabric can be sewed, using either cotton, silk, or linen thread, of any size or finish, making a perfect lock stitch alike on both sides. The running motion is light, easy, rapid, and noiseless, the bearing being positive, and the wearing parts being made of finely-tempered steel. The new patent conical bearing is applied to every machin



It is so fitted to either side of the drive-wheel and treadle that it entirely subdues and prevents jerky, whirring, disagreeble motion, and reduces the sound to an almost imperceptible hum. The "Victor" is adapted to every kind of sewing; has a self-adjusting shuttle tension, positive motion, certain take-up, a perfect and sure feed, crossing seams with certainty, and does not break thread or miss stitches. It has neither springs nor cog-wheels, is very economical in the use of thread, and does perfect work on all kinds of goods, from lace to leather. Made by Victor Sewing Machine Co., Middletown, Conn.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

A DINNER IN EVERY-DAY HOUSE.

MRS. ANNIE L. JACK.

Our bread is good this week, light, sweet and white but has one fault—the under crust is soft. The amateur cook tells me "that stove will not bake well at the bottom." I know it sometimes fails, and as it is sixteen years old—which is exactly the age of said "cook"—I think it has faithfully done its duty. "Never mind," I say "we'll have a new one when our ship comes home." The butter is fair. It was made in August, and might be richer in color and flavor. We are using the worst first, though, I have asked a good judge and he says "fair to good."

"A plain dinner to-day," I said this morning. A small roast of beef was put into the oven care having been taken to have it *hot* so that the meat would glaze over on the outside and retain its juices. We allow a quarter of an hour for each pound, and I have to give an extra quarter for our failing oven, especially if the wind is southeast, which has an effect on the draft. In order that the children may not eat too much meat, I make, with roast beef, a Yorkshire pudding which is put into the pan after the greater part of the gravy has been turned off and about 20 minutes before serving. It is very simply made, being a batter of flour and milk with an egg well beaten up in it. This is thinly poured over the pan, the meat, of course, being raised on a stand. The children are all fond of it served with the beef and vegetables. Of the latter we have Hubbard squash which is steamed, and takes but a teaspoonful of butter to make it palatable, and is very good without any. Our potatoes are Early Roses, than which for table use I require no better. Boiled 20 minutes in boiling water with a little salt, poured dry, and the pot well shaken for a minute, they are fit for—well! for even a Rural connoisseur.

A few small onions boiled in milk, are relished by the children and are a specific for colds during this changeable season. Indeed when eaten freely, boiled onions will break up an obstinate cough caused by cold. We have home-made pickles, of course, but do not find them a necessity. I noticed that the "cook" was studying her French exercises while the dinner was making headway, so I proceeded to make a simple pudding. There is plenty of apple-sauce made, so a deep pudding dish is filled three parts, then, taking about four or five table spoonsful of flour, I go to the jar of sour cream, and pour in enough to make a thick batter. This, when beaten well together, is poured over the apple-sauce. There is no soda, salaratus or baking powder, yet the paste will be light and, I think, healthful. We put butter on the table, but no one takes it, except one lad, and as he is to chop wood this afternoon, I have no fear but he will work it off. A rosy apple finishes our repast. It is one of our plain weekly dinners. I might have added some of the extra dishes in which we sometimes indulge, but prefer to give a specimen of our usual fare. And who shall say that we have not dined? Gravy? Of course. After the grease is poured off, the gravy is thickened by adding a little burnt flour and water, salt and the least dash of pepper. It is not always very gravy-ish, but it is all we require,—and I may add we all seem satisfied

HAPPY NEW YEAR.

On entering the new year we recall our resolutions of last year, and on examination find ourselves in some respects the gainers, although, after all, so far behind the mark, that again we set ourselves to form new ones for the year just opening. Instead of being discouraged by past failures, let us be encouraged to fresh efforts if we can mark ever so little progress.

But how few of the days that are gone would we be willing to take all in all and live over again. Each day comes and goes, and we say: "Surely to-morrow will bring us fewer mishaps, less hardships, more victories." And so we go on fighting the battle of life. To the household it is a battle with dust, with disorder, with the thousand and one things that men take no note of, but which are of vital importance to their comfort and well-being.

In every department of life the warfare is going on. To the man of science, peering into the stars or delving into the depths, it is a combat for fresh victories. To the artisan, to the farmer, to the professional man, in whatever branch his life-work may lie, it is one long-continued struggle, and it should be matter for rejoicing that man is so constituted that his happiness and highest development are, in a great measure, under his control.

Looking back on one, two, three years, we see but little advancement in our little world of domestic life; but take a sweep backward, say fifty and a hundred years, and hear what our

grandmothers tell us about heating brick ovens and cooking with blackened, smoke-bedimmed kettles on wide hearths, over blazing fires, when a tallow candle was a luxury that only a privileged few had, and then compare with those old-time kitchen inconveniences the household of to-day, with its ranges for cooking and well-lighted rooms. The thoughtful ones may well be wondering what is in the dim future, and whether the next century will bring additional light and comfort in our homes. We look at our children with almost a feeling of awe, tinged, perchance, with envy, as we reflect on the revelations that may open to them.

It does us good to take a broad outlook on life, reviewing the past and forecasting the probable future, while we who are occupying but a little speck in the cycle of the ages, see to it that we perform well our part, knowing that not one good endeavor will be lost.

News of the Week.

MISCELLANEOUS.

Monday, January 19, 1880.

Ulysses Johnson, who committed an infamous outrage, at Baltimore, on Elizabeth Riddle, aged 13, October last, and who fled to Virginia, was captured in Elliot City, Monday. . . Bogert, the late defaulting treasurer of the New York Produce Exchange, was formerly county collector of Bergen county, N. J. The freeholders of that county are now investigating his accounts, as there is reason to fear that he robbed the county by an over-issue of bonds amounting to $51,000. . . The moonshiners on Butler creek, in Wayne county, Tenn., have organized under oath to kill any revenue officer or marshall who goes into that locality. They killed W. A. Fowler for guarding Deputy Collector Davis and his friends. The revenue officers will not dare to go after wild-cat concerns in that region without a sufficient force to overcome any resistance . At Newark, N. J., the coroner's jury in a celluloid explosion finds that the accident resulted from the over-confidence of the experts of the company in their knowledge of the properties of materials which had not yet passed beyond the dangers of experiment. The management is censured for imprudence in allowing such experiments in a room filled with workmen and with such imperfect means of escape. Seven men were killed.

Order is gradually being restored in the Maine government. On the 16th inst. the greenback Legislature assembled and elected a Governor and State officers. The election resulted in a unanimous choice of Joseph L. Smith for Governor, who the same day took the oath of office administered by acting president Ellis, of the Senate. At a second joint convention, the State officers were chosen as follows:—P. A. Sawyer, Secretary of State; Charles A. White, Treasurer; W. H. McClellan, Attorney General; M. M. Folsom, Adjutant General General Chamberlain has again issued an order, contradicting the rumor spread abroad that the State House was kept by one party against another, and assuring the people that the rights and privileges of all parties and their members-elect should be protected with complete impartiality. Three companies are under orders from General Chamberlain, but will not be brought to the city unless needed. In spite of all this, the Supreme Court of Maine has decided in favor of the republicans who assembled and submitted certain questions concerning the situation to the court for decision. . A later despatch says: The whole aspect of affairs has changed and the hopes of a peaceable solution of the dispute by the decision of the Supreme Court are blown to the winds by the action taken by the Fusionists to-night. Soon after the points of decision were received from Bangor the leading fusionists had a consultation with Governor Smith and his staff, and before ten o'clock an order was issued revoking all previous orders by which General Chamberlain was placed in command of the State forces, and declaring that the commanding officers of all the military organizations accepted into the service of the State are required to report to the Commander-in-Chief, J. L. Smith. . . A still later communication received just as we go to press, reports a further change in the situation. Gen. Chamberlain, with all the other military officers refused to recognize Smith as Governor unless he could show credentials from the Supreme Court of the State, sanctioning his election. This, of course, he could not do, as the Court had already decided in favor of the republicans. Presently the republicans met and unanimously elected Daniel F. Davis Governor. Thus there are two rival governors in the State, each claiming to be duly elected, and to be the lawful executive. Mr. Davis informed Gen. Chamberlain of his election and sent him a copy of the decision of the Supreme Court sanctioning the action of the republicans. Gen. Chamberlain immediately resigned his trust in favor of Mr. Davis, as the recognized Governor and Commander-in-Chief of the State. The republicans thus have command of the militia, they have the support of the courts and of the clergy, and the control of the State Treasury, and all that is needed to complete their success is the submission of the Fusionists. To this end two propositions have been made: either to stamp them out at once by a vigorous move, or to let them linger on, assemble and make laws which nobody will respect, and finally die a natural death. Senator Blaine, who is the active leader of the party, is greatly in favor of subduing them at once.

Gen. Garfield was formally elected United States senator to succeed Thurman, by the Ohio Legislature last week. . . The Irish agitators, Parnell & Dillon, have been very busy during the past week The following appointments are definitely agreed upon, for meetings at which they will speak:—Up to the 17th inst., they were to remain in the New England States, ending with Providence They will be in Chicago on the 20th; Springfield, Ill. (Parnell alone), 21st; Detroit (Dillon alone), 21st; Toledo, Ohio, 23d; Buffalo, N. Y., 25th; Rochester, N. Y., 26th; Albany, N. Y., 27th; Troy, N. Y., 28th; New Haven, 29th; Springfield, Mass., 30th; Cambridge, Mass., 31st; Washington, D. C., February 2; Baltimore, 4th; Richmond, Va., 6th; Pennsylvania coal regions, 7th to 11th, inclusive; Altoona, Pa., 12th; Montreal, 15th. Mr. Parnell and Mr. Dillon will also visit the following places, but the dates of their visits are not fixed:—Ottawa, Toronto, Indianapolis, Cincinnati, Louisville, Lexington, Ky.; Memphis, Nashville, St. Louis and the West, as far as California.

A fatal explosion of coal gas took place on the 16th inst. aboard the steamship Greece shortly after she had arrived, and while lying at her pier at Hoboken. Two men were killed and several severely injured.

When Mrs. Chipeta Ouray, the wife of Chief Ouray, of the Utes, passed Alamosa, Col., eastward bound, she saw the body of a man dangling from a tree by the roadside. Mrs. Ouray was so shocked that she cried all the way to Chicago and would not be comforted. She reasoned that if the palefaces were in the habit of hanging horse thieves the tribe of her husband could expect no mercy.

Mrs. Latham, of Lynchburg, Va., having discovered that her husband was a Republican, sued for a divorce on that sole ground. The Corporation Court of Lynchberg decreed the divorce, but it was overruled by the Court of Appeals. Judge Anderson dissented on the ground that the husband had been untrue, having gone over to the enemy, and that the moral taint of his action would cause the wife to be excluded from the best society of the State.

FOREIGN.

Bismarck's condition causes much anxiety everywhere in Europe, but especially in Germany—rheumatism and an alleged general breaking up of his iron system. . . The French Ministry declares in effect that its policy will be anti-clerical, free trade, repressive of attacks upon the republic by speakers or newspapers; progressive at home and firmer but conciliatory abroad. . . There has been a good deal of fatal rioting at Pesth, Hungary. Herr Verhoway, a radical newspaper editor, was as much disliked by the nobility as he was popular among the masses. One of the nobles fixed a quarrel upon him, when Baron Maythenyi interfered, challenged and severely wounded him in a duel. The Baron is a professed duelist, the best shot in Hungary, and the populace say it was a "put-up job" to murder their favorite. The Casino Club of the nobles has been stoned; nightly mobs threaten violence; troops out heavily; shots fired; several deaths among the crowd; many arrests; considerable uneasiness; the Internationals believed to be at the bottom of the commotion. . . Out in Afghanistan the war seems to have assumed a guerilla character. Little organized resistance to the British in large bodies: but small detachments are attacked, difficult passes defended, and the whole country outside the invaders' lines, in confusion and turmoil. . . Montenegro is fighting hard for a strip of territory sliced off from Turkey by the Berlin Congress and given to her. The resident Albanians and Turks, however, refuse to be handed over, and are aided by their kindred and friends, so that there has been a mimic war going on. Both parties are brave and hard fighters, especially the Montenegrins. . . Starvation and turbulence stalk hand in hand in Ireland, and severer famine is threatened in the west of the island than that of '48. The distress is so great as to transcend the scope of private charity to relieve it, and the Government is about to start public works to give the men employment and wages. The poor-houses are being crowded, and several deaths from starvation have already occurred. Charitable contributions are pouring in from everywhere, but only in a thin stream, while the distress is oceanic. . . A Rome despatch says an agreement has been reached between Germany and the Vatican. . . Mr Mactear, who claimed to have discovered the mode of manufacturing diamonds, gives up his claim. Mr. Maskelyne, of the British Museum, decided that the supposed diamonds were composed almost entirely of silica and alumina, and Mactear, after first denying it, now agrees with him. . . The Queen of Spain has been attacked with epileptic fits, owing to the late attempted assassination of her husband, from which she, too, had a narrow escape. . . Gambetta was re-elected president of the French Chamber of Deputies, by 259 votes out of 308 being recorded.

Vast bodies of Russian troops are being concentrated in Poland This is considered a menace by Prussia and Austria but any hostile intention is denied by Russia. The fortresses along the Russian frontier on the west are being rapidly strengthened, and so are the defences of St. Petersburg. Many *rumors* of approaching hostilities. . . . Fever is epidemic in the north of Naples; in one district out of 62,000 inhabitants, 33,000 are prostrated. . . The New French Ministery is not pleasing to Berlin; its head, De Freycinet being regarded as a creature of Gambetta. The latter is losing popularity at home on account of a newly required pomposity. . . The London Times of a recent date contains notices of hunting appointments of 120 packs of hounds in England and Wales. This represents in one way or another an expenditure of at least $6,000,000. The cost of efficiently keeping up a first-class pack is estimated at $20,000 to $30,000 a year. Well fed dogs and a starving people!

Mr. Tennyson—of whom it has before been stated that he was a Spiritualist—is said to have so firm a conviction as to personal immortality that he cannot bear the slightest contradiction on that subject.

ENGLISH SALT.

The New York Produce Exchange Reporter, in commenting upon the fact that both the butter and cheese taking the sweepstakes prizes at the International Dairy Fair (for best made anywhere) was salted with Higgins's English salt, says:

"The product of these works is rapidly growing in favor with dairymen all over the country. We talked with several there from this State, Wisconsin, Iowa, Massachusetts and Maine, with a view to learn if they had any preference in regard to salt; most of them, who had for years used other kinds of salt, now preferred Higgin's Eureka; they pronounce it purer, finer, and say it can be more readily used than other kinds hitherto used by them, and gives better satisfaction in many respects, not the least important among which is, that it imparts superior keeping properties to the butter and cheese salted with it."

Another bit of testimony favorable to this salt is the result at the recent Massachusetts Butter Show, which, as shown in a recently published letter of Professor Alvord, is as follows:

"All but two of the twelve premium lots were salted with Higgin's Enreka Salt; one of the two with the American Dairy Co.'s salt; and the other kind of salt was not stated. This may be variously explained, but the fact deserves notice."

There can be no doubt but that the keeping properties of English butter and cheese, especially the latter, are quite remarkable, and the same is also true of the celebrated Danish butter, in which English salt is used, but whether it is all due to the salt or not is a question.

Dr. Voelcker, who is considered high authority in England, in a paper on cheese-making, says "the finest quality of salt should be used," and the difference in the cost of using the best salt per pound of butter or cheese, is so infinitesimal that it is not worth while taking any risk.

The Receipt

for Gilt-Edge Butter Maker was obtained from one of the most extensive dairy farmers of Ireland, noted for the excellent and superior keeping qualities of his butter, which was eagerly purchased by London dealers for export to India, where the warm climate puts butter to a very severe test. It has been thoroughly tried by a large number of the very best butter-makers in this country, and they have given it their emphatic approval. Price 25 cents per package. Sold by all store-keepers.

COLLINS, N. Y., Feb. 19th, 1879.

Gentlemen:—We churned one gallon of cream to-day at a temperature of 56 deg, using your Gilt-Edge Butter Maker. Time of churning, 15 minutes—result, 4 1-8 pounds of butter. Color, good. As we have not previously weighed our butter, of course we cannot tell whether there is a better per cent. or not, but appearances indicate it, and the quality is at least two cents per pound better. Yours, &c.,

M. E. WILBUR, Prop'r of Collins Creamery.

AN ARTICLE OF MERIT.—"*Brown's Bronchial Troches*" are the most popular article in this country or Europe for Throat Diseases and Coughs, and this popularity is based upon real merit. Imitations are offered for sale many of which are injurious. The genuine "*Brown's Bronchial Troches*" are sold *only in boxes*.

Temperance clergymen, lawyers, ladies and doctors use Hop Bitters, as they do not intoxicate, but restore brain and nerve waste.

The Markets.

THE GIST OF THE MARKETS.

WANT of space cuts short "Gists of the Markets" this week, but with the summary over the report at each place, this is a small loss. That probable tumble in wheat, spoken of last week, has come soon, hasn't it?—and there is plenty room below for more fall.

SPECIALS FROM ALL CENTERS.

Until Saturday, Jan. 17.

Boston.—Since last report corn, oats, rye and feed stuffs are about stationary; creamery butter steady, fall dairy-made a shade lower; winter dairy-made 2c. lower; other grades nearly unchanged; cheese generally a trifle higher; eggs steady; beans unchanged; potatoes from 3 to 5c. higher on some kinds, steady in others; hay steady; rye straw $1 lower.

CORN.—New 60@63½c. OATS.—No. 1 extra white 52@55c; No. 2 mixed 47½@49c. RYE 95c@$1. BUTTER.—New York and Vermont choice creameries at 30@33c. ₩ lb, fair to good 28@30c; Fall dairy made, choice at 26@30c. Winter dairy made at 20@23, Straight dairies, choice, at 23@25, dairies, common to good, at 18@22c, Eastern and PEIsland 18@22; Western—choice creameries 34@36c, choice dairy packed at 25@28c, choice ladle-packed 22@24, fair to good do 18@20c, common 15@17c. CHEESE, Choice Northern factory 13½@13c. ₩ lb, fair to good at 11@12c, and common 8@9c: Western factory—choice 12@13c, fair to good 10@11c, common 7@9c. EGGS Eastern at 22@23c. Northern 21@22c. Western 18@20c. ₩ dozen. BEANS.—Northern hand-picked Pea at $1 80@1 90 ₩ bushel; do do Western, at $1 75@1 85; do common $1 65@1 75; medium choice $1 55@1 60; common to good $1 35@1 40; Yellow Eyes $2 10@2 20; Red Kidneys at $1 75@1 85. Canada Peas 80c.@1 00 ₩ bushel for common to choice. Green Peas $1 50@1 85. POTATOES Houlton and Maine Central Rose 53@55c. ₩ bushel; Houlton Jackson Whites at 50c. Maine Central Jacksons at 48@50, Vermont Rose at 45@50 do Jackson at 45. Peerless at 45@50, and Prolifics at 50@53c. ONIONS $3 25@3 50 ₩ bbl. APPLES at $1 50@2 50 ₩ bbl, according to quality. CRANBERRIES at $6 00@8 00 ₩ bbl. CLOVER SEED steady at 8¾@9¼c. ₩ lb. for Western and New York; Timothy at $2 50@2 75 ₩ bag; Canary Seed at $2 45@2 85, and American Linseed $1 50@1 55 ₩ bushel; Calcutta $2 45@2 50. HAY AND STRAW first quality coarse Eastern and Northern at $16@17 ₩ ton; poor and medium at $11@15; Rye Straw $22@23 ₩ ton. SHORTS $20; fine feed and middlings $21@22.

Buffalo.—No report last week, so prices are not compared.

WHEAT.—No. 1 hard Duluth offered at $1 40@1 35 bid; CORN. No. 2 mixed 49@50c. RYE 89c. OATS No. 2 Western at 44@44¼. CATTLE, choice heavy $5 40@5 50; good shippers $4 45@4 75 mixed butchers' $2 65@3 25; closed with a steady downward tendency. SHEEP. Fair to good Western sheep $5@5 50 fair to choice Western lambs $6 50. HOGS good to extra Yorkers $4 60@4 82½; market closing week with 45 car-loads unsold.

Cincinnati.—Since last report wheat has fallen 4 to 5c.; corn 2c.; oats 1c.; rye from 1 to 2c. Western Reserve butter 1c. lower; other sorts steady; cheese unchanged; beans from 10 to 15c. lower for good to white; navy steady; feed, do.; hay lower all round; hogs from 20 to 25c. higher on all sorts.

WHEAT dull at $1 27@1 30. CORN dull at 41@43c. OATS firm at 39@41c. RYE dull at 88@90c. BUTTER, fine Western Reserve at 23@24c., and Central Ohio and Indiana at 20@22c.; fair to prime packing grades at 15@19. Common butter is selling at 12@14c. Creamery sells moderately at 35@37c. CHEESE—mild factory at 13@13½c. per lb, sharp selling moderately at 12@12½c. BEANS—Common at 75c.@$1 00, and fair to good white at $1 10@1 25 per bushel on arrival; prime to choice medium and navy selling at $1 40@1 50 per bushel on arrival, and $1 65@1 75 from store. BEESWAX dull at 20c. per lb. BUTTER quiet; creamery extra, 33@34c.; Bradford county and New York extra at 27@28c.; Western Reserve extra at 24@25c.; do. good to choice at 18@22c.; rolls quiet; Penn. extras at 21@23c.; Western Reserve extras at 21@23c. EGGS dull and steady; Pennsylvania at 18@19c.; Western at 18c. CHEESE firm; New york factory at 14@14¾c.; Western full cream at 13¾@13¾c.; do. good at 12@13c. DRESSED HOGS at 5¾@6c. CLOVER at 7@9¾c.; timothy at $3@$3¾; flax at $1.60. FEED.—Bran at $17.75@18.50.

St. Louis.—Since last report No. 2 red fall wheat has fallen 10c. for cash, from 8@8¾c. for Feb., from 8c to 9¾c for April; corn 1¾c. lower; oats, rye and barley steady. Light shipping hogs from 5c to 10c lower; other sorts unchanged; cattle somewhat higher.

WHEAT unsettled; No. 2 red fall at $1.25¾ bid cash; $1.28@1.28¾ February; $1.30¾@1.32¼ March; $1.32@1.34 April; No. 3 da. at $1.21. CORN weak at 35¾@35¾c. cash; 35¾c January; 36¾c. February; 37¾@37¾c. March; 41c. May. OATS at 37@37¾c. cash; 36¾@37c. January; 37¾c. February. RYE dull at 80c. asked. BARLEY—Choice at 75@80c.; fancy at 85@90c. HOGS steady; light shipping at $4.10@4.20; packing at $4.25@4.50; butchers' to fancy at $4.50@4 60; receipts, 10,300; shipments 1,500. CATTLE in active demand, but in light supply; yards cleaned out quickly; shippers were the principal buyers at $5.70; fancy steers, averaging 1,660 lbs., brought $5.40; other grades firm and unchanged; receipts, 900; shipments, 100. SHEEP—Supply fair, consisting of high grades, which brought $4.50@5.25 for good to fancy; receipts, 1,300.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 17, 1879.

BEANS AND PEAS.—Trade in beans continues to revive, and prices have a well set upward tone for all white. Red kidneys quiet, but not offered freely. Turtle soup beans quiet. Receipts of beans begin to favor sellers. Green peas hold their strong position; q. oted, $1.80 at station and $1.85 from store. Southern B. E peas nominal at $2.25 per 2 bu. bag; marrow beans, prime, $1.65@1.70; other, $1.45@1.55; medium, prime, $1.52½@1.55; other, $1.35@1.40; pea, $1.45@1.70; w. kidney, $1.70@1.90; red, do., $1.60@1.70; black, $1.70@1.75.

Receipts of beans for week, 4,620 bush.; exports, 700 bbls. and bags.

BEESWAX.—Small lots have been placed at 24¾@25¾c. for Western and Southern,

BROOM CORN—There is not much demand, but receipts are moderate, and prices showing firmness. Prices are for choice brush at 9c.; choice hurl at 8c.; stalk braid at 6@7c.; mixed red and green at 5@6c.

BUTTER.—In a general way State butter is quiet. Sellers have been breaking up dairies in order to make the higher rates for fine table stock, and there are a good many bodies of dairies that hang at the prices when fine high-grass-fed Western can be found to fill grocers' wants. Creamery is steady for first-class use, but any grade at all under fine sinks into the cheaper scales. There has been a fair export call taking 5,000 packages. This trade at the moment is not giving the attention to fair and medium goods that would be desirable at this part of the season. All common lines of Western factory show weakness, and there are many remnants of State that would have to be marked off to sell. There is very little Eastern demand. Dealers whose winter trade has heretofore counted largely upon New England custom, find themselves supplanted by oleomargarine. The outlook is certainly not propitious for the speculators who went in on the last end of the stock. The earlier operators will have command of the market, at least until their finest reserves are used up. Fresh made State brings 26@27c. Rolls are dull, the weather being bad for handling them, even when they are well wrapped.

State pails and tubs, choice, small lots, 29@30c.; fair to prime, 24@28c.; full dairies, choice, 27@28c.; fair to prime, 22@23c; firkin dairies, choice, 25@26c.; other, 22@24c.; Welsh tubs (including late made), 22@27c.; poor State, 20@22c.; creamery, fancy, 30@37c.; fair to prime, 27@35c.; poor, 23@25c.; sweet cream, 33@34c.; Western imitation creamery, 25@30c.; dairy, fresh, 26c.; other, 19@25c.; factory, finest, 21@22c.; other, 18@20c.; very poor Western 12½@17c; rolls, 18@22c

Receipts for week, 25,100 packages.

CHEESE.—Shippers have taken this week 26,646 boxes. A slight advance has been made in prices with the moderate stocks. Low grades are scarce and wanted chiefly.

Quotations for State factory are: Fancy, 14@14¾c., good to prime, at 12¾@13¼c; fair to good, at 12@12¾c.; half-skimmed at 10¾@11¾c. State farm dairy: Good to prime 12½@13¼c; fair to good at 11¾@12¾c. Wis. factory: Fine, 13¾@14c.; good to prime 12¾@13¾c. Ohio factory: Cheddar, fine, at 13¾@13¾c.; do., fair to good, 11¾@12¾c.; flat, fine, 13¼c.; flat, good to prime, 12¾@13¼c.; flat, fair to good, 11¾@12¾c.; half-skimmed, 10¾@11¾c.

Receipts for week, 26,930 pckgs; exports, 29,000 do. Liverpool cable, 7½ higher. Steam, 25s.

COTTON.—The market has been irregular, and closed weak, with, however, large dealings; latest prices are for Jan. 12.84@12.85c.; Feb. 12 94@12.95c.; March, 13.17@13.18c.; April, 13.38c.; May, 13.56@13.57c.; June, 13.72@13.73c.; July, 13.82@13.84c.; August, 13.93@13.94c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—Apples have shown some little export demand for evaporated lots, and for which prices are strong; otherwise the market is quiet, and small sales only. Prices are For Apples—New North Carolina, at 7@9c. for fair to good; 10@10¼c for choice; 11c. for fancy sliced. Patent evaporated, apples, choice, in cases, at 15c.; do. good and prime, 13@14c.; N. Y. State sliced, new, 7¾@8¼c.; do, quarters, choice, 7@8c.; new southern quarters, scarce and nominal; new North Carolina peeled peaches 17@19c., do., Georgia, 13¾@16¾c. Peaches, Delaware evaporated, peeled at 24@28c.; do, unpeeled at 11@16c.; new halves at 8@8¾c. Blackberries at 9@10c. for new. Raspberries at 26@26½c. Pitted cherries at 18@19c.

Exports for week, 600 bbls. apples,

EGGS.—Receipts for the week, 4,585 bbls.; do. last week 6,377 do. There is no certain demand for any but strictly fresh; such sell upon arrival. An abundance of State stock is offering at 14@15c. Southern fresh have a good demand, but shippers neglect to put them up attractively.

Near points 20@21c.; State and Pa.; 17@19c.; Western, extra, 18c.; fair to good, 15@16c.; Southern, 16@18c.; limed, State, 13@14c.; Canadian, 12½@13½c.; Western, 12@13c.

FEED.—Sales of 40 lbs. at $21@21.50; 60@80 lbs. at $21.50@23; 100 lbs. at $21@23; rye feed at $13@20.

FLOUR.—There are decidedly lower prices on the break in wheat, and very slow buying.

Latest prices are $4.85@5.40 for inferior to very choice superfine State; $4 40@5.60 for inferior to good extra do., odd lots and lines; $5.40@5.20 for very good to very choice do.; $4 85@5.40 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $5.10@5 60 for inferior to good shipping extra do., and $5 10@5.90 for good to very choice shipping extra do.; inferior to about choice white wheat extras $5.75@6.65; choice to fancy do. $6.75@7.75; red and amber winter wheat, inferior to fancy trade and family, at $5 75@7.50; round hoop Ohio, $5.70@6.00; and trade and family brands of do. at $6.10@7.45; the latter rate for fancy; St. Louis at $5 85@6.50 for inferior to good extra; $6.50@7.75 for good to fancy; Minnesota clear, very inferior to fancy, at $5 65@6.65; Minnesota "straight," very inferior to fancy, at $6.15@7.75 and patent poor to very fancy, at $6 65@9 00; unsound stock at from $5 35@5 50; city mill extra at $6.40@6.75 for fair to very choice for West Indies (fancy do. quoted at higher figures); do. for England, $5.45@5.75 for poor to choice; do. trade and family extras, $6.75@7.75; do. for South America, $6.60@7.00; No. 2 at $3.85@4.50 for poor to choice.

CORN MEAL.—Is selling at $3.30 for Brandywine; and $2 50@3.10 for Western.

FRESH FRUITS.—Trade in apples has fallen into a lull at a bad time. Stock has spoiled badly and dealers will have to try and make good stock pay for prior sales. This, however, is not the comfortable style of commerce that a ready winter sales would afford. Shippers are about done; prices here and abroad are against them. Prices easier for all grades. Spitzenbergs, ₱ bbl., $3@3.50; Baldwins choice, $2.75; other, $1.75@2.50; Greenings range, $1.50@2.00. Cranberries firm, though not in large demand. Stock mainly here. Cape Cod, fancy, ₱ bbl., $8.50@9; other capes and Eastern, bbls. $6.50@8.25; N. J. crates, $2@2.50. Grapes hardly wanted; prime Catawbas, $2.75@3 ₱ case; poor, $2@2.50. Florida oranges dull, with the disadvantage of having to be repacked to sell. But hf. bbl. cases, $3.25@3.50; other, $2@2 75, as they run. Peanuts not so active, but sellers can stand a lull after the late free business. Va., hand-picked, 5½@6½c.; good to fancy, 4@4½c. Hickory nuts, 75@80c. Pecans, 10@10½c. One hundred quarts of Fla. strawberries arrived on Thursday; best bid, 75c. ₱ quart.

GRAIN.—Wheat broke sharply on the large supplies here and at the West, and has been feverish and irregular, closing, however, stronger; latest sales are of No. 1 white at $1.42@1.43; do., January, at $1,42½@1.43; do., February, at $1.44½@1.45½; do., March, at $1.47@1.48¼; ungraded white in store at $1.38@1.45; No. 2 red at 1.44¼@1.47; do., January, at $1.41¾@1.45½; do., February, at $1.46@1.48; do., March, at $1.49@1.51; No. 3 red at $1.37; ungraded red at $1.30@1.47; No. 2 Milwaukee spring at $1.41; New York No. 2 spring February, at $1.36; New York No. 3 spring at $1.33@1.35; ungraded spring at $1.42. Rye at 92¾@93c. for No. 2 Western. Corn has been more freely offered and closed at a decline; latest sales are of No. 2 at 61½c. do. new at 59¾@60¼c; do., January, at 60¾c.; do., February, 58¾@58¾c; do., March, at 58¾@58¾c.; do., May, at 57¾c.; New York steamer mixed at 57¾@58¾c., do., January, at 57¾@58c.; do., February, at 57½c.; ungraded mixed western at 56@61¾c.; New York No. 3 at 56@56¼c.; round yellow at 58c. for new; steamer yellow at 58c; No. 2 white at 60c; steamer white at 61¾c. Oats have favored buyers with free sellers; late t sales are of No. 1 white, at 48¾@49c.; No. 2 white at 47¾@47¾c.; No. 3 white at 47¾c.; New York No. 2 at 47@47¼c.; do., February, at 47¾@48c.; New York No. 3 at 46c.; ungraded white western at 47¾@49c.; ungraded mixed western at 46¾@48c.; white State at 48@50c.; mixed State at 47c.; No. 2 Chicago afloat, at 47¾c. asked.

HOPS.—Emmet Wells, in his circular, says:—"There is a trifle better feeling, without any marked improvement, in the demand or any change in values. At considerable expense and trouble we have succeeded in procuring through our custom-house broker the number of bales of hops exported during the season from outside ports. The following are the figures, viz.: San Francisco, 2,000 bales; Boston, 1,930 bales; Philadelphia, 1, 925 Baltimore, 599 bales; total, 6,502 bales; add New York shipments, 40,380 bales; grand total, 46,982 bales. In round numbers England has taken from us 47,000 bales since September last; at least 12,000 bales of these were old hops, so that we have really parted with only 35,000 bales of our new crop, which is not so big a draft as some people would suppose. Putting the new crop at 200,000 bales (which is the lowest estimate we have seen) there would be for home use 65,000 bales new, and these added to the 35,000 bales of old in the hands of our brewers and dealers in September last go to make up the year's home requirements. From the foregoing it would seem that we cannot now spare many more hops for export without encroaching upon the supply required by our home brewers between now and the next crop, and any important increase in the demand from London will naturally tend to advance our prices."

Total receipts for same period in 1878	43,024
Export clearances for the week	684
Total exports since September 1, 1879	40,480
Total exports for same period in 1878	16,122
Imports for the week	none
Total imports for the season	1,008

HAY AND STRAW.—Receipts are moderate, demand good and steady, and prices strong. Shipping hay quoted at 75c.; retail lots at 80@85c. for medium, and 85@90c. for prime; clover at 55@60c Straw at 90@95c. for long rye; 65@70c. for short rye, and 55@60c. for oat.

OIL-CAKE.—Western is quoted at $34.

POULTRY AND GAME.—Supplies of good dressed have been small and prices have ruled steady. High rates are not to be expected for odd parcels as the trade will run to regular receivers from this time on. Fine chickens and small turkeys lead the demand. The 6@9c. quotations are for remote freight stock, Turkeys, N. J., 12@13c.; State, Mich., Ohio and Penn., 12@12½c.; other Western, 10@11¾c.; Philadelphia dry picked, 13@14c.; do. chickens, 13@14c.; N. J., 11@12½c., State and Western, prime, 10@11¾c.; prime to fair, 8@9c.; Phila. fowls, dry picked, 11@12c.; N. J. 10@12c.; poor to prime other, 6@10c. Ducks, choice, 15@16c.; other, 10@14c. Geese, choice, 12@12½c; N. J. and State, 10@ 2c.; Western, 8@10c. Squabs, white, ₱ doz., $2.50@2.75; dark, $1.50. Capon, large, 20@22c.; small and slips, 16@18c.

Supplies of live are small, and fair prices are ruling as city killers have some demand for fresh dressed. Fowls, 10@12½c.; roosters, 6@7c.; turkeys, 10@12c.; ducks, 50c.@$1; geese, choice, $1.75; other, 1.12@$1.62; pigeons, fair, 30@35c.

There is a strong market for the few remaining sorts of game, quail and grouse specially high.

Canvas back ducks, 2.75@$3; Havre de Grace, $2@$2.50 Northern Western; red head, 75c@$1.25; Mallard, 50@80c.; black 50@75c.; teal, 30@50c.; common, 30@40c. Quail, $3.50@3.75. Partridges, prime $1@1.15; other, 85@95c. Grouse, $1.25@1.37. Wild pigeons, light, prime, 1.25@$1.37 acorn fed, $1.00 Rabbits, 25@30c.; Hares, 25@30c.

PROVISIONS.—Hog products have been active and tending higher. Mess pork quoted at $13 45@13.55 for new mess for January; $13.50@13 60 for new for February, and $13 60@13.70 for March and $13.70@13.80 for April. Bacon at 7¼c for long clear and 7¾c. for short clear. Lard—Western steam at $7.75 for spot; $7 92½@7.95 for January; $7 92½@7 95 for February; $8.05 $8.07½ for March and $8.15@8.17½ for April. Stearine at 7¾@7¾ for Western. Tallow at 6¾ for prime. Beef Hams at $16.50. Beef—Extra mess at $11@12; plain mess, $10.50@11; packet, $13@13.50; tierced beef, city extra India mess, at $21.50@23, and Philadelphia do. at $21.

Receipts for week, pork, 2,140 bbls. Beef, 1.189 pkgs. Cut-meats, 32,068 do. Lard, 8,464 do. Dressed hogs 4.96; do.

SEEDS.—Clover is easy and quoted 8c.@9c. for prime, and extra choice Western, and 9¾ for fancy. Timothy is quiet at $2.75@$3.

TOBACCO.—Export movement is somewhat better, and the market is firm generally.

VEGETABLES.—Exports for week 5,233 bbls.; of onions 70. Prices have advanced for potatoes. The South has bought seed quite liberally during the week.

Nova Scotia E. Rose, bulk bbl. $1.75@$2.00; do. Prolific, do., $1.50@1.62; do. Mercer, $1.25@1.37; Main, Early Rose, do., $1,75@2.00. State, do., $1.62@$1,75 do. b. $1.37@1.62; State Peachblows, red, $1.87@$2 00; do. white, $1.75@1.87; Snowflake, $1.50@1.62; State Peerless, $1.25@$1.62; N. J., do., 87c.@$1. Norf. spinach has sold at 1.50@$2 bbl.; kale, $1. Onions prime yellow scarce. Squash, marrow, bbl 1.25@1.50. Hubbard, $1.25@1.50 ₱ bbl.; cabbage, $1@7 per 100. onions, white per bbl., $3@4.50; yellow, $3@3.25; red, $2.25@$2.50; Chester, $1.75@$2.25. beets, $1@1.50; Russia turnips and carrots, 75c.@$1; celery, per doz., $1@2.

WOOL.—There has not been much activity as yet this week, but prices have ruled very strong. Quotations are for domestic fleece:

Ohio, Pennsylvania, and West Virginia—XXX, 55@58c.; XX, 51@55c.; X, 50@53c.; No. 1, 55@57c. No. 2, 47@50c.; coarse, 43@46c.; combing, 53@57c.

New York, Michigan, and Wisconsin—XX, 47@50c.; X, 47@50c.; No. 1, 52@55c.; No. 2, 46@50c.; coarse, 38@40c.; combing, 50@54c.

Indiana, Kentucky and Tennessee—X and XX, 46@50c.; No. 1, 52@55c.; No. 2, 46@50c.; coarse, 38@40c.; combing, 50@54c.; combing unwashed 37@42c.

Illinois, Iowa and Minnesota—X and XX 43@47c.; No. 1, 48@52c.; No. 2, 43@45c; coarse, 37@40c.

Georgia, Alabama, Mississippi and Louisiana—fine unwashed, 43@45c.; medium unwashed, 40@43c.; coarse unwashed, 30@33c.; burry, 18@24c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Jan. 11.

BEEVES.—Receipts for the week, 12,423 head; do. last week, 10,216 do. The week has been a dull one, and closing prices are fully ¼c. lower than for Wednesday's market. Common and medium stock suffered the most trade neglect, were kept over for Monday. Dry cows and rough oxen sold at 7@8c., dress 55@56 lbs.; poor to fair steers, 7¾@9c., dress 55@56 lbs.; good to prime, 9¾@10¾c., dress 56; choice and above, 10¾@11c., dress 57–58 lbs. Export wants improving.

COWS AND CALVES.—The demand is merely a chance affair. Receipts include some Southern stock, which sells low. The range is $30@60. very few making the extreme; good quality milkers considered well sold at $45@60.

VEAL CALVES.—There have been no great additions to the arrivals of live, and as soft weather has kept back hog-dressed, firm prices prevail throughout. N. J. and Bucks Co. live, choice, 8c.; fair to prime including State, 6¾@7¾c., with a few State at 8c.; Mount Holly at 6¾, 300 lbs., down, 5@8c. Hog-dressed, choice, 10@10¾c.; other, 8@9¾c.; buttermilk, calves, 4@5c.; grass, 3½@3¾c.

SHEEP AND LAMBS.—Receipts for the week, 29,993 head; do. last week, 21,832 do. The increase was more than the market could carry in a warm week, and a low, easy market is reported. A decline in pitts also tended to weaken car-load prices for sheep. About one-half the supply sold up to Friday night. Sheep ranged at 5¾@6c.; lambs, 7@7¾c.

SWINE.—Receipts for the week, 30,614 head; do last week, 29,914 do. Light Ohio hogs sold at 5c.; quoted at the yard, $5.00@5 20 per 100 lbs.

Light country pork, 6¾@7¾c.; medium, 6¾@6¾c. heavy, 5¾@6¾c.; city dressed, 6¾@6¾.; Western dressed, 5¾c. The latter arriving in poor condition. Pork tenderloins, 11@12c.

CAT-TAIL MILLET,

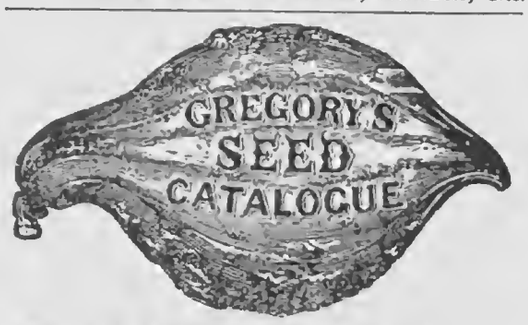
ALSO KNOWN AS

"HORSE" or "PEARL" MILLET,

50c per lb. by mail, 25c. by express. Chufas, 50c. per qt. by mail. Send for price-list of many new and improved Standard Seeds.

MARK W. JOHNSON, & CO.,

27 Marietta Street, Atlanta, Ga.



My Annual Catalogue of Vegetable and Flower Seed for **1879** rich in engravings, from photographs, of the originals, will be sent FREE, to all who apply. My old customers need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. *Full directions for cultivation on each package.* All seed *warranted to be both fresh and true to name*; so far, that should it prove otherwise, *I will refill the order gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables, I invite the patronage of *all who are anxious to have their seed directly from the grower, fresh, true, and of the very best strain.*

NEW VEGETABLES A SPECIALTY.

JAMES J. H. GREGORY, Marblehead, Mass.

THE NEW

ELASTIC TRUSS

Has a Pad differing from all others, in cup shape, with Self-Adjusting Ball in center, adapts itself to all positions of the body, while the Ball in the cup presses back the Intestines just as a person would with the Finger. With light pressure the Hernia is held securely day and night, and a radical cure certain. It is easy, durable and cheap. Sent by mail. Circulars free.

EGGLESTON TRUSS CO., Chicago, Ill.

Halladay Standard.

VICTORIOUS AT

Phila., 1876—Paris, 1878

25 Years in Use.

GUARANTEED SUPERIOR

To any other Windmill Made.

17 SIZES—1 MAN TO 45 HORSE POWER

Adopted by the leading R. R. Co.'s and by the U. S. Govt. at Forts and Garrisons.

$3,500,000 worth now in Use.

U. S. WIND ENG. & PUMP CO., Batavia, Ill.

WINGER'S IMPROVED

WIND-MILL FEED GRINDER.

Operated by pumping Wind-Mills. A novel and perfect feed mill for grinding all kinds of grain for stock and house use. Cheap, reliable and durable. Agents wanted everywhere. Also the old and reliable Stover, the well tried, strong, durable and self-regulating, solid wheel WIND-MILL, which took the Centennial diploma as well as grand medal. Branch office, Greencastle, Pa. Send for catalogue to STOVER WIND ENGINE CO., Freeport, Ill. E. B. WINGER, Gen. Manager.

THE

Ferguson Bureau Creamery

Correct in Principle. Perfect in Operation.

Awarded International Diploma at the Dairy Fair, 1879.

It maintains a perfectly uniform temperature at 60°
It increases the production of Butter fully 10 per cent.
It makes Butter unexcelled in texture, flavor and keeping qualities.
It requires the least labor of any system.
It will last twice as long as any other apparatus.
It is a perfect Refrigerator for Cream and Butter.
It can be used with either ice or water.

☞Send for large circulars giving full particulars and many other testimonials.

THE FERGUSON MFG. COMPANY,

AGENTS WANTED. Burlington, Vt.

International Dairy FAIR

PRIZES.

Both the Sweepstakes Prizes, at the International Dairy Fair, just closed, "for the best butter and cheese made anywhere," were salted with English salt (Higgin's Eureka brand), as were also most of the other lots taking prizes. Higgin's Eureka Salt took the first prize at the Centennial Exhibition, 1876, the Paris Exhibition, 1878, also at the Fair of the British Dairy Farmers' Association, London, 1879; Royal Irish Dairy Fair, Dublin, Dec. 10, 1879; and at more than forty State and County Fairs in the United States.

The British Government has granted a patent to Thomas Higgin for an improvement in salt manufacture, and the consumption in this country has risen in three years from 6,000 to over 70,000 sacks, while during the same time the consumption of brands heretofore thought to be the best, has largely decreased. If this means anything, it means that Mr. Higgin's improved process is working as great a revolution in salt as the Bessemer process has in steel, or new process milling in the manufacture of flour. The difference in the cost of using the best salt for butter and cheese is too small to be considered a moment (being less than one thirtieth of a cent per pound on butter, and one-sixtieth of a cent per pound cheese).

The prize cheese and butter salted with Higgin's salt sold for an extra price more than a hundred times this amount: therefore

It Pays

to use the best salt. Factory men who manufacture for their own account cannot afford to use cheap salt, and milk producers who have their butter and cheese made up for a certain price can afford to pay more if Higgin's Eureka Salt is used. It is the purest, strongest, and most uniform grained salt ever manufactured, and instances of the keeping properties of butter and cheese made with it have been quite remarkable.

Ask your dealer for the Illustrated Dairyman's Almanac, for 1880, describing how salt is manufactured. If he is unable to supply it, a postal card to the undersigned will receive attention.

H. K. & F. B. THURBER & CO.,

Importers, New York.

B. P. & C. E. BAKER,

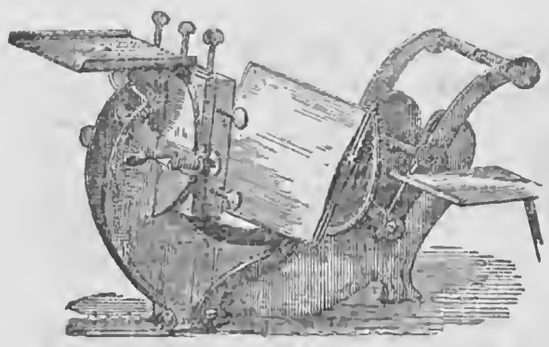
Western Agents, Chicago.

For Sale by nearly all Dealers in Salt.

Reading for the Young.

THE KELSEY PRINTING PRESS.

HERE is a premium that the young people will regard with great favor, and they will be entirely justified in doing so. It is a complete printing-press, in a small way, and we selected it as a premium with a special view to please the boys. With this press they can print cards, labels, addresses on envelopes, etc., for themselves and their friends, in any style desired.



The illustration shows just what the press is. The bed-plate is 3x5 inches; that is, anything as small as one line of type, or as large as a postal-card may be printed, and printed well, if the operator is expert. There are all conveniences furnished with the press, including metal "rules," an inking roller, two boxes of ink, one of lye, etc. We use one of the presses in our office for small work, and it suits us exactly so far. The price of the press is $10. We offer it to anybody who will send us a club of eighteen subscribers. It is made by Kelsey & Co., Meriden, Conn.

THE FRUIT GROWER'S FAMILY.

Esther's School of Pets

REV. HENRY S. CLUBB.

As stated in my first article on "The Fruit Grower's Family," Esther invited me to witness the performances of her School of Pets, and as all young people of refined taste, take delight in pets of some kind, I will now tell you what I saw in a recent visit to this happy family. The weather being too cold for the school of pets to be held in the open air, where it is usually held Saturday afternoons, Esther, knowing my desire to see he school in session, arranged to hold it in a room which had recently been added to the house for an office, as her father had been elected Township Treasurer, and he would require a place where to transact the business. He had not yet occupied it for this purpose, and there was nothing in the way of Esther using it for her exhibition of pets.

The scholars were a cat, a sky terrier, a parrot a large-tailed squirrel, and a chipmunck. All those she had been training so as to be on friendly relations with each other, to subdue their natural tendency and control their conduct in each other's company so as to abolish all fear on the one hand and ferocity and cruelty on the other.

Esther arranged two chairs about six feet apart at one end of the room, the backs towards each other, on the tops of which rested a heavy pole. On one chair sat the squirrel and on the other the chipmunk which was her newest scholar, having been caught last. On the floor on one side was the terrier and on the other side of the floor, the cat, while the parrot sat on a cross perch standing in front.

Several other friends were present to witness the performances and we, the visitors, sat at the other end of the room. Esther whispered something to the parrot who immediately repeated in a loud sharp tone the order: "Chippy run up." The chipmunk was a little disconcerted and did not at first notice the order. The parrot immediately cried in a loud voice, "*Chippy run up!*" So sharp and shrill was this said that the poor little timid chipmunk immediately ran up the back of the chair and across on the pole. He reached the opposite chair and looking down saw his rival, the large-tailed squirrel awaiting orders. The parrot then acting under the orders of Esther cried out. "Neddy jump up," and immediately the squirrel was upon the cross pole. Quick as lightning Chippy made way for his friend Neddy, by swinging under the pole, and Neddy reached the other end quicker than we could write the fact even in short hand. Then both squirrels ran towards each other meeting at the center of the pole, and this time Neddy swung under and let Chippy run over. They continued to repeat this operation running backwards and forwards on the pole and alternately running over each other and making way by swinging under with great rapidity. Esther said it had been very difficult so teach them thus to pass each other on the pole as at first, when they met they used to quarrel as to which should go under. They at last settled on this plan of taking turns and since then they had not quarrelled. They then stood side by side on the pole making bows to the company who furnished them with an ample supply of ground nuts which they dexterously caught, running down each time to his own chair to deposit each nut caught, in a little box placed there for the purpose.

When his part of the performance was over, the parrot said "Well done, Neddy. Well done, Chippy, you may now eat some of your nuts, but don't forget poor Poll." At this instant Neddy came to the centre of the pole and politely handed a nut which was taken by the parrot with a "Thank you, Neddy." Then, Chippy, not to be outdone in politeness repeated the operation which seemed to please Polly very much as she literally screamed her gratitude.

The dog and the cat had all this time been quietly watching what was going on and awaiting their turn in the performance. The parrot now after receiving a hint from Esther, gave an order to the cat "Puss you fetch your chickens." Puss looked towards a basket at the corner of the room and at this moment the lid of the basket was removed, probably by a string, one end of which was held by Esther's little brother, Harry, who was fond of playing this little trick, when out jumped half a dozen chickens about half grown or size of bantams. Puss walked lazily towards them and they immediately surrounded her. One, a young rooster, more daring than the rest, jumped on her head and made a most ludicrous attempt at crowing. One of the pullets caught pussy by the tail, and the others pecked at her without hurting, just to show the exuberance of their joy. Puss stood it with the greatest composure, and made no effort to check the enthusiasm of the reception, but seemed rather to enjoy it. Polly was greatly excited to see this performance, and so indeed were all the spectators, who inquired of Esther how she had managed to make the cat and the chickens such good friends.

Esther explained that the chickens, when quite young, lost their hen-mother and she had brought them in to take care of them, and as Puss had recently lost her kittens, she immediately conceived the idea of letting the cat foster the chickens. Puss was not adverse to this and had brought them up tenderly and kindly, never once attempting to injure or kill them, and they, in their turn, had learned to treat the cat as their mother. They had now become so big that they did not need her care, so they simply played when they met, from old acquaintance. Several of the brood had died from getting smothered under pussey's soft fur, literally killed with kindness, and only six remained of the ten hatched. When the chickens were making towards the door, Polly called to Prince, the dog, with a kind of whistle, and Prince sprang up and prevented their escape by placing himself near the door until it was closed. Esther said she had trained Prince to keep the school together and to keep off intruding dogs or cats when the school was held out doors, as it is in warm weather.

In the evening we had a pleasant time with the Fruit Grower's family. At supper there were four kinds of canned or preserved fruit, peaches, quinces, raspberries and cherries, and we found that both Amy and Esther had learned to do the canning and preserving.

The conversation related to a great many subjects. Esther told us how she had trained her pets by treating them kindly. She had, when in New York, heard a good deal of the "Happy Family," which Barnum used to exhibit at the Museum on Broadway, and thought she would see if creatures of such different disposition could be trained to live happily together, and although it required great perseverance, she had succeeded better than she had ever expected. She had also preserved accounts cut from the newspapers of extraordinary freaks with domestic animals, where the young of one had been taken care of by the maternal instinct of an entirely different specie and even of antagonistic dispositions. These accounts she had made a collection of in her scrap book, and now had over a hundred different incidents showing both intelligence and affection in domesticated animals, some of which would be creditable to the higher order that claims to monopolize the wisdom of creation.

The crop of fruit this season was exceedingly good and the Fruit Grower's Family were happily in enjoying intelligent pursuits during fall and winter, the ample reward of their well directed industry during the spring and summer months. Amy was making good progress with her botanical studies and school, and John was preparing a large number of grafts to plant in the spring in his nursery, having been encouraged by the success of his first efforts.

THE STORY OF AN OWL.

IN some places in England there exists a cruel custom which shows not only ignorance, but ingratitude. I mean the custom of farmers and others who nail alive on the door any owls that come in their way. In this, they not only commit a cruel action, but they also deprive themselves of a friend, who rids the fields and gardens of destructive insects and vermin.

One day, when on an excursion in the neighborhood of Windsor, I found an owl fastened up to a barn door, which seemed to be at the point of death, for it had been there two days without food, and both its wings were pierced through with large nails. I wanted to take the poor thing down from its gibbet, but the farmer came running up to stop me.

At length I persuaded him to let me have the bird. I set to work to release the owl, who, not understanding my charitable intentions, scratched my hand severely with its claws. The farmer went away laughing, which did not hinder me from drawing out the nails and delivering the poor bird which I put in my handkerchief. After this I laid it on the grass, and poured down its throat a few drops of water, which appeared to refresh it.

It seemed to understand my good intentions towards it, for it soon allowed me to touch it without moving. I washed its wounds and wrapped up its right wing, which was broken, with a bandage made at the expense of my handkerchief. The owl, its eyes bloodshot through suffering and fever, regarded me with much surprise. I went to a tree and shook down a lot of insects, which I offered to the owl, who gobbled them up greedily, and then I returned home with my singular acquisition.

It was a female, still young, of the common tribe generally known as the barn owl. Red and brown characterized its plumage. Its breast was shaded with red, getting more brown as it descended. The tail, too, was reddish and covered with bands of a deeper hue.

During this examination, the poor bird got out of its basket and hopped with difficulty on to the back of my arm chair. Having installed itself comfortably, it began to arrange its disordered plumes and looked at me fondly with great eyes, whose pupils kept dilating as the shades of evening drew on. I went up to her and stroke her gently on the back. She received the caress with an evident satisfaction, and returned it by rubbing her head gently on the back of my hand. From that time a compact of friendship was made between us and Strix—for I gave her the ornithological name—soon became to me a tender and faithful companion. She never failed, when I opened my window in the morning, to fly out for a few minutes, and returning to my dressing room, dabbled with delight in a bashful of water, and took the greatest pains with her toilet. She then proceeded to breakfast on insects produced by the gardener, and sometimes pieces of fresh meat. Then she used to take her accustomed place on my arm-chair. From this post she followed my slightest movements and lent the greatest attention when I wrote. If I got up, she leaped on my shoulder and accompanied me. If I was obliged to go out, she used to put her head between her wings, but directly I returned would overwhelm me with signs of joy.

Although her broken wing would not allow her to fly long distances, Strix, especially on fine evenings, used to allow herself airy excursions to the roofs of neighboring houses and back. On one occasion she did not return until next morning. From this time she became restless and feverish, no longer sleeping during the day, as her custom used to be.

One evening I caught her breaking up my waste paper basket, which she carried away piece by piece. Then she commenced her nocturnal excursions, which she prolonged into the next day and did not return for her food until the evening and then disappeared

This manner of proceeding made me curious. After two or three days' watching, I discovered that she used to take refuge in a neighboring garden. One morning at break of day, I saw Strix going across the trees towards a ruined tower. I gained the summit by some broken steps, and, to my delight, beheld Strix offering from the food she had got from my house, mouthfuls to four little birdlings covered with down, who opened their yellow and insatiable mouths to their widest extent.

The fugitive was not at all startled at seeing me at her nest. She continued her distribution peacefully without ruffling herself. This duty fulfilled, she raised her head softly, and turned on me her great, golden eyes, full of tenderness.

From that time I regularly carried to the young mother such scraps as I knew she liked. Soon the little ones recognized my steps and noisily hailed my arrival.

The husband himself, reassured by my intentions, acquiesced in the amiable compact which bound me to the family, and every morning we all seven fraternized with a friendliness with which, I was not a little touched.

One day, to my great astonishment, I found all six installed in my library. Although sensible of this proof of their affection and confidence, I must confess I felt somewhat embarrassed. Nevertheless, I thought it only honorable to fulfill the duties of hospitality and served my guests with meat, cut in strips and a piece of beef that my cook was going to roast for my dinner the next day. My six guests having finished all I had to give them, the father and his four children began to flap their wings, a sign of their departure, and flew away, leaving Strix with me, who, from that time, resumed her old habits, as if she had never left them.

One day, as I came home about one clock, I heard up stairs some most discordant cries, which made themselves heard in the court. I ran up stairs and opening my window saw poor Strix on the balcony assailed by hundreds of sparrows. They attacked her with great blows and tore out her feathers without their victim (who was blinded by the sun, which struck right on the window) trying even to repel them, or defend herself. My presence put the little army to flight, and I took in the wounded owl, who did not recover herself for full an hour afterwards.

Strix lived many years after this. She met with several adventures, the chief of which was her being stolen from a stone coping where she was very fond of taking a nap.

I suppose the man who took her had been prepared beforehand and had thrown a sack over her head, or else she would have been sure to have given the alarm. After some days' non-appearance, I thought her gone forever, and I do not think I should have seen her again, but that I happened to walk shortly afterwards through Leadenhall market. I thought I heard a familiar shriek and sure enough, there she was in a cage outside a shop. I went into the shop and put some questions to the man, who, however, asserted he knew nothing about it, it was offered to him by a very respectable man, and that he gave a great deal for it, &c. So, finding I could get nothing out of him, I bought her and took her home.

Strix gradually grew older and more infirm, until at last, one morning, on entering my library, I missed her from her old perch, and presently, to my great grief, found her by the fire-place, stretched out—dead! Few can imagine how much we felt the loss of our affectionate and faithful old friend.—*Cottager and Artizan.*

DEAR UNCLE MARK:—I would like so much to join your Horticultural Club. If I am not too young, will you please put my name down on your list. I am only seven years old but I go to school, and I love flowers very much. Mother has some nice plants in the windows. In the summer I have a little flower garden myself. I am afraid this is too long already. I hope all my Rural Cousins will read this, and if you ever come to Kansas, Uncle Mark, do come and see us.

From your little neice, GRACIE DILLE.

Johnson Co., Kansas.

[Thanks, Gracie, I will try to remember your invitation when I go to Kansas.—U. M.]

PERSONAL ITEMS.

The Princess Louise will sail for Canada on the 22d inst.

Senator Sharon, the Nevada absentee, has just drawn $3,000 back pay.

Senator David Davis is said to have lost fifty pounds since the death of his wife.

Maine is not represented in Congress at all now, From Blaine down the members are watching the Fusionists.

My wife and daughter was made healthy by the use of Hop Bitters and I recommend them to my people.—Methodist Clergyman.

AGRICULTURAL NEWS.

THERE is a report that the old United States Agricultural Society, inaugurated 28 years ago, but which has shown little or no vitality since the outbreak of the war, is about to be revived—Is it to be a rival of the three A's? . . The American Poultry Association held its annual session at Indianapolis on the 12th. Cash on hand $522.36, besides a wealth of standards, show-cards, etc.—a good showing compared with that of the first meeting a few years ago, when money had to be borrowed to meet expenses. . . According to the report of the Montreal Corn Exchange on the 15th the receipts of grain for 1879 amounted to over 23,000,000 bushels, which is larger than on any previous year. Shipments, 22,700,000 bushels. . . North Carolina has 52 cotton mills. . . In Powhatan Co., Va., during the last month a Mr. Watkins had 100 sheep killed by dogs. . . The fence law of S. C., is said to be a wonderful saving to farmers. . . . The fall clip of wool in Nueces county, Texas, amounted to three million pounds—more sheep there than in any other county in the State. . . . Hurrah grass is taking possession of a great many fine farms on the Arkansas River bottom. On account of its persistency, it is called "eternity weed." Negroes think its seed is sown by the devil.—So says the Little Rock Gazette. . . Nicaragua wheat is getting to be a favorite in some parts of Texas. It is claimed to be rust and smut-proof; to give double the yield of ordinary varieties; to be excellent food for mules, horse and hogs, ground. It makes sweet but coarse flour, and is said to be peculiarly adapted to the South. Millers, however, object to grind it on account of its hardness, and workmen to bind is on account of its bristly ears. Special milling steam attachments, it is said, are being prepared for it, self-binders will not shrink from the rough beard. Planted, in Texas, from August to March—Feb. and March preferably. . . One firm at Tully, N. Y., thrashed the following amount of grain this season:—Of wheat, 10,671 bushels at 4c. per bushel; 22,000 bushels oats at 2c.; 4,359 bushels barley at 3c.; 475 bushels buckwheat at 4c.; 1,152 bushels oats and peas at 3c.; 722 bushels flaxseed at 12c.; 302 bushels clover at 75c. per bushel, making an aggregate of 36,621 bushels of grain, and the gross proceeds amounting to $1,368,59. . . Last Monday additional storage capacity for grain to the amount of two million bushels was provided at Chicago; six hundred thousand bushels of wheat were on that day stored in ships, at seven cents per bushel, for transportation to Buffalo in spring. . . The apple crop of Chautauqua Co, N. Y., for 1879 is estimated to have been worth more than the butter production, and if the clear profits are taken into account, it is said to have been worth ten times more. . . Ex-Gov. Washburn, of Wis., has just given the Wis Industrial Association 40 acres of land at Montreal Point, his old home, to be used as a permanent fair ground. . . The stock of cheese in this city on January 1, is put down at 194,000 boxes. It is estimated that outside of the city there were in the State about 58,000 boxes. In addition to this, the States of Pennsylvania, Illinois, Iowa, Ohio and Wisconsin are estimated to have had 154,000 boxes. This made a grand total of 406,000 boxes on hand. A year before the amount of stock held in New York city alone was 396,467 boxes, and two years before it was 218,032 boxes. The amount this year, therefore, was considerably less than for two years past and made a more satisfactory showing as to future prices for this dairy prdoduct. G. J. Kruse, of Lake Village, Ark., claims to have a sow that gave birth to a litter of five fine pigs on Dec. 19th, and to another of 10 ditto, on Dec. 25th. . The striking Chicago packers were riotous last Tuesday. Non-Union men were mobbed and maltreated savagely, and several packing houses stoned. Police called out in force, mobs retire. Violence more *striking* on Wednesday. Mob becoming turbulent, and was swelled by the riff-raff of the city. . A destructive gale swept over Oregon on the 9th blowing down houses, killing cattle, blocking railroads, prostrating telegraph poles and "mussing up" things generally. . . A famine prevails in Russia in the country between the Volga and the Don, owing to the failure of the crops from drought. Some have died of starvation, many more dying; help from the government craved. . . An experiment is now being made in exporting live cattle from Australia to England. The cost of transportation is about one-and-a-half times the price of the beasts, which cost in Australia about double the price of Texas cattle in the Lone Star State. . . From Jan. 1st sheep may be landed in Ireland from this country, without quarantine and without being slaughtered at the place of landing. . . The nail manufacturers of this city have advanced the price of nails—bad for board fences.

There will be an Agricultural Institute at the Illinois University, Champaln, Ill., from Jan. 27 to 30. Twenty-two lectures will be delivered by prominent specialists. Boarding $1 per day; reduced railway fares; all cordially invited. . . The winter meeting of the Mich. State Pom. Soc. will be held at Hillsdale, Feb. 11, 12 and 13, opening with an afternoon session on first day. Other horticultural organizations invited to send delegates. All information will be supplied by Secretary Garfield, Grand Rapids, Mich.

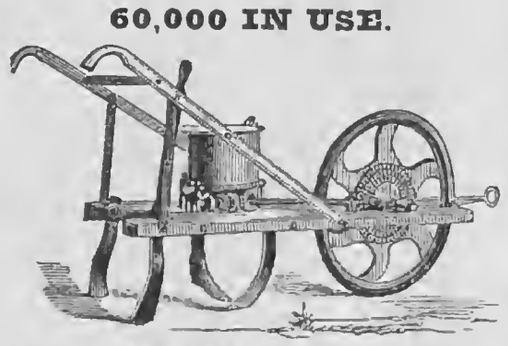
Implements and Machinery.

HOOSIER CORN DRILL!
60,000 IN USE.



Drops, with great regularity, one grain in a place, either 12, 15 or 20 inches apart, does the covering uniform in depth, and is both time and labor saving. A given area of corn planted with this machine contains as many plants as when hilled, but their arrangement is such that *each* plant has access to the *same* amount of plant-food that must necessarily be *divided* between from 3 to 5 plants when huddled together in a *hill*. Hence a healthy start and vigorous growth of the plants and the consequent production of large, well matured ears, by which the quality is improved, and the yield increased from 10 to 20 bushels per acre, over hill planting are natural results following the use of our **Corn Drill**. Send for circular.
HOOSIER DRILL CO., Richmond, Ind.

INGALL'S PAT. LINK AND CHAIN
Will make or mend your chains, of all sizes, without tools. Inquire at your Hardware store or address

Send for our FREE pamphlet. Address
AMERICAN DENTAPHONE CO., 232 Vine St., Cincinnati, Ohio

THE request often made by publishers that readers will mention their Journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the Journal mentioned and enables the advertiser to determine which Journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

Various.

BRIEFLETS.

"In our Senate Chamber there sits but one farmer, and he is a colored gentleman from Mississippi"—L. S. H. . . What is the difference in value between phosphates found in inorganic material as, for instance, South Carolina rock, and phosphates found in inorganic material like bone—who can tell? . . The French are such good cooks that they can make horse-flesh as palatable as we can beef

. There are thirty-two shops in Paris where horse-flesh is sold. . . New subscribers are requested to send for our Free Seed Distribution Supplement. This will explain to them many matters about which we cannot repeat detailed information. It will be sent without charge. . . Mr. Chcever says that cider for drinking purposes is a pest in any farmer's cellar, and that it is better for the well-being of all concerned to be satisfied with a barrel of "apples on tap." . . NURSERY GARDEN OPERATIONS.—Sow buttons everywhere—February is the month for cutting teeth—keep the cuttings—Trim your baby-sister's hair with the scissors. You may expect a fine crop—Dig the baby in the ribs; plant a blow on your little brother's nose and wait to see what the result will be. Probably some birch.—Punch. . . It is an excellent idea—that of breeding small cobs and big kernels. It is, however, well to bear in mind that the kernel must have something to stand and grow upon. The fact that the number of rows and the size of kernels necessitate a corresponding size of cobs is strangely overlooked by some corn breeders. . . M. Ludlow says, in the Poultry Bulletin, that the much-talked-of Langshan fowl is the original of the Black Cochin. . . The question is, why does not some one make a breed of *large*, non-sitters that can be kept within picket fences, as the Asiatics are?—Idem. . . Itch is a foul disease—who can blame hens for scratching? . . Are you saving your hen manure? . . Even as Nature benevolently guards the Rose with thorns, so does she endow woman with pins. . . One Hundred articles of value are offered in Our Premium List to those who raise clubs for the RURAL NEW-YORKER. It will be sent to all who apply. . . Peter Henderson charges for the coming year 60cts. per pound for *clean* seeds of Pearl Millet . . The price of the new striped Tea Rose "American Banner" for next season will be $3.00 each for largest—$1.50 each for smallest size. This is really *very* cheap when it is considered—as all the papers have been saying—that the *buds* are worth their weight in gold. The buds, however, don't weigh much. . . Those who can raise spring wheats we would recommend to try the variety known as White Spring Russian. Of all the kinds tried at the RURAL's farm two years since, this yielded as well as any. . . The Chinese Hulless Oats, now offered by every seedsman, are really an excellent kind. The kernels are plump and heavy. The only trouble is that they "shell out," if left until ripe. . . Those who are interested in seeds and plants should, from now on, review the advertising columns. . . It will soon be time to talk about Strawberries again, and also of small fruits in general. If there were any way by which we could oblige every one of our readers having 50 feet square or more of land, to cultivate the small fruits, we should do it. And in the end they would all thank us. . . If Congress will give Dr. Collyer ten acres of ground, he promises to return twenty tons of sorghum sugar the first season or forfeit his reputation. . . The brightest paper in America—THE RURAL NEW YORKER. That is what it is going to be for 1880. If not, we will forfeit *our* reputation! . . The manufacture of sugar from sorghum is a decided success with proper machinery and management. The Amber-Liberian cane is the most promising variety. . . A dog suspected of killing sheep should frequently have his teeth examined to see if any wool sticks between them, which, if found, is unimpeachable evidence that he is guilty, and he should be lynched at once without judge or jury. . .

Scientists May Differ

About the pathology of rheumatism, its origin and whether it be hereditary, but irrefragable testimony proves that when a tendency to it develops itself, Hostetter's Stomach Bitters is a reliable means of subduing that tendency. Some of the prescribed remedies for the disease are decidedly objectionable from the danger attending their use, others are utterly ineffectual, the best, the safest check is the Bitters. This very obstinate malady, the more effectually to overcome it, should be grappled with at the outset. Every one knows what terrible, what ceaseless pain it can inflict. Why then, should this atrocious, often fatal complaint be allowed to gain headway through indifference to its earliest symptoms, when a safe, long tested and strongly recommended medicine presents itself. In addition to suggesting this a means of relief it seems not inappropriate to caution the rheumatic against exposure.

INCLINATION YIELDS TO NECESSITY.

Young Lady:—Papa, are you going with us to the theatre?
Father:—No, children, I cannot; my only shirt is being washed.

The Literary Revolution and Universal Knowledge.

An Encylopædia in 20 vols., over 16,000 pages; 10 per cent. more matter than any Encylopædia ever before published in this country, and sold, handsomely and well bound in cloth for $10.00, in half morocco for $15.00, and printed on fine heavy paper, wide margins, bound in half Russia, gilt top, for $20 00—an enterprise so extraordinary that its success, beyond all precedent in book publishing, may be fairly claimed to inaugurate a *Literary Revolution.*

THE LIBRARY OF UNIVERSAL KNOWLEDGE is a reprint entire of the last (1879) Edinburgh edition of "Chambers's Encyclopædia," with about 40 per cent. of new matter added, upon topics of special interest to American readers, thus making it equal in character to any similar work, better than any other suited to the wants of the great majority of those who consult works of reference, and altogether the latest Encyclopædia in the field.

Specimen Volumes in either style will be sent for examination with privilege of return on receipt of proportionate price per volume.

Special Discounts to all early subscribers, and extra discounts to clubs. Full particulars with descriptive catalogue of many other standard works equally low in price, sent free. Mention this paper.

AGRICULTURAL ESTABLISHMENT.
Choice Garden, Farm, and Flower Seeds at Moderate Prices.
AGRICULTURISTS will rejoice to learn of the opening of a first-class Seed House, which affords them the opportunity of buying STRICTLY FRESH STOCK, thereby avoiding chances of loss and disappointment, arising from planting old seeds. Particular caution on the part of buyers is necessary this year, as there is an unusually heavy stock of last season's surplus on the market. We send samples of Staple Seeds free, so that farmers can test their growth before buying.
Catalogues (unillustrated,) Free to all.
A. D. COWAN & CO.,
The AMERICAN SEED WAREHOUSE
114 CHAMBERS ST., NEW YORK.

COOLEY CREAMER.
Awarded Gold Medal at Paris Agricultural Exhibition, 1879.

Butter made by this process, awarded Sweepstakes at International Dairy Fair, 1878, and Two Gold Medals and First Premium at same fair, 1879. First Premium at Royal Agricultural Exhibition, London, 1879.
It requires no milk-room.
It raises all of cream between milkings.
It affords better ventilation.
It requires less labor.
It is more thoroughly made.
It is cheaper,
and gives better satisfaction than any other way of setting milk.

Field Crops.

LEGUMINOUS FORAGE PLANTS. No. 1.

PROFESSOR W. J. BEAL.

To "live in clover" is one way of expressing happiness, ease, plenty, luxury, an abundance of good things. Cattle are well cared for, if they run in a pasture where the clover is knee-high or where it comes up to their eyes. The very word "clover," when spoken, has an agreeable sound.

The clovers and their allies belong to a very large and important natural order called Leguminosæ. This name is derived from "legume" which means a pod like that in which peas and beans are produced. The order includes about 6,500. These vary in size from small herbs to giant trees, and are found in all climates, cold, hot, wet and dry. The order is the most remarkable for its great variety of useful products. Lindley, in his "Vegetable Kingdom" says: — "It is not only among the most extensive that are known, but also one of the most important to man, whether we consider the beauty of the numerous species, which are among the gayest-colored and most graceful plants of every region, or their applicability to a thousand useful purposes." It includes numerous Acacias, noted for durable and fragrant wood, numerous gums, drugs, dyes, peas, beans, peanuts, licorice, fiber plants, perfumes and many forage plants, some of the most important of which are about to be described.

Trifolium pratense—Red Clover.

In saying anything of this well-known plant, I feel like attempting to introduce one neighbor to another where the acquaintance is intimate and has been of long standing. As a forage plant, I know of nothing which has been longer cultivated in England, having been grown as early as 1633 — nearly 250 years ago. It is our most valuable clover for meadow and pasture. The name Trifolium, is derived from two Latin words, meaning three leaves. Each leaf has three leaflets. Most red clover is biennial, though some plants, in isolated places are perennial. The roots may be made to live longest where they are kept cut down very little while they grow, and are not allowed to flower or go to seed. By selection and care several varieties (races) have been obtained, some of which are perennial, or said to be perennial, and are known in England as "cow-grass." In this country, it is usually sown with timothy (on sandy soils without timothy) on fields of young wheat, oats, or barley. It is mowed the next spring, pastured the year after, when it is usually turned under or perishes the winter after.

The clovers, especially red clover and other large clovers, are valuable for enriching the soil. They draw a larger proportion of their food from the air than is the case with true grasses. They are rich in nitrogen. The roots are large, run deep, and bring to the surface some of the most valuable mineral ingredients of the subsoil. I have not thought clover roots extended down very far, unless they were found at least six feet below the surface. They will often be found longer than this, even in soil which is somewhat tenacious.

To secure a good "catch" of clover, several things are important. The soil should be in good condition chemically and physically; rich, well drained, and well cultivated. When sowed in winter or very early in spring, the young plants are liable to be killed before they become well established. Some of our best farmers sow seed after the hard spring frosts are over. They then harrow or roll the ground or use both the harrow and the roller. These implements are usually beneficial to the young plants of wheat. For hay, clover should be cut at least as soon as it is well covered with flowers. There is much difference in the value of clover hay, depending on the mode of curing. This has been clearly shown by former articles in the RURAL.

The flowers of this species are in heads and usually red—rarely white. Each flower has ten stamens closely surrounding one pistil. The petals are irregular and somewhat resemble those of the Locust and pea. Bumblebees visit the flowers freely and have been thought by some to be necessary aids in carrying pollen to fertilize each flower. It is probable that they assist in securing fertilization, though I have found by experiments made during the past three years, that red clover will produce about two-thirds of a crop of seeds when the heads are closely tied in bags so as to keep all bees away. Honey bees do not usually visit red clover, as the flowers are so long hat they cannot reach the honey. There are some exceptions, though I have never seen honey bees numerous on this variety. Red clover is rather coarse for pasture. All kinds of stock will pass it over if they can get plenty of June grass which they much prefer. Especially is this the case in summer after the clover has sent up its flower stalks. The clovers are very sensitive and are favorably affected by a light dressing of gypsum or plaster. A second crop of red clover is often taken from the field, though this crop is usually allowed to go to seed.

Sutton & Sons of England, advertise

LEGUMINOUS PLANTS.—Fig. 28.

1. Trifolium pratense (common Red or Broad-leaved Clover); 2. Trifolium repens (Dutch Clover); 3. Trifolium incarnatum (Crimson Clover); 4. Trifolium hybridum (Alsike Clover); 5. Onobrychis sativa (Sainfoin); 6. Medicago lupulina (Black Medick); 7. Lupinus albus (Lupin, blue var.); 8. Vicia sativa (Vetch).

Trifolium pratense perenne—Perennial Red Clover, or Cow Grass.

They say "it is quite distinct from the common red clover, and is most valuable for purposes for which red clover is wholly unsuited. It produces only one crop in the year, and comes into cutting fully a fortnight or three weeks after the first cutting of red clover, at a time when green food is generally very scarce." They speak of it as valuable for permanent pastures. A small patch of this at the Michigan Agricultural College has lived for three years. It killed to some extent last winter.

I have also tried another clover from the same firm with just about the same result as last mentioned. Trifolium pratense hybridum giganteum Suttoni—Sutton's giant hybrid cow clover, is the imposing Latin and English name of this clover. They claim that it is a hybrid between the common red clover and cow-grass. "It is exceedingly productive, and under favorable circumstances, will produce three heavy crops for mowing or grazing in one year. It has also the merit of succeeding on soils that will not grow the common red clover." On our sandy land it does no better than our common red clover. A further consideration of this subject is reserved for future numbers

POTATOES WITHIN POTATOES.

This occasional phenomenon is thought by some to be caused by the perforation of the potato by young shoots, the tips then developing into tubers. Another view is that the bud is formed within the tuber; that it feeds on the parent and finally ruptures the skin by its increasing pressure. A Mr. Lachanme asserts, the Gardener's Chronicle, of London, says, that he can

Fig. 29.

produce this abnormal formation of tubers at will by persistently pinching out the sprouts. The rind of the potato finally bursts, revealing small, perfect tubers within. The internal development, according to this theory, was "provoked by the constant suppression of exterior growth" forcing the development of adventitious buds within. It does not appear that this abnormal growth can be turned to any practical account. The cut which we have reproduced, was drawn origiually for the Gardener's Chronicle of England.

Planting Corn on Sod Land.—A friend of the Rural, Mr. N. C. Jessop, of Long Island, who is noted for raising large crops of corn, pursues the following method of culture:—He invariably plants his corn on sod land. In plowing the ground he takes care to plow in a straight line. The land is marked crosswise, and the corn is planted at the intersection of these markings with every fourth furrow, dropping a little pulverized manure in each hill. No harrow is allowed on the land before the corn is planted. By this method the soil does not become so compact as if harrowed fine, and the sod will rot quicker. If the weeds should start before the corn, a light harrowing lengthwise will check their progress and not hurt the corn. He says he has followed this method for several years with signal success. At first his neighbors ridiculed it, but, somehow, they are now beginning to plant corn on sod land, and to use the harrow sparingly.

Farm Topics.

CULTIVATING WITHOUT PLOWING.

W. J. FOWLER.

Plowing land has always seemed to me an expensive and wasteful way of preparing it for seeding. All that the plow aims to do is to reverse the soil. If in addition it pulverizes the newly turned surface, the benefit is incidental and accomplished only by disproportionate labor. The Londoner said he never liked farming—the land was invariably wrong side up, and had to be turned over before anything could be done. With sod land intended for sowing or planting, this reversal of the soil is necessary. But fully two-thirds of the plowing done in this country is of stubble or after hoed crops, and for these, turning the surface soil to the bottom of a deep furrow is more often a detriment than a benefit. English farmers are using a scarifier, cutting up the stubble and pulverizing the soil to the depth of five, six or seven inches, but without turning it over. This does not cost as much labor as plowing; more surface can be prepared per day in as good or better condition, and from what I have heard of this process, I judge it is a success.

It seems to me that this surface-working stubble ground for wheat in the fall ought to succeed. When we plow, good farmers drag and roll the surface so as to make it hard and pack the under soil as thoroughly as before plowing. If the soil is properly enriched, it makes little difference to wheat how hard it is. Generally the harder the sub-soil, with only two or three inches at the surface moist and permeable, the safer the plant will be from winter-killing and the better the crop. The stubble of oats and barley is in the way of successful shallow culture. The plow, which will turn the stubble well under the furrow, seems to be indispensable. Yet the stubble itself is of little or no advantage to the wheat plant. If the field could be burned over before plowing, and then cultivated to the depth of three or four inches, it would be the best seed-bed possible. The ashes of the stubble mixed with the surface soil, would be worth more as manure than the stubble itself, decaying as slowly as it is apt to do.

Our severe Northern winters pulverize the surface soil to the depth of three or four inches, and especially after hoed crops there will be on the surface a fine vegetable mold which makes the best possible seed-bed for oats or barley. If the preceding crop has been kept clean of weeds, as it should be, it will be a great mistake to plow it. Dragging or cultivating the surface lightly, so as to level down ridges, is all that is required. If corn stubs or old potato vines are in the way, they should be gathered in heaps and burned. By this method a large amount of land may be prepared for seeding with little labor and in much better time than if done by the plow followed by the cultivator or harrow. For most kinds of spring grain, it seems to be well settled that shallow plowing is usually better than deep. On well cared for, clean and mellow potato stubble the after grain crop will be better if the plow is dispensed with altogether. The exceptions to this are where the soil is foul with thistles and other weeds which need to be checked by spring plowing, so as to give the grain an even start and better chance to keep down the weeds.

THE TIME TO SELL PRODUCE.

One of the most perplexing questions with which the farmer has to deal is when to sell his farm produce, so as to realize the highest possible price for it. It is straight-forward work to raise a crop and prepare it for market; but to decide upon the exact time to sell it and the price it should bring, is quite another thing. Almost any product of the farm will bring more at some part of the year than at any other; but that time varies in different years, and it is not always easy to foretell when that time will come or to recognize it on its arrival. If a farmer harvests a crop, he feels that he should receive the highest market price for it, and so when he has prepared it for market, he is sometimes undecided whether to sell it at once or hold it in hopes of a rise in the price. It is impossible to give any rule by which a person can decide the time to sell any crop to the best advantage. Some farmers are in the habit of keeping their produce too long, and are thereby sometimes heavy losers. A case of this kind came under my notice, of a farmer who once received the enormous price of $2 50 for a large crop of wheat. He was thought by his neighbors to have been very fortunate; but it proved the reverse, for since then he has not been willing to sell any crop of grain at a fair, remunerative price, but always "hangs on" for more, sometimes for years and almost always with loss.

Here is one of the greatest advantages that a farmer may receive from reading agricultural papers. The market reports and especially the "Everywhere" department of the Rural, are of great use to those who know how to utilize them. From them we learn the state of the markets in the principal centers, and the progress and prospects of all the principal farm crops in different parts of the country, by which we may judge whether there is likely to be a scarcity or a surplus in any product we may have to sell. If we find, from these reports, that in a great many parts of the country a certain crop is unusually poor, it is reasonable to judge that the demand for that product will improve, or if for any reason there is a light crop of some certain product in some foreign country, thus causing a great foreign demand, we can also hope, with reason, for higher prices for that particular article.

But there are other things to be considered besides a probable rise in price, in holding farm produce. In all the products of the farm, there is, of necessity, a constant waste. Loss of weight from shrinkage, damage from rats and mice, insurance and interest on the money that it would bring, should all be taken into account. Doubtless the best time to sell produce, in the long run, is as soon after it is ready for market as we can receive a fair, remunerative price for it, unless for some good reason there is a reasonable prospect of a better market in the future. G. A. Gore, Jr.

FURNISH YOUR BOYS WITH TOOLS.

Prof. John E. Sweet, in an address before the Onondaga Co. Farmers' Club, said: "The farmer who provides himself with the necessary tools to do the repairing of the farm, not only makes a paying investment, but does for his sons, in another way, just exactly what he does for them when he sends them to school. He gives them a chance to learn something; he does even more—he gives them a chance to learn to *do* something. From among those boys will be found the mechanical engineers of the future."

It would be difficult to crowd more truth and common sense into this short space. It is well known among mechanics that when an apprentice "learns to handle his tools," his trade is half learned. No man can even saw off a fence-board as it should be done without considerable practice. He must first learn to handle his saw. Not half of mankind—to say nothing of womankind—can drive a nail without either splitting the article nailed or pounding their fingers, and perhaps they will do both. Not one man in twenty can shove a jack-plane with any reasonable hopes of success, and the like awkwardness extends to the use of all manner of tools. If farmers will furnish their boys with tools, and teach them how to keep them in order, the next generation will not be so helpless when anything is broken, as is the present one. With a few dollars invested in tools, many journeys to town may be avoided. Moreover, by the use of tools one may learn something of mechanics, and is a much better judge when called upon to select any farm machinery or tools.

I remember an instance, when a boy, of a neighbor who had a small workshop, with an assortment of tools, which his boys were allowed to use, and the consequence was, his five boys, every one of them, became in time first-class mechanics, and some of their useful inventions have been described and illustrated in the Rural. Other boys in the same neighborhood, apparently equally intelligent, almost without an exception, grew up to be bunglers, some of them without sufficient skill to sharpen a sled-stake. N. R.

Arboricultural.

PLANTING HIGHWAY SHADE TREES.

FORREST K. MORELAND.

That portion of the highway laws of this State which has particular reference to the planting of shade trees is well calculated to accomplish the desired end. The law is contained in Chap. 566 of the laws of 1870, and is substantially as follows:

Any inhabitant liable to highway tax, who shall transplant by the side of the road any forest shade trees or fruit trees, of suitable size, shall be allowed by the overseers of highways, in abatement of his highway tax, one dollar for every four trees set out; but no row of Elms shall be planted nearer than seventy feet, no row of Maples or other forest trees nearer than fifty feet apart, except Locusts which may be set thirty feet apart, and no allowance, as before mentioned, shall be made, unless such trees shall have been set out the year previous to the demand for such abatement of tax, and are living and well protected from animals at the time of such demand. No person shall be allowed in abatement of his highway taxes, as aforesaid, more than one quarter of his annual highway tax, and no one shall receive any abatement of tax for trees planted previous to the passage of the act. This is substantially the law as affecting the reduction of highway taxes by setting out shade trees. There is also a statute protecting farmers who may set out trees in the highway opposite their lands, provided the trees are not set closer than six feet apart. In this latter case the farmer owns the trees and may use them for his own profit and may protect his rights as against all others.

It is my opinion that those who take advantage of the statute allowing an abatement of a portion of the highway tax, after receiving this abatement, lose the right to convert such trees to private use afterwards. For illustration: A, in the spring of 1879 planted a dozen shade trees on the road-side. In the spring of 1880, all of the trees being alive, he receives his abatement from high-way tax to the amount of three dollars. He has virtually sold these trees to the public, and when they become valuable for timber or fuel, he has no right to cut them and apply them to his own use. Not that the public own the trees, but trees transplanted under these conditions become like the soil of highways—the property is in the adjoining owner, but the public has an easement that the individual cannot interfere with or control.

The compensation for setting out shade trees is sufficiently liberal, so that there ought not to be any highways unprovided with such trees. There are few farms so situated that good wages cannot be made at setting trees at twenty-five cents each. It is only necessary to set sufficient trees each year to cover one fourth of the highway tax for the next year. An interesting question might arise when a farmer having complied with the statute and having received his abatement, should afterwards take advantage of his right to set out as many trees as he wished not nearer than six feet apart. He would own the trees not set out under and in compliance with the statute, free of any claim or interest the public might have. I think the statute a very good one and one that aims at important results, but in no part of the State with which I am familiar, has it awakened much interest among farmers. I should like to see the experiment tried of fixing the value of the trees at a higher price, or, if that should not be deemed advisable, to allow them to be planted closer, and allow a larger portion of the highway tax to be commuted in a single year. The law is a good one, but it does not seem to reach the average mind, and it certainly has not been productive of the good that our legislators strove to accomplish.

St. Lawrence Co., N. Y.

The Sunray Pine.

I have had the Pinus Massoniana in cultivation for ten years. During this time it has proved perfectly hardy, and very easy of propagation. Five years ago I grafted several young Scotch Pines with clons of this tree; nearly every clon grew and one small tree is bearing cones, though none have appeared on my oldest tree. This Japan Pine is not only very hardy, but it is very beautiful, having the soft, slender leaves of our White Pine arranged after the manner of the Scotch Pine—two leaves in a sheath, and densely clustered on the ends of the branches, spreading in every direction, hence the common name of Sunray Pine.

Hardin Co., Ohio. W. C. Hampton.

[The Rural New-Yorker had the honor of conferring the name of "Sunray Pine" upon the Golden Variegated Pinus Massoniana. The species had never, that we know of, been called "Sunray Pine," for the reason stated by our friend or for any other reason, before we so named it.—Eds.]

That Florida Coffee Tree.—I see by an editorial note in the Rural of Dec. 13th, 1879, that some of the public press doubt the truth of the maturing of the coffee-berry in south Florida. During the past week I had the pleasure of inspecting a limb taken from a Coffee Tree belonging to Mrs. Joe Atzboth, of the County of Manatee, Florida—the lady alluded to in the article. On it were berries of three different ages, some fully ripe, some green and growing, some young berries and blooms. No, sir; it was not the product of the hot-house in Washington City, but the product of a four-year-old plant, grown in the open air on the banks of Manatee River, at Braidentown. None of the trees has been injured by cold yet. Doubt no more!

Tampa, Fla. T. F. Hampton.

Pomological.

TRAPPING THE CODLING MOTH.

M. B. BATEHAM.

Professors Cook and Beal deserve much credit for their persistent labors in teaching the people of Michigan how to trap that worst of insect pests, the codling moth, by what is called the band method; and it appears by the reports that quite a number of the orchardists of that State are practicing this method of saving their apple crops from worms, with considerable success. Professor Cook has also favored us in Ohio with his presence and instructions on this topic at several of our meetings within the past five years, but, as far as I have learned, not a single orchardist in this State has adopted this method, excepting on a few trees by way of experiment, or in small orchards where sheep or hogs could not be kept. Mention was made of this fact in my report of the late meeting of our State Horticultural Society published in the Rural of Jan. 3. Prof. Beal, alluding to that report, in a recent letter to me, says:

"I see that you again state that most of the speakers at your meeting, in discussing the codling moth, say the band method of trapping is too laborious or troublesome for large orchards. Here we change the bands nine times during a season; the labor costs only $1.08 per 100 trees, and the material for the bands about one cent a tree—in all a trifle over two cents a tree per year. Not such a dreadful expense or bother to us!"

I heartily congratulate Prof. Beal and the orchardists of Michigan on the discovery of such a cheap mode of managing this method of trapping codling moths, and I hope it may prove as effective as it is cheap; then it will certainly be the fault of the growers if the apples of that State are not hereafter free from worms. I hope also that Prof. Beal will tell us just how it is done; for I know he is not a believer in horticultural patents or monopolies. I have fears, however, that his cheap method will not be of much advantage to us in Ohio. For so little expense to be possible, I apprehend the trees must be young, with smooth bark and low heads, so that only one band has to be used, and no rough bark to be removed, and the bands were doubtless of cheap paper, and the work done by college boys or other cheap hands. In the Michigan Pomological Report for 1878, Prof. Beal states that he found the expense of the bands and labor for 250 trees, amounted to about four cents a tree. The size of the trees is not stated, nor whether one band or two were used. I presume it was the

same orchard as in the experiment above mentioned.

Prof. Cook and others have told us heretofore that cloth is the best material for the bands, and it is necessary to apply two bands to each tree, because it has been ascertained that about as many of the worms crawl down from the fruit on the limbs as crawl up from that fallen on the ground, to seek places of shelter beneath the scaly bark on the trunks; hence one band needs to be near the ground and another near the branches and of course all the rough bark must be removed from above and below the bands. In fact, Prof. Cook advises cleaning the whole tree of rough bark and washing with soft soap. Now, to say nothing of this latter process, it is quite obvious that the rest of the plan, including nine or ten removals and replacings of the bandages, is more laborious and expensive than represented by Prof. Beal, unless the trees are young and smooth.

The reasons why our Ohio orchardists are not generally willing to try this method, are: 1, the majority of the orchards in this State are older than those of Michigan, and the trees much larger, ranging from four to six feet in circumference where the bands should be applied, and covered with rough bark—not only the trunks but the limbs for 12 to 20 feet in hight—and to be at the trouble or expense of cleaning these of all the scales that can afford protection to the worms is simply out of the question—our farmers won't do it! And, 2, most of our apple growers are farmers who find it profitable to keep sheep and hogs, and, of course, raise corn or other grain to feed them when necessary, so that the services of these animals as worm destroyers in the orchard cost less, besides being more effective, than the band method in its application to large trees.

Death to the Currant Worm.

I mean the pale green worm from half to five-eights of an inch long with a black head; but why it should be called by the above name, I never could understand; for I never knew it to touch the Currants as long as there were Gooseberries near. After submitting to the destruction of my large English Gooseberries for two or three years, I looked up the biography of this insect, and finding that it hibernated in the ground under the bush, I applied in the spring a plaster of lime-mortar around the base of the bush over a circle of 18 to 24 inches in diameter. That season I saw only one of the pests, and none for years after. Mildew, however, set in strong, but my experience leads me to believe that sulphur, if faithfully applied, will most certainly prevent and even stop that; but it is safest to use it as a preventive. S. B. P.

Dairy Husbandry.

MILK-PRODUCERS' PROTECTIVE ASSOCIATION.

According to the agreement noticed here two weeks ago, more than 200 delegates representing the farmers of Orange and Sullivan counties, N. Y., and Sussex county, N. J., assembled at Middletown, N. Y, on Tuesday, Jan. 20, to organize a Protective Association. Fully 100 other farmers, not delegates, were also present. The following plan of organization prepared by the committee appointed on Jan. 6th, was almost unanimously adopted:

We, the milk producers along the lines of the Erie, Midland, and Sussex railroads and their branches, in order to protect our interests in the production and sale of milk and cream in New York city and vicinity, so long neglected as to leave them upon the verge of ruin, do hereby form ourselves into an association which shall be known as the Orange, Sussex, and Sullivan Milk Producers' Association.

That this association shall consist of two classes of organizations as follows:

A local organization of the milk producers at each milk station where there are 100 or more cows represented, to be known as a Station Association.

A controlling organization to be known as the Central Association, consisting of general directors, appointed by delegates from the different Station Associations along the lines of their respective railroads.

The Station Association shall be organized with the following officers, viz.: President, Vice-President, Secretary, Treasurer, who shall be under proper and sufficient bonds, and a Director. If at any milk station there be less than 100 cows represented by those wishing to form an organization, they may unite with other station associations.

Any milk producer may become a member of this association upon paying to the treasurer of the association of which he is to become a member the sum of $5 each for the average number of cans of milk shipped by him daily, and subscribing his name to the by-laws of the Station Association, which shall contain the following agreement or pledge:

"I, the undersigned, a milk producer of——Station, —— County, —— State, do hereby agree and pledge myself to place the milk and cream production of my dairy or dairies in the hands or under the control of the Executive Committee of the General Association to be disposed of for my best interest and for the best interest of all the members of this association.

"I do further agree to stand by and support this agreement in every particular, under the penalty of forfeiting, as liquidated damages, my membership fee heretofore paid by me to the Treasurer of this Station Association."

This plan of organization shall not go into operation unless two-eighths of the farmers shipping milk over the different roads represented shall subscribe to it.

This plan differs but little from the system successfully practiced for many years in the neighborhood of Philadelphia. It was also resolved to hold a mass meeting of the farmers of the three counties at the same place on Thursday the 29th inst., for the purpose of effecting a permanent organization.

Lewis Horton, of Golden Bridge, and J. D. Powell of Katonah, Westchester County, were present as a committee from the Harlem Railroad. They stated that producers shipping over that road were organizing for self-protection. They propose having an Executive Committee to transact business in the city for all producers on the Harlem Railroad, and would be glad to join with similar committees representing the Erie and Midland Roads. Committees of milk-dealers were also present, representing the Kings County and New York Milk Exchanges. N. B. Kilmer, a Brooklyn dealer, said the principal obstacle in the way of farmers getting a better price for their milk was the presence in the market of cheap milk, sent from the country or produced in the city, in the hands of irresponsible dealers, who undersold the regular trade. He read the draft of a bill which the dealers of New York and Brooklyn propose asking the Legislature to pass, providing for licensing every dealer by the Board of Health, and for a rigid inspection of milk at every point of shipping, as well as at the terminal stations; also prohibiting the use of brewers' and distillers' grains for feeding cows whose milk is offered for sale in the cities of New York and Brooklyn, the expense of the inspection to be paid from the funds derived from license fees. Only one farmer opposed the bill, which was approved by the meeting unanimously. George W. Allison, of the Orange County Milk Association of New York city, spoke of the immense number of cows in and about the city that were fed on distillers' slops, and said it was this poor milk which made the surplus, ruined the business of the legitimate dealers, and made them unable to pay more to the farmer. He hoped the farmers would not undertake to force a big price from the dealers, for if they did the dealers would get their milk from some other sources.

Threats of this nature were also made by several other milk-dealers and there seemed to be a good deal of acrimonious feelings between the milk producers and dealers. Doubtless the spirits of the latter were somewhat embittered by having been refused admittance to the meeting until after its legitimate business had been concluded. It is intended to have the organization ready to assume control of the milk of its members by April 1. It is not the purpose of the persons engaged in this organization to demand exorbitant prices for milk, but to secure remunerative prices at all times, and to regulate the supply to suit the demand, with a view to sustaining the price, and still keeping their product in the market.

A NEW DEPARTURE.

At the big dairy fair held in this city last month were exhibited cans for handling milk after a style that is not only entirely new, but looks to me to possess some of the elements of unfathomable possibilities. This, perhaps, is asking for a good deal, and yet we have all lived to see Orange County superseded by Iowa, while our professors were telling us at all the Dairymen's Conventions that good butter could not be made outside of a certain territory or belt circumscribed by the professors' own individual experiences. By the way, what has become of that "dairy belt" we used to hear so much about?

The item of interest I wished to call attention to was a set of tin pails about eighteen inches high, twelve across the top and eight at the bottom. In the side of these pails was inserted a pane of glass with, if my memory serves me rightly, a per-centum scale marked by its side. These pails are distributed among the dairymen with instructions to fill them with fresh milk from the cow, and set them immediately in cold water. At a given time twice a day this milk must be skimmed, and the owner of the pails calls for the cream.

It is a well settled principle in butter-making that cream fresh from the milk will not churn profitably; that is, a large per-centage of the butter will not come out of it unless the cream has had several hours to ripen before it reaches the churn.

It matters not whether the cream be sweet or sour when put into the churn, it must have this time to take on some chemical change, I suppose, before it will give up all the butter. Now the question is, what ought to be done with the cream during this time of rest? The aforesaid parties purpose to utilize it by hurrying it on to the market; that is to say, cream raised, say 200 miles (and if refrigerating means were employed the distance could be stretched to a thousand), from New York city, immediately when collected, is shipped to the city and there manufactured into fresh butter every morning.

Let us go a step farther: Suppose the centrifugal machine, through Yankee ingenuity, becomes simplified and cheapened until one can be found in every farmer's house; then the farmer draws the milk from his cows, puts it in the machine, and in twenty minutes he grinds out all the cream, hermetically seals it and ships it direct to the factory in New York city. By next morning the denizen of the big city, having forgotten all about the corner grocery, orders directly from the factory, a few blocks away, his regular morning's supply of fresh butter and real, genuine butter-milk—no churned clabber for him.

These are days of surprises, and it is dangerous to doubt the possibilities of our enterprising dairymen after they once get out of the leading-strings of their old grandmothers' ways of doing things. As an earnest of the practicability of this plan, I found a sample of cream at the fair put up in neat bottles and all the way from Iowa. The cream claimed to be some two weeks old. I took a bottle of it home and tried it in coffee, and on sweet preserves. There was not the slightest semblance of sourness about it; but, on the contrary, it was as sweet and delicious as any cream could be. How it was preserved I know not, except that it was hermetically sealed; but it certainly could travel across the ocean, if necessary, with impunity. If the process of preserving it is cheap, it may help to solve the above problem. L. S. Hardin.

Sheep Husbandry.

THE ORIGIN OF LINCOLN SHEEP.

I notice my name in connection with a dispute as to the "Origin of Lincoln Sheep," in the Rural for December 27, and with your permission will endeavor to set the parties right. Now, if we try to ascertain the "origin," we shall have to go back to the Dark Ages of sheep-breeding; for we read in an ancient history of the county that "The Lowlanders came to Lincoln for the fine wools of the sixteenth and seventeenth centuries, when the tide of the Witham rolled at the foot of Lincoln Castle walls, and barges came to load for the Low Countries, and even at that time the long wool of "Ye towne of Lincoln and ye comntrie about" was greatly esteemed.

But I suppose what your correspondents are after is to ascertain to what breed or breeds the Lincolns of the present day are indebted for their wonderful development of both wool and mutton. They were originally celebrated as producers of the very finest quality, as well as the heaviest fleeces of combing wool, but at the same time they were large, coarse, slow-growing sheep. I believe there can be but little doubt that the Leicester has been used to make them mature sooner and take on flesh quicker while young, though many of the best ram breeders deny such to be the case. They claim that it has been done entirely by selection, and pertinently ask if Bakewell could *manufacture* the Leicester from sheep similar to theirs (Leicestershire and Lincolnshire being adjoining counties), why not the Lincoln breeders improve theirs also by selection? The point now is not worth disputing, for in my opinion there is not a long-wool sheep of any breed in England worth owning, that has not some Leicester blood in its make-up. But let us rather give credit to those breeders who had the sagacity to use the cross in such a manner as to retain all the good qualities of the old Lincolns, and only absorb such as were desirable for their purpose from the Leicester. That there have been any "dashes" of late years is not probable, because the Leicester can add nothing that the Lincoln requires. What was done in that direction was about 90 years ago, for we find that four Lincolnshire farmers paid Mr. Bakewell 1,000 guineas ($5,000) for the *use* of *one* ram *one season*.

That the Lincolns are indebted in any way to the Cotswolds is not a fact. The cross has been tried, but invariably with bad results. I know a once prominent ram breeder who tried the cross, and in two years he lost all his customers, and had to go out of the business. They are pre-eminently the sheep for the district in which they are raised, growing heavy fleeces of the finest lustre wool, producing the heaviest carcasses of mutton, and being so hardy that they can "winter out" on turnips, perhaps up to their knees in mud for weeks together during a rainy season, and not only live through it, but grow and do well.

G. G. says there are only two cases of Lincolns reaching 400 pounds. I could give many more. At the Smithfield Cattle Show they almost invariably carry off the honors as the heaviest sheep exhibited. Again this year, as usual, many ewes have been exhibited there weighing 350 lbs. each and upwards. "Dashes of Blood" will be considered in next.

The Poultry Yard.

A PROFITABLE POULTRY ACCOUNT AND ITS LESSONS.

NELSON RITTER.

Having kept an accurate account of the receipts and expenses of my hens for the last 13 years, it may interest readers of the Rural if the results are given:

Amount received for chickens and eggs sold in 13 years		$2,624.46
Amount paid for feed in 13 yrs	$1,446.98	
" " " fancy fowls and eggs	54.22	
" " " additions and repairs to hen-house	87.94	1,589.14
Leaving as net profit		$1,035.32

or a profit of about 65 per cent. The number of hens kept ranged from 50 to 280. The best results were obtained when 150 were kept. I am well aware that this report falls below many highly-colored ones that we read of in the papers; but it has the merit of being a truthful one. All poultry and eggs were sold at market rates, none having been sold at fancy prices, so that this profit is a legitimate one, and can be realized by any person using common sense in the management of his hens. The highest profit in any one year was $203 38, in 1870; the lowest $26 25, in 1875. In the years 1869, 1870, 1871, 1872, the profit was $633.12, leaving $402.20 for the other nine years. This difference was partly owing to the change in price of eggs and chickens, and partly to a change in the breed of my fowls. It will be seen that each dollar paid out in the 13 years, has given a return of $1.65, often within the week, certainly as often as once per month upon an average.

In looking back over these years I discover many mistakes made that lessened the profits. They certainly can be avoided hereafter; but, whether others equally detrimental will not be made, is not so certain. The worst mistake was my catching the "fancy-hen fever," and paying exorbitant prices for new breeds that looked well, but were in all other respects undesirable. Hens, bred only for color, purity of plumage, exactness of comb, etc., will not lay well—at least that has been my experience. The person who has a fancy for perfect fowls, and has the means to gratify that fancy, has certainly a perfect right to do so, just as he keeps other pets; but for the man of moderate means, who is obliged to keep fowls for profit, a "business hen" is best. After paying $4 per dozen for eggs, and raising chickens that would not lay well, and becoming disgusted with this result, I watched our markets until I discovered a man who brought in plenty of eggs in the winter months. His eggs were bought without any questions as to breed, and set with satisfactory results. This is a good way for new beginners to procure a stock of laying hens, afterwards selecting eggs from the best layers for setting, and thus improving in that direction.

Let me add that when one's hens are doing well, he should not change them at the solicitation of persons having something better to

sell, nor be misled by glowing advertisements of some wonderful new breeds. Give the fowls you have the care and attention you would the new kinds, and you will find less difference in breeds for profitableness than most people suppose. If you desire to give new breeds a trial, "go slow," cling to what you have until the newer ones prove to be more desirable, even if you are called "old fogy" for so doing.

Onondaga Co., N. Y.

PRESERVING EGGS.—Several years ago I came across an article in some paper, stating that a factory had just been started at Passau, Bavaria, for this purpose. The eggs were first dried, then ground to a fine meal, and this put up in tin cans for use, the same as we do with fruits and vegetables. If this method of preserving eggs proved successful in Bavaria, it would be well worthy of adoption in America, especially in the Western and Southern States, where eggs are so cheap and it is so difficult to find fair sale for them. Thus prepared, an almost unlimited market may be insured for all our surplus, and a high price. Not long since, I saw a statement in an English paper, that the rounding number of 870,000,000 eggs had been imported from France into Great Britain the preceding year, valued at £2,650,000—say about $13,000,000 of our money. I do not know how true the above statement is, but if it states a fact, the United States ought and might, if we take the proper means to do so, profitably share in this importation.

A. B. A.

PEKIN DUCKS.—Take it all in all, I do not consider the above-named ducks as profitable as the smaller breeds. A near neighbor keeps them, so I have had a good chance to watch them, and also to make some inquiries in regard to them, and with the same care that the smaller breed of ducks receive, they scarcely give any profit, while the others do well. The Pekin ducks are beautiful water-fowls, but I do not believe they are profitable to keep, except as fancy fowls, and if anyone who does not breed them for sale at fancy prices has found them otherwise, I should be pleased to hear from him through the RURAL.

The Swine-Herd.

YORKSHIRES.

The Different Families, their Origin and Characteristics.

COL. F. D. CURTIS.

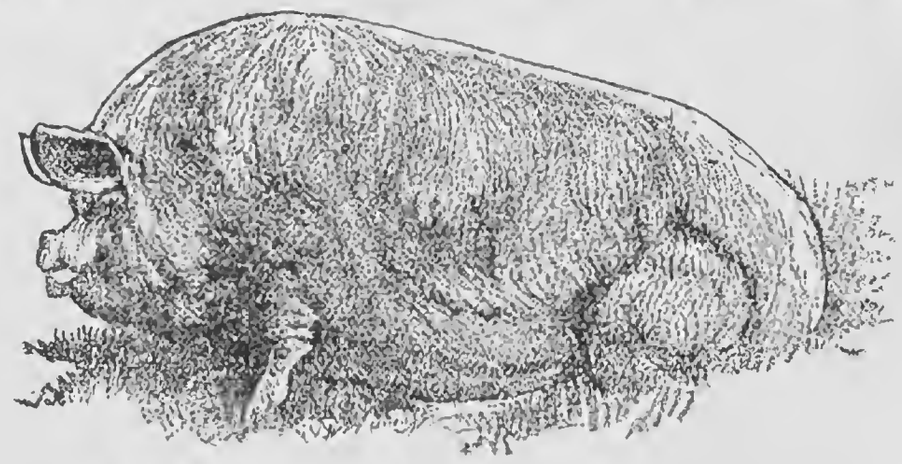
AMONG the breeds of white hogs the Yorkshire, as a pure breed, seems to antedate all others in England. The original Yorkshire hogs were undoubtedly the native breed of England and were of the same blood as those bred in other counties, with the differences which liberal or scanty feeding always make—and carefulness in selection and breeding. The Yorkshire farmers seem to have been impressed early in the present century with the importance of improved pigs, and of careful breeding, in order to obtain them. It is probable that they first used white Chinese pigs to cross upon the native. The effect of crossing these chunky and thick-fleshed pigs upon the long-bodied and coarse natives, would be to shorten the bodies, round the hams, widen the shoulders and make the cheeks plumper, as well as to shorten the noses.

These characteristics are developed to a marked degree by these ancient pigs. Mr. Harris, in his work on the pig, quoting British authority, says "the first improvement of the old native Yorkshires was made by crossing them with the white Leicester." He does not tell us how the Leicester pigs originated, but they probably trace back to a direct Chinese cross, as this was the only breed of pigs in those days, which could make the changes which were the basis of the improved hogs.

A variety of families of these improved white pigs seems to have been started in different parts of the kingdom, very similar, if not almost identical, in points and appearance. At first, the large pigs seem to have taken the lead, which was natural, as the original hogs were coarse and slow to mature, often reaching an excessive weight. Subsequently, a finer and smaller family was established, called the Small Yorkshires, which could have been done by constantly selecting the chunky and finer-bodied pigs or by direct and positive crosses with the Chinese. A middle breed was established, later, which is the best, as it is neither large nor small, and possesses all of the desirable qualities of both.

The Yorkshires are thick-meated and easy to keep. They are more objectionable than some other breeds on account of the large amount of fat in proportion to the lean, and on this account are not suited for bacon, and the hams require close trimming or there will be a considerable waste of fat. Their clear white color, and thin, delicate skins make them an attractive breed, while the fine grain of their flesh makes it very palatable. The American market does not now demand the thick, heavy pork which used to be so popular, but a thinner and leaner sort. On this account, the Yorkshire pigs and their crosses will not be so much bred, notwithstanding their early maturity and remarkable aptitude to fatten. The same criticism will apply to all similar breeds.

In England the name, Yorkshire, has been supplemented by a number of others, and these the names of different families, as York-Cumberland, Cumberland, and Lancashire, another name for Manchester; quite recently the general and more appropriate name, Small White breed, has been substituted for the various titles given to the smaller white sorts,



MR. SPENCER'S PRIZE SOW, "SISTER TO OMEGA."—FIG. 30.

which are now bred as much in other counties as in Yorkshire or in Cumberland, if not more. There is but little waste in these pigs, as the following standard of characteristics indicates.

The principal points are:—"A short, upturned nose; lower jaws dished; prick ears, slightly inclined forwards; heavy jowls; the neck somewhat long and well padded with flesh, making the head appear to be hung at a lower level than the shoulders, which should be wide apart and well joined to hoop-like ribs; the loin wide; the hind-quarters long and square, with meat down to the hocks; the tail thin and set high; the legs short and placed well apart, the whole being covered with a coat of fine hair." This is the English standard, as taken from the London Live Stock Journal of recent date.

While a good coat of hair is the standard, many of these pigs "run back" to the old Chinese type, and have bodies nearly naked, or with thin and scattered coats. This is one of the objections to them, as in summer they are liable to blister when exposed to the hot sun, and to get scabby in winter on account of the cold. It is a singular fact that these white hogs, when crossed upon either Essex or Berkshire, will almost invariably produce pigs with dark spots on the skin, the hair being entirely white; but these pigs bred together will become spotted or mixed in color.

The large Yorkshires are not numerous in America. A few years ago fine specimens were exhibited at the State fairs by James Brodie & Son, of Jefferson Co., N. Y. These were the only ones which had the appearance of being well-bred, that we have seen for a number of years. The smaller families are bred quite extensively, and usually fill a number of pens at the fairs, ranking in numbers and size about the same as the Berkshires, but more admired by many on account of their color.

The Yorkshire pigs, like all other thoroughbreds, will improve any kind of native hogs, when crossed upon them, by producing more aptitude to fatten and also smaller bone, with less offal, and thereby an increased value. Such crosses will mature earlier and make more pork, on the same amount of feed, than the natives.

IN connection with the above article on Yorkshire Swine, we give herewith an engraving of a celebrated English prize-winner of that breed, Mr. Spencer's sow, "Sister to Omega." Redrawn from the Ag'l Gazette.

HOG CHOLERA.

THE appearance of hog cholera in this neighborhood within the last month reminds me of the efforts the Government has made to investigate the nature, causes and treatment of this malady. I have wondered if all over the Union there is as much ignorance and lack of interest about these investigations as among the farmers of this section. Here in Illinois every sick hog is supposed to have the cholera. Thousands of hogs are yearly lost owing to this popular error. My own experience is an illustration of this. For three years during February, March and April, I lost several pigs from four to six months old by a disease my neighbors and myself supposed to be cholera. When one thinks this plague is destroying his hogs there are a folding of the hands and a feeling of helplessness that lead one to think the trouble of investigation useless and to make no effort to avert the calamity; whereas by such an effort, all, or at least a part of the infected animals might be saved. When once my doubts were aroused as to the nature of the malady attacking my hogs, a little investigation soon proved that it was not cholera. Having ascertained the real nature of the disease, when the pigs began to ail I was able to treat them so as to save them all. Just in the same way thousands of hogs that might easily be saved, are yearly lost through ignorance and misconception.

Another fruitful source of loss lies in the belief of many in remedies for hog cholera. The venders of these, though generally frauds who knowingly impose on the credulity of their dupes, are occasionally themselves deceived. A few of them may have succeeded in curing their hogs with the nostrums, from what they supposed to be cholera, but which in reality was some other ailment. Then the greed for making money out of their discovery has confirmed their belief in its efficacy, or silenced any doubts raised by its failure in hundreds of other cases. The majority of those who sell such recipes or nostrums, however, are arrant swindlers with no real faith in their own medicaments, but an unbounded belief in the gullibility of the rural population—a belief which their success year after year shows to have some foundation. Farmers trusting in such worthless "cures," are apt to neglect other precautions and lose their hogs.

A. C. WILLIAMS, M.D.

Industrial Societies.

THE CORNING (N. Y.) CANE SUGAR ASSOCIATION.

Mr. Reynold's Reply to Hector Bertram.

IN the RURAL of Dec. 20th there appears an article over the signature of Hector Bertram, which contains a number of misstatements. At the time I did not consider them worthy of a reply and should not make one now were it not for the fact that I am in correspondence with a number of your readers (strangers to me) for the further advancement of the sugar industry, and as the said H. B., for some reason unknown to me, continues to vent his malice in other journals, I feel now that it is necessary, in justice to myself and the Husbandman from which you copied the article, to make a plain statement of facts:—

Two years ago last summer Mr. D. W. Payne, of this place, spent several hundred dollars in experimenting with sugar beets. During his experiments I became very much interested. The next spring I obtained from the Agricultural Department at Washington some seed of the Early Amber cane, which I planted with great care on the 3rd of June—I think after my field corn was up. It was a good season for corn, and the cane made a splendid growth and ripened its seeds before frost. With the assistance of Mr. Payne I constructed a rude crusher, and hired a one-mule tread power to extract the juice. I boiled it down after the proper defecation, and succeeded at four different times in obtaining a good article of sirup, in two instances after the cane had been severely frozen. I exhibited these samples at our local fair and Farmers' Club, making a plain statement of the facts to our Club. It produced quite a desire among the members to try it themselves. Accordingly, when spring came, having about 50 pounds of seed, I donated it to the Club, each member taking what he wanted. Gen Le Duc, also very kindly sent me several packages which I distributed. The last season being very dry, the cane did not grow or do nearly as well as it did with me the preceding year, very little of it getting ripe. Many of the farmers who planted it, placed the seed too deep in the ground or too shallow, and others planted it on very dry ground or failed to "firm" it in sufficiently to sprout it.

In the fall, however, at an early meeting of the Club, it was found that among the members there were about two acres to be worked up. Ten of the gentlemen joined with myself and formed an association for the purpose of experimenting and working up our cane. Mr. H. D. Smith, the former president of our Club, was chosen president of the company and your humble servant secretary and treasurer. I sent at once to Cincinnati for a crusher. On its arrival, I superintended the placing of it, as well as the construction of the pans, arches and everything else connected with it. From the time the first stalk of cane went into the mill, until the last was ground and finished, I was away but three days, I think, and on those days I was invited by the Chemung Co. Fair and the Elmira Farmers' Club to their place to show them how to work up some cane and corn-stalks they had. I entirely neglected my farm affairs, and for two weeks worked night and day, often going home at two or three o'clock in the morning. I ordered chemicals from Prof. Stewart and the Clough Refining Co. But they failing to arrive at the first of our working, I experimented with those of my own manufacture. The chemicals purchased were placed in the tanks by myself alone. So much for my *personal supervision.*

As regards Mr. H. B's statement that, "the Corning Farmers' Club were surprised to find my first report coming indirectly through the RURAL, I will say that the sugar association had no meeting from the time we commenced work, up to the day in which the members met at the Farmers' Club, and during an intermission they gave in the measurements of their grounds, etc., which I placed on record, and Mr. Bertram forwarded the same for your publication, together with a statement that for $70 a crusher and pans suitable for working up the cane of a neighborhood, can be obtained. Our experiments the past season fully prove that a crusher of ample power and suitable pans for working 10 acres cannot be obtained for less than $150,—and I would much prefer to have the crusher alone cost that. At some future time I will try and give the readers of the RURAL a statement of the best and simplest method I know of for working up Amber cane and corn-stalks. During my visit to the Elmira Farmers' Club, President Hoffman called upon me to tell them something about what we were doing in Corning in the sugar industry. The few simple statements which I made to them from memory, *I think* fall very short of the complete report of the secretary of a sugar association that has accomplished as much as ours.

C. J. REYNOLDS.

I certify that the above is a true statement and that Mr. C. J. Reynolds is a gentleman of honor and integrity.

H. D. SMITH.
President of Corning Sugar Association.

[We publish the above with pleasure, in justice to Mr. Reynolds whose statements, from what we know of his character, would have been fully credited without the certificate which he has chosen to append to his communication. Should our friend Mr. Bertram entertain different views, he will agree with us that our columns are not a suitable place to present them. EDS.]

Scientific and Useful.

ADULTERATED CLOTHING.

PROFESSOR F. H. STORER.

A GOOD deal of nonsense, mixed with some grains of truth, is written from time to time by the professed philanthropists in respect to the adulteration of food. Of the adulteration of clothing, on the other hand, we hear comparatively little, though in all probability this subject is of paramount importance. The abundance and cheapness of cotton in this country, the familiarity of our manufacturers with the modes of working it, and, above all, the enormous demand for cheap and tasteful clothing on the part of the great American people, have led to the introduction of this less valuable fiber into ordinary "woolen" goods to an extent which but a few years since would have been almost inconceivable. Not only are so-called woolen goods prepared by weaving together mixtures of cotton and wool, rag-wool, and shoddy, in divers ways and in varying proportions; not only is the dust of wool (called "flocks") shrunk into woolen goods, even those of fairly good quality, to make them heavier and more compact; but by resorting to certain styles of goods and methods of weaving, so that the cloth shall be appropriately thickened in ribs or ridges, it has even been found possible to make clothes salable for men's winter wear out of nothing but cotton. Some samples of heavy cloths, which at first sight look as if they were certainly woolen and as if they were able to keep a man warm, and which really are thick and strong, have been found not to give off in burning any trace of the "burnt-wool" smell, with which everyone is familiar. Some years since, certain goods for gentlemen's wear were fashionable, which consisted of gray woolen with occasional golden threads of silk between. But of late, both the silk threads and the woolen parts as well, have been replaced with a really good imitation consisting of nothing but cotton. These debased goods are sold at low rates, and many of them are in good taste and of seemly ap-

pearance. They are durable no doubt, and the buyer commonly gets his money's worth. The only trouble is that, in most instances, they are not fit for the particular purposes for which they are bought. Cotton goods are not appropriate wear for anyone exposed to the winter's cold, in the northern United States. They have much less power to keep in the vital warmth or, in other words, to protect the wearer from cold, than is possessed by woolen or by silken goods. There is sound sense in the practice of those northern Chinese who habitually dress in silken raiment and put on one extra jacket of this material for each degree of cold.

The power of cotton, silk and wool to conduct heat was determined, in 1877, with special care, by Schuhmeister, of Vienna, with the result that, if the conducting power of air be called 1, that of silk is about 11, that of washed merino wool about 12, and that of cotton about 37, on the average in each case, and as nearly as may be. Each of the materials was in the unmanufactured condition and had been pulled apart with the fingers so as to bring it to a similar condition of aggregation with the others.

Of the cheap, thick goods made in imitation of woolen, which are sold for winter use upon every hand, it should in justice be said that they are good enough for (early) autumn wear, while the somewhat thinner goods sold in autumn are really well suited for much of the weather of our summers, at least for those on the sea-board. But for January, February, March, and parts of December and April, most of us need woolen and that of the best, Every man who wishes to avoid the neuralgias and rheumatisms which make life wearisome, to say nothing of the sharper pleurisies and pneumonias which make the grave-yards full, will do well to consult some other qualities besides mere thickness when selecting his winter clothing and that of his children. There are various familiar tests of wool, such as its softness and warmth and the peculiar odor which is given off when bits of it are burned. It is well, also, to ask the salesman whether he means cotton-wool, lamb's-wool, sheep's-wool or goat's-hair when he glibly assures us that the goods we are pricing are "all wool," for the phrase is one of many meanings. It is not only used every day in a "conventional" sense, dissimilar from its real significance, but often, I fear, in several senses in as many consecutive breaths. But for the inexperienced buyer, perhaps no test is so good as the selling price. When dealing with a fairly trustworthy merchant, we may safely count on his goods being rich in cotton in proportion as they are cheap. Other things, such as fineness and elegance, being equal, the cloths which contain most wool will be sold for most money.

Miscellaneous.

Notes.

GOLDEN RURAL TOMATO.—This tomato, of which the RURAL NEW-YORKER favored me with seeds, I think very highly of, but do not think the flavor to be quite as fine as that of the Acme, which I also raised for the first time the past season.

FARM BUILDINGS.—As a general thing, in the construction of farm-houses and outbuildings, not enough attention is given to the ornamental part of the work, although it is receiving more attention than formerly, which is a good sign. When a farmer erects a set of buildings, or even a single one, it should be made a point to build in such a manner that it will be an ornament to the landscape, as well as serve the purpose for which it was erected.

TREE AGENTS.—This class of men are again in the field for the winter campaign with their highly colored plates, and "flowery" language. Do not be led into paying high prices for so called new sorts of plants, or trees, to be repented of at length, when they are found to be worthless, or else old varieties under a new name, as is often the case. It is always best to buy of responsible nurserymen.

SPREADING MANURE.—When driving to the village the other day, I passed a field where the farmer was engaged in spreading manure from little heaps, which he had recently placed there. Now why this method is in so common practice I am unable to say, unless it is because "father done so," for it is certainly much easier to spread it directly from the wagon; besides, it can be distributed more evenly, and takes less time. F. H. D.

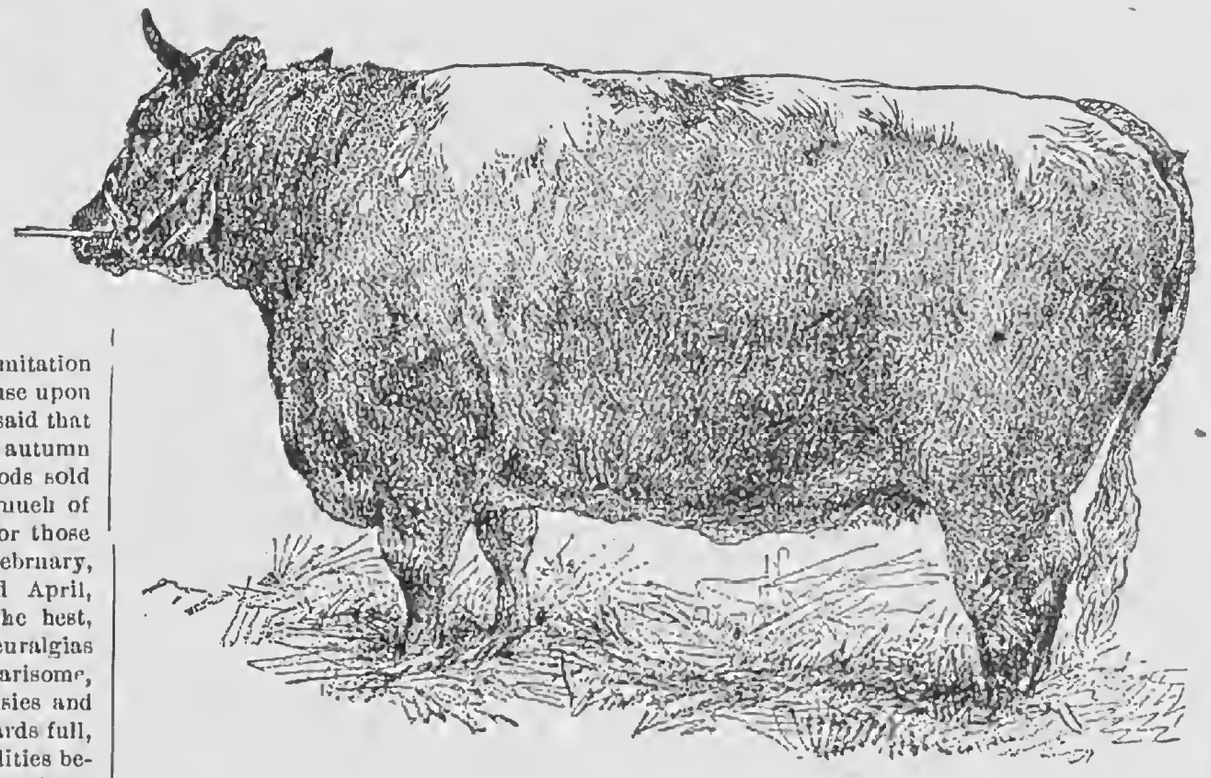
CATALOGUES, ETC., RECEIVED.

THE Farmers' Station Record. This is a Monthly, and the first number now before us is filled with interesting matter, a good deal of it from the pen of Mr. Conrad Wilson, its venerable editor. The plan of the publication and its peculiar objects we do not understand fully, and we must, therefore, defer a further consideration of the periodical for another time. It is published in this city, and communications addressed to Conrad Wilson, Box 2,695, will receive prompt attention.

FARM MANUAL—W. Atlee Burpee & Co., 221 Church St., Philadelphia, Pa.—Garden, farm and flower seeds—also blooded stock. This is not a very elegant catalogue, but there is a good deal of enterprise about it. We notice the Telephone pea here offered—also Teosinte (of which the RURAL has frequently spoken as of probable value for warm climates as a fodder plant), Blount's White Prolific corn, Doura, etc., etc. The catalogue also gives lists of all sorts of poultry, eggs for hatching, shepherd and other dogs, cattle, sheep, hogs, etc. Sent free.

BENSON, MAULE & CO., 223 Church St., Philadelphia, Pa.—Illustrated and Descriptive Catalogue of Garden, Field and Flower seeds; also a selection of small fruits, trees, plants, bulbs; also a price list of thoroughbred stock and eggs for hatching. Free to applicants.

NOTE.—In referring to the Catalogue of E. & J. Williams (Montclair, N. J.), we said that their fine Raspberry, the "Montclair," is now, for the first, offered for sale. In this we were mistaken. They hope to offer plants "in limited quantities *another year*."



MR. RATCLIFFE'S SHORT-HORN HEIFER.—FIG. 31

The Herdsman.

A SURE MARKET FOR YOUNG SHORT-HORN BULLS.

THE great Western Plains may be depended upon for many years to come as a good and certain market for them, as it is found that they make a more rapid improvement in their progeny, when crossed upon the wild Texan and other common cows, than any other breed. The trouble and expense of placing them there in small numbers, have till recently been so great, and they arrived at their several places of destination in such poor condition generally, as told greatly against them, and no one there could be tempted to give their real value. Thus, there was usually a loss to the breeders of these bulls rather than a gain in transporting them to the Western Plains. But now, by clubbing and taking a large number together in cars, with careful attendants and plenty of forage, these young bulls are delivered in excellent condition, and at a cheap rate, at any point required on the railroads; and it being advertised extensively beforehand that they would be for sale at such places on certain days, Western breeders flock in from all quarters to purchase, and are found willing, under these circumstances, to pay fair prices.

Steers suitable for exportation to Europe are the most profitable sort for the breeder to produce, and the feeder to market; and the nearer these approach the oblong, square, blocky form of the Short-horns, the more beef of a superior quality they will make for the food consumed, and the higher is the price it will fetch in the European market. Thus ensues a double advantage in breeding such grades—meat at less cost in production to the breeder and feeder and the obtaining of a greater sum for it. In order to make the most rapid improvement in grade stock, thoroughbred bulls alone should be used; and those of the best constitution, most compact in form and finest in all their points; are to be preferred.

OUR ANIMAL PORTRAITS.—The accompanying portrait represents Mr. Ratcliffe's Champion heifer at the late Islington, Eng. fat stock show. She is a very fine specimen of the Short-horn breed; having in her the blood of the Princess and the old Moss Rose tribes. The engraving is redrawn from the English Agricultural Gazette.

COLIC IN HORSES.—I am satisfied that this is produced from indigestion more often than from other causes. I had two horses, one of which would not eat cut hay wetted and mixed up with meal, while the other ate it greedily. The latter was affected often with colic, while the former was never attacked. The colic would continue severely for several hours, although I administered the best advised medicines for it, and the horse would not eat anything after the attack for a whole day, and sometimes longer.

The feed thus given with the cut hay was usually two quarts of Indian meal, two quarts of wheat bran, and one pint of oil meal, morning, noon and night. I presume wetting them all up together clogged in the stomach and caused the colic. Considering this, I subsequently fed the meal ration dry by itself, and gave the horse dry, uncut hay; since this it has not had a single attack of colic.

A. B. ALLEN.

Various.

AGRICULTURAL NEWS.

THE fifth annual meeting of the N. J. State Horticultural Society was held at Newark, January 15th and 16th, with a large attendance, and much interest manifested. The officers elected for the ensuing year are Pres., Jno. S. Collins, Moorestown; Rec. Sec. J. T. Lovett, Little Silver; Treas., W. H. Goldsmith, Newark. . . The owners of the Cook Evaporator patents are asking for their extension. Farmers in Ill., and Mo., are petitioning Congress against granting the extension as detrimental to the rapidly extending sorghum cane-growing interests of the country. . . In Minnesota 28,000 acres of prairie land were planted to trees in 1879 and 250,945 rods were planted in rows along the R. R's. . . A new deposit of guano has been discovered in caves near Cape Town, Africa. . . The farm products of Ill. in 1879 amounted to $200,000,000, estimated to be double the product of all the gold and silver mines in the country . . A beet sugar factory is to be started at Low Point, Dutchess Co., N. Y. . . Of dried apples 230 tons are said to have been shipped from Sodus N. Y., since the crops were gathered. . . At the annual meeting of the Western N. Y., Ag. Soc., held the other day at Rochester, a committee was appointed to select some other place for holding the fair on account of the small encouragement offered by the people there and the sneers of the press. The yearly receipts were $11,942.06 and the expenditures $11,989.16. . . . Arkansas ranks next to Texas as a cotton-producing State. . . In northern Texas, recent rains have put wheat fields into fine condition. . . The Tennessee Stock-breeder's Association will hold their fourth annual meeting at Nashville, Feb. 10, W. S. Shields, of Granger, Pres. . . It is estimated that two-thirds of the arable land of Louisiana have never been brought into cultivation. . . Kentucky shippers intimate that nearly all the ripe cattle from that state for this season's market are marketed. . . A sheep farm of 13,000 acres was recently purchased in Greeley county, Neb., at an average of 75 cents per acre, the railroad company allowing a large discount for cash. . . At the last meeting of the Lexington, Ky., Live Stock company a committee was appointed to raise money to give a great banquet to the breeders of Short-horns throughout the United States and Canada, at Lexington, the last Tuesday in July, 1880. . . Receipts of hogs during the year just closed, at Cincinnati, 947,976; shipments, 168,543; cattle receipts, 203,616; shipments, 87,422; sheep receipts, 443,184; shipments, 361,879. . . Cleveland, O., ranks now as the third hog-packing city in the U. S. The total number of hogs packed the past year 480,000—an increase of 100,000 over the preceding year. . . Three dollars a bushel is the price of corn in Deadwood, Dakota. . . The freight on Iowa butter to Boston is 60c. per 100 lbs., that on Vermont butter 80c. to $1. . . In future, queen bees are allowed to travel by mail, with their necessary attendants, so long as no one is injured in handling them. . . It is the general opinion of Cuban planters that the sugar crop will not amount to three-quarters of last year's crop. . . A poor and very short tobacco crop is also anticipated owing to severe drought. . . Advance sheets of the crop report of the State Board of Agriculture of Illinois, show that the winter wheat acreage now sown in that State is 2,658,826, or 25 per cent. greater than last year. . . The N. Y. State Agricultural Society held its annual meeting in Albany on 21st inst. . . Ex-Gov. Seymour, its President for the past year delivered a fine address on the conflict between European and American agriculture. The following officers for the ensuing year were elected:—President—General N. Martin Curtiss, of St. Lawrence county. Vice-Presidents—John D. Wing, of New York; Isaac H. Cocks, of Queens; Joseph Hilton and George F. Mills, of Montgomery; James Geddes, of Onondaga; John Julland, of Chenango; Robert J. Swan, of Seneca, and Marcus H. Phillips, of Orleans. Corresponding Secretary—T. I. Harrison, of St. Lawrence. Recording Secretary—W. H. Bogart, of Cayuga. Treasurer—Adin Thayer, of Rensselaer. Executive Committee—Jesse Owen, of Chemung; D. D. S. Brown, of Monroe; I. L. Hoxie, of Otsego; J. V. H. Scoville, of Oneida; George Tweddle, of Albany; Gerrit S. Miller, of Madison; I. J. Deforest, of Schenectady, and David Cassett, of Onondaga. . . A telegram from Lake Charles, Louisiana, last Wednesday, says: "April weather continues here. Orange, fig, peach and plum trees are budding and strawberries are in blossom. . . Serious inundations and damage to property are graphed from Holland and Poland. . . . Cattle raising is likely to supersede cotton raising in some parts of Georgia. . . The New Orleans Cotton Exchange has decided, by 109 against 78 votes, to deal in cotton "futures" henceforth on the New York system. . . Wine-making in Australia is becoming an important industry—the total yield this season is put down at 396,000 gallons. . . The Humane Live Stock Co. of this City, are building 250 patent stock cars, with feed and water troughs and separating partitions. Cars about six feet longer than present stock cars, designed to carry stock long distances without loading and unloading—The first of a needed enterprise. . . There are about 60,000 Mennonites in America. They have 500 meeting houses, one-eighth of that number being in Canada. They abstain from taking an oath, do not inflict punishment, do not accept public office and never go to law They are nearly all farmers . . The Pennsylvania State Dairymen's Association will hold its Sixth Annual Convention at the new Library Hall, Meadville, on February 4th and 5th. Addresses will be delivered, among others, by Pres. Lenhart, S. A. Farrington, John Fuller, X. A. Willard, Hon. S. H. Findlay. This is usually one of the most instructive dairy conventions in the country, and it is therefore to be hoped that the attendance will be large. . . An Amber sugar-cane Association has been established in Fond-du-Lac Co., Wis. . . Last year's crops, according to the Ag. Dep. were worth $300,000,000 more than those of '78. . . The Northwestern Dairymen's Association will hold its annual meeting at Milwaukee, Feb 26. . . The Dairymen's Association of Northern Ia. will do ditto at Montecello, same date. . . The annual meeting of the N. J. State Agricultural Society was held at Trenton, June 21, and was largely attended. The old board of directors was re-elected, except the substitution of W. F. Kidder for the late J. R. Kilburn. The Treasurer's report shows a balance of $1,000 50 on hand. . . The Northeastern Bee-Keepers' Association will hold its 10th annual convention at the City Hall, Utica, N. Y., Feb. 11, 12, 12. Liberal prizes offered for the best essays on topics of interest and importance to bee-keepers, and also for various implements needed in apiculture. . The Ohio Poland-China Record is now ready for the press; so writes to us J. M. Milliken, Hamilton, Ohio . . Chicago received 137,760,380 bushels of grain last year, and claims that no other city in the world could have handled so vast a quantity. . . In Morehouse parish, La., a boy of 13, who went to school last year in his leisure time raised 600 pounds of cotton, which he sold for $70, doing all the labor himself—a white at that. . . Planters are still picking cotton in some parts of La . . The mule trade is lively throughout Middle and Western Tenn . . The French hope that the severe weather has killed the phylloxera, but fear that it has killed the vines also. . . Upwards of 6,000 sheep are reported to be fattening in Yates Co., N. Y. . . The Grand Master of the Wisconsin Grangers says the co-operative stores have been grandly successful. . . Floods in Columbia, S. A., have done immense damage. . . The proposed Congressional investigation of the Department of Agriculture is to be deferred until complete preparations have been made for a thorough overhauling The scope of the investigation includes an examination into the history, systems, and workings of the Department for some years back with a view to its re-organization on a new and enlarged basis. There seems to be no special animus against the present Commissioner—it's the system, not the man, that is mainly found fault with. . . For 1879 Nebraska gives the largest average yield of corn per acre, amounting to 45 bushels, and Colorado the largest average of wheat, amounting to 23.1 bushels per acre . . Col. Wilkins, of the "York Farm," in Maryland, raised this year an aggregate crop of 70,000 bushels of peaches, which were sold for about $42,000. . . The peanut crop of Virginia, Tennessee and North Carolina is estimated at about 1,835,000 bushels—an increase of about 500,000 bushels over last year. . . In 1867, 42,000,000 head of sheep produced 147,000,000 pounds of wool; in 1877, 35,000,000 head produced 208,000,000 pounds; this shows a wonderful improvement in the *science* of sheep husbandry, inasmuch as 7,000,000 less sheep produced 60,000,000 pounds more wool! ! !

Everywhere.

LIFE IN THE ROCKY MOUNTAINS.

MANY of our readers of the RURAL, living in the land of formal and steady habits, among the hills and vales of their native States, in towns and farm-houses often a century or more old, can form little idea of the great difference between their surroundings and ours. The writer was born on a beautiful, wooded slope, in old Chautauqua, in sight of Erie's beautiful blue, where the scarlet strawberry peeped from the verdure of the meadows, and the woodside furnished raspberries, blackberries and mandrake, each in its season; where youth, with its ever-remembered pastimes, was spent. But he has wandered far from that blissful spot, and now, when gray hairs begin to lighten his dark locks, he finds himself away in the midst of the Rocky Mountains, where from his vine-clad cottage he can contemplate snow-clad peaks, or in a day's ride reach mountain gorges where the soughing Pines shadow the rippling and dancing streamlets that glisten with ice in mid-summer, at the moment when the blushing peach, toothsome fig and glossy prune are in their most delicious condition.

The climate here is dry, and in summer is generally rainless, so we have to irrigate our gardens, orchards, vineyards and fields by diverting mountain streams and bringing them out upon the most fertile lands in the valleys. From these ditches the water for stock and domestic use is taken. As a general thing, the people of this country all live in cities and towns, and thus the combined efforts of all the citizens of a town are used to make and keep in repair the main canal that brings the water, each sharing in the supply in proportion to the amount he has paid. This is brought through every street in the town or city, and each in turn waters his garden and grounds and what is not thus needed is used to water field crops adjoining the town. Thus, by people living together they are enabled to have good schools, and by a union of efforts, help each other in other ways.

There are very few wild fruits here, as lands not irrigated are desert, where stunted shrubs alone grow sparsely, except away up in the mountains, where rains make trees, grass and shrubs grow more abundantly. We raise fruit, however, in abundance and of the finest quality and richness; namely, apples, peaches, plums, pears, apricots, prunes, nectarines, figs, almonds, berries and the most delicious grapes, and these, ripening in succession from April to December, give us a long season of enjoyment. Oranges and lemons may also be grown here in sheltered places. Of native nuts, we have only the pine nut, which is abundant in some seasons, and brought in for sale by the Indians. They are very sweet and rich, though small. Every lady likes and eats them when they are to be had. In our gardens we grow some English and Black Walnuts.

Our towns are laid out in acre lots, that we may have good space for fruit and vegetables, and on each side of the street a babbling stream flows, watering a row of trees. So our towns seem shady and forest-like. In summer they are very pleasant, and in spring, when the trees are in bloom and the garden flowers give their perfumes, it is doubly delightful. We have a very interesting group of native plants and flowers many of which flourish in dry soils with little or no water, some producing magnificent blooms, and such strange and fantastical shapes. Among these are the Cactus, Yucca, Agave, Ferns, etc. There are also annual and perennial herbaceous plants, some giving blooms, of great beauty. Even some desert shrubs would make charming additions to the old collections extant in the East.

Washington Co., Utah. J. E. JOHNSON.

RURAL SPECIAL REPORTS.

CANADA, Ilderton, Ont., Jan. 16.—Cattle trade brisk, especially for bulls. Closing your ports against us has stimulated our farmers. They now know all our surplus must go to England, as it will pay to send thither well-bred steers only—hence the demand for bulls.

R. G.

COLORADO, Fort Collins, Larimer Co., Jan. 14.—We have just returned from a trip to Southern Colorado—a section one cannot appreciate in any way without seeing it. Two days' ride over the Colorado Central and the Denver and Rio Grande Railroads, brought us into the great San Luis Park, containing over a million of acres. It is one of the most magnificent bodies of land in the world, rich and unsurpassed by the valleys of the great rivers. The entire Park is surrounded by high mountains abruptly rising to the hight of several thousand feet. This immense plain seems to have been a vast lake which, once upon a time, cut through the rocky peaks and made its way to the Gulf, leaving as its path the beautiful Rio Grande. Almost all of it thus far has been untouched and "undefiled by man." It is government land and is open to settlers. There is room enough for 50,000 families, and water enough to irrigate every acre. Wheat, oats, barley, potatoes, and almost any vegetable grow most luxuriantly, and with but little cultivation. Hay is raised at the small expense of about $2 50 per ton, and sold for $20 on the ground. Potatoes are planted in every third furrow behind the plow, and without any culture whatever they turn out from 100 to 500 bushels per acre. The only discouraging features of this great and fertile tract is the altitude (7,749 feet), and the Mexican "greasers" who occupy the best and richest sections. Del Norte is an old mining town situated at the extreme west end of the Park. But for "drinking," it would be quite a pleasant place to live in. * * *

IOWA, Marshall Co., Jan. 12.—We are having a very open winter hereabouts—no snow to speak of; the frost was nearly out of the ground last week, but it has frozen up again now. The price of grain here varies with the Chicago market: wheat, 25c.; corn, 15c. and oats 10c., *less* than in Chicago. Butter 22c.; eggs, 18c.; hay, $5 per ton. N. L. C.

KANSAS, Bala, Riley Co., Jan. 17.—Prices here are: wheat, fall, $1@1.35; spring, 75c.@$1; corn, 20c@25c.; hogs, $3.25@$4; oats, 25c@30c.; rye, 50c@75c.; potatoes, 80c.@$1.

H. F. J.

KY., Wilsonville, Spencer Co., Jan. 14.—We have had only two spells cold enough to enable us to save our meat. Owing to the very open winter many hereabouts have not been so fortunate as to save their bacon, and a good deal of meat has been lost. Grass looks as it generally does in April. J. P. P.

MICH. Unionville, Tuscola Co., Jan. 14.—We have had a very open winter so far—about six inches of snow and about two weeks of passable sleighing. It is colder now with a slight covering of snow. The wheat looks first-rate; with good weather from this time on we shall have a large crop. Our crops were very good last year. Wheat is selling here for $1.25@$1.27; oats, 40@45c.; corn, 50c.; potatoes, 35@40c.; butter, 20c. per pound; eggs, 20c. per doz.; pork and beef, $4@5 per 100 pounds. About one and a quarter to one and a half times more wheat was sown here last fall than ever before. This part of the country is quite newly settled and all have done the best they could.

L. A R. NO 2.

MINN., Howard Lake, Wright Co., Jan 13.—We are now, for a few days, enjoying good, solid cold weather with little prospect or hopes of more snow. The thermometer is ranging from zero to 20 degrees below, and some say 30. The first week and more of this month, gave us a regular January thaw, and we lost nearly all our good sleighing. Previous to that, farmers and everybody were literally rejoicing over the good roads, which were better than for years before, at that season, and lasted through the entire month of Dec., which month toward the last brought some stinging cold weather which you have no doubt heard of ere this. But how could I write the news when the thermometer ranged from 30 to 58 degrees below zero scarcely 20 feet from me! I thought I knew Minnesota pretty well before, but our thermometers usually froze up at 44 deg. The severity of our weather farther west on the prairies at such times causes too much suffering and bereavement to warrant badinage, when we think of so many perishing in consequence of it. Probably not so many were frozen this year as were during the sudden as well as violent storm of three days in January of '73. That storm was more fearful, but the weather was not so cold. The night of the 23rd of Dec. was windy enough, and showed us a grand display of a large meteor, appearing to divide and fall in different places. This happened near the peep of day in this vicinity—the brilliancy of the display lasted about three minutes. Better times! Wheat which is mostly No. 1. is now bringing at the elevator $1 10, and last week brought two cents more; corn, 30 cents; potatoes, 25c; butter, 15 to 20 cts. Were it not for old debts hanging incubus-like over most farmers, they would be happy. If they would only act upon what the RURAL NEW-YORKER has said on that subject, they would be wiser and soon be out of debt—and keep out all the time. Nearly sixty thousand bushels of wheat have been received at the elevators at this point on the St. Paul and Pacific R. R. A. M.

N. Y., Corning, Steuben Co., Jan. 13.—We are having a very open winter. Thus far there has been but little snow—at present only about two inches, and that fell yesterday. The ground is not frozen, and last Friday and Saturday I noticed a number of farmers plowing. Those who contemplated doing a lot of lumbering, are somewhat disappointed, and are afraid that they cannot do all they had intended, as it is getting late. The weather has been very changeable—the thermometer at night marking perhaps down near to zero, and the next morning up to freezing point, or above; but we have not had nearly as cold weather as is reported from all around us. Sunday, the 14th of December, was the coldest morning thus far in our neighborhood, and then the mercury was only one deg. below zero at 8 A. M. Much complaint is yet heard on all sides, of scarcity of water, as the usual fall rains did not come in sufficient quantity to raise many of the springs. The roads are now, most of the time, very muddy, and disagreeable to travel.

F. H. D.

TEXAS, Caldwell, Burleson Co., Jan. 10.—The new year is ushered in with an abundance of rain. On the 24th of last month we had the severest cold known to the oldest inhabitant, lasting five or six days; since then it has rained more or less up to date. Last year will be remembered here as the "Dry Year." Corn is scarce and chaffy; cotton less than a quarter of a crop; wheat and oats were almost entirely killed by the Christmas cold. Rye has come out and looks as well as ever. There will be quite a harvest of poor cow-hides this spring. Corn has jumped to $1.12, while wheat brings only $1, which shows how poor it is. Good wheat should be worth more than corn. Notwithstanding the hard times, people are going to work with a will to raise another year's crops The Gulf, Colorado and Santa Fe R. R will probably reach Caldwell by June. People are compelled to kill hogs off after having been fed only on what little mast there has been. Pork is consequently a thin article, but it sells from 3½ to 4 cents per pound. We had eggs all winter till the cold snap. The hens will resume business in a few days. We can have eggs all winter here with very little trouble. For the last 10 days it has been as warm as April. Cotton, beans, etc., etc., are coming up freely—volunteers I mean. D. H. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

Short-horns and Holsteins.

E. S., Eagle Harbor, N. Y., asks, 1, the addresses of breeders of Short-horns not too far away; 2, the comparative merits of Short-horns and Holsteins.

ANS.—Jonathan Talcot, Rome, N. Y., R. H. Allen, 189 and 191 Water St., N. Y., C. Parsons, Jr., Galway, Mass. 2, There is not a little similarity between the claims put forth in behalf of the Short-horns and the Holsteins. Both are massive beasts; both need extra care and feed to produce the best results; both mature early and lay on flesh readily and economically, and under certain conditions both yield large messes of milk; while in its native country, England, the Short-horn holds a position nearly as unrivalled as that occupied by the Holstein in its native country, Holland. For the last half century, however, or more, the Short-horn has been bred chiefly for beef, and in this country almost entirely so, and consequently the deep-milking qualities of the original race have, as a rule, greatly deteriorated. Occasionally, especially in the States east of the Alleghanies, some selected herds of the breed are found that do so well at the pail as to prove that care and selection would ere long re-develop the deep-milking qualities that first attracted attention to the race. There are a few families of Short-horns, too, that have always been bred for milk as well as for meat, such as most of the Bates' stock and Princess tribe, and these have generally been satisfactory milkers. As a rule, however, the modern American Short-horn is a poor milker, but on good feed matures at least as early and lays on a first-rate quality of flesh at least as readily and at as little cost of feed as any breed, while the males are remarkable for their prepotency, strongly impressing the special characteristics of the race on crosses with other breeds, but still more markedly on crosses with native or grade cows. In breeding the Holsteins, on the other hand, milk has always been the main object, and early maturity and aptitude to fatten have been secondary considerations. Being a very ancient race, probably the most ancient of our modern breeds, the Holstein also is strongly prepotent. For beef the Short-horn, no doubt, is preferable to the Holsteins; a natural result of the end for which it has, for many Short-horn generations been bred; for milk, however, the Holstein has decidedly the advantage, a natural result, also, of the aim kept in view for centuries by its breeders. For milk and beef combined there would probably be not much difference between a good Holstein and a good Short-horn of some deep-milking family. Of late, however, there is a growing conviction that in the manufacture of beef and milk there is as much profit in a division of labor as in the manufacture of pig-iron and steel, and consequently, there is an increasing tendency to look to the spare breeds, such as the Jerseys and Ayrshires, for milk and its products, and to the beef breeds, such as the Short-horns and Herefords, for our meat supply—the grades of each being often better for their respective objects than even the pure-bred stock.

Hogs—Alive and Dressed.

L. H. N., La Porte, Ind., asks what should be the difference in price between live and dressed hogs to pay the same to the farmer.

ANS.—Personally we have made no experiments by which we could determine this question, but on looking over our Scrap Book, we find an account of an experiment, clipped from some paper whose name was unfortunately omitted, which just answers the query. The writer says that this year he selected 20 pigs farrowed the last week in May, from five litters, all cross-bred Suffolk and Polland China. They had nothing but thin grazing after being weaned, till the corn was large enough to feed, since when they had been fed well, and though not large, were well fattened. The following are the exact weights alive, and dressed:

No.	Live wt.	Dressed wt.
1	172	143
2	151	128
3	155	130
4	126	104
5	135	116
6	163	136
7	130	108
8	136	114
9	153	128
10	148	120
11	131	112
12	176	145
13	148	118
14	153	128
15	164	138
16	148	120
17	133	115
18	168	139
19	132	114
20	113	91
Total	2,935	2,447

The shrinkage, therefore, was 488 pounds, or a trifle over one-seventh. He was offered $4 per 100 for the lot on foot, which would have amounted to $117 40. He sold them for $5.10 dressed, amounting to $125.02, leaving $7.62 in favor of dressing at these prices, and the rough lard was sufficient to pay for butchering. This class of pigs are said to shrink much more than the larger and older hogs. Farmers can look this over at their leisure and decide how they will sell. To determine the vexed question how much less a hog will weigh after being stuck than when alive, he weighed the two first before scalding, and the loss was 8 and 7½ pounds respectively.

Feeding Linseed Meal.

R. G., address mislaid, asks 1, whether linseed meal can be fed dry with other food, with as much good effect as if it were soaked; 2, is it good for fattening hogs.

ANS.—1. Linseed meal may be fed dry with benefit and without danger. All rich, concentrated food is best fed dry; if soaked, it can be swallowed without chewing; but no animal can swallow fine, dry food without chewing it and mixing it with saliva. The saliva has considerable solvent powers, and exercises an important office in the digestive process. It is a highly complex fluid, containing potash, soda, lime, ptyaline—a substance which changes starch into sugar—and alkaline chlorides, phosphates and sulphates. One function of the saliva is evidently to prepare food for digestion, and in feeding, this should be always considered. Food bolted or gorged is unmixed with saliva, and thus theoretically the food should be given dry, so that it may be masticated and mixed with saliva; practice proves the truth of the theory. Linseed has a laxative and softening effect, and the meal may be given alone beneficially. 2. It is good for any fattening animal, but for hogs it is a dear food as compared with corn. Hogs fatten better on corn, or other starchy food, than on such oily food as linseed.

The Honey Locust as a Hedge.

W. C. W., Atlantic, Iowa, writes: 1, Is the Honey Locust worth anything for hedges? 2, What time should the seed be sown—fall or spring? 3, Will the Barberry make a good hedge? The Osage Orange has proved a failure in that locality, and wanting to start a live fence, he desires the information asked for above.

ANS.—1. In northern localities where the Osage Orange is not hardy, no better hedge plant can be found than the Honey Locust. It is "iron-clad" as to hardiness; will, with judicious pruning, form a very close and durable hedge, and its strong and thickly set thorns are particularly disagreeable to breachy animals. 2. The seeds should be sown in spring. They can be purchased of all large seedsmen. 3. The Barberry will do as a hedge plant, but it falls much behind the Honey Locust. Besides being less defensive, its leaves form a lodging-place for the fungus known as wheat rust, in a certain stage of its development, and to plant the Barberry is to encourage the wheat rust. This fact alone should be enough to prevent its use as a hedge plant, even were it the best for that purpose.

Muck.

S. H., Montgomery, N. Y., says he has heard much about the value of muck as a fertilizer, and wants to know if it would be advisable to dig holes and thus destroy the land in order to obtain the muck.

ANS.—It will depend upon circumstances. There is no doubt that muck has value as a fertilizer, but this value is not a contant quantity; it varies with the land to which it is applied as well as with the constituents of the muck itself. But generally it is advisable to take out the muck, at the sacrifice of a small plat of arable land, and, indeed, the muck bed if the surface is unmixed with any other

has but little value for cultivation. Should the muck deposit lie in a shallow layer on the surface and form arable land, we should hesitate before digging it out for manurial purposes. In that case it would be well to apply muck to the land in a small way and note the effect. If the result was greatly to increase the crop, the practical farmer could easily calculate whether the benefits derived from its use would outweigh the injury to the land from which the muck was taken.

About Water-Cresses.

Constant Reader, St. Charles, Ill., asks: 1, how water-cresses are prepared for market, and about how much are they sold for: 2, when should they be planted.

ANS.—1, They are commonly sold in the market in baskets holding three or four quarts. When first offered the price is generally $1 for such baskets. This price varies from season to season. 2, Early spring. The roots are best planted in spring in shallow, running water. They increase rapidly, as well from the spread of the roots as from the seeds which the plants sow. The shoots should be cut, not pulled or broken off, which destroys or weakens the plants. After they become well established, they may be cut almost weekly during the summer. A profitable price may always be obtained for water-cresses.

Curing Skins.

A. W. B., Monument, Mass., asks for a recipe for curing skins, such as those of musk-rat and mink, so that they can be made into carriage robes.

ANS.—Stretch the skins on a board or a frame, and scrape off all the flesh. If they are dry, soak them with warm water on the fleshy side, then cover them on the same side with a mixture of powdered alum and salt in equal parts; lay the skins together in pairs, fleshy sides together. After a week, shake out the skins, and add some fresh mixture. When the skins are completely "tawed" (not tanned), stretch them and rub them with chalk and pumice-stone until no more chalk will be absorbed, then pull and stretch gently until dry and soft.

Miscellaneous.

C. W. W., Lewis Co., N. Y., wishes to know where the Blue Pearmain apple originated, it being grown on two or three farms only in his locality, having been taken there some years ago and grafted upon other trees.

ANS.—Mr. Charles Downing, in reply to the above inquiry, says:—"I have never seen any origin given to the Blue Pearmain, but it is an old and very good variety as to flavor, but only a moderate bearer, and is not now much cultivated." We acknowledge a box of apples from C. W. W., and regret that we cannot give the information sought. We can only say that several of those marked "Seedlings" were of excellent quality, and should be propagated. Probably grafting will not materially change the quality.

A. C. H., Roanoke, Ind., asks, 1, where he can get the Kieffer Pear; 2, when must Larch seeds be gathered to grow best; 3, which kind of Catalpa would grow the best and make the best timber in Western Kansas; 4, when should it be planted; 5, where and at what price can reliable seed be bought.

ANS.—1, Of J. S. Collins, Moorestown, N. J. 2. Just as soon as ripe in autumn, and they should be preserved in sand. Sow early in spring in boxes of light sandy soil; 3, Catalpa speciosa. The wood is thought to be almost unequaled for durability. 4, Spring. 5, Young seedlings can be purchased at a very low price in large quantities, of R. Douglas & Sons Waukegan, Ills., who make a specialty of it.

D. J. H. & several others in various places ask whether La Belle M'f'g. Co. of Chicago, Ill. is a trustworthy concern; whether it will do what it promises and whether "there is money" in its business.

ANS.—This concern has the reputation of doing business honestly. So far as we have been able to learn, they do what they say they will, just as do other "square" business firms. Whether their business will "pay" an agent or not, will depend in a great measure upon his own energy, address and persuasiveness as a canvasser. The letter copying book and ink for the sale of which they want agents, are good enough things in themselves. Of course, a fair share of business caution is always desirable in dealing with strangers.

A. R., address mislaid, asks 1, how to germinate the hardy shrub seeds of the RURAL'S last free seed distribution; 2, which would be more advisable—to purchase ground bone at $60 per ton of 2,000 pounds, or manure from a livery stable at 50c. a load, to be hauled three miles for wheat or corn on clay soil.

ANS.—1. We know of no better way than to sow in well-drained flower pots of mellow soil. Cover them with glasses If you had a greenhouse, bottom heat would facilitate germination. 2. We should choose the manure at 50c. per load.

NOTE.—Thank you for your interest in the RURAL'S behalf.

T. G. T., Horn Brook, Pa., has had a choice bulb presented to her by a lady. The only name she knew for it was "Spirit of Santia" by which name it is known in Chili, S. A. She has never seen the flower, but it is said to be of a peculiar shape, resembling a white dove. The plant has now two leaves of a very dark green. She wants to know its proper name and culture, for all the books and catalogues at her disposal have been searched in vain for this information.

ANS.—The plant referred to is an orchid, Peristeria elata, also called the Dove Plant. It is a choice tropical plant and requires to be kept in a high temperature, (about 70° or 75°) to grow to perfection. Plant in a light, loamy soil and water freely during the growing season.

L. L. C., Catherine, N. Y., asks whether the Rural Life, a monthly agricultural periodical started in this city about a year ago, is still in existence, as several subscribers in that neighborhood, although they paid subscriptions for a year, have not seen it or heard of it since August.

ANS.—The Rural Life was discontinued several months ago. It may again resume. We do not know.

M. M. W., Belle Vernon, Pa., asks where he can obtain information on tobacco culture.

ANS.—The RURAL has published several articles on this subject during the past year—see pages 277, 311, 226, 534—and will also treat of it during the current year. "Tobacco Culture, by 14 Experienced Cultivators" price 25c. gives a great deal of information on the industry in different places, and can be had through the American News Co., of this city.

G. C. W., New Florence, Pa., asks, 1, where he can get some spring rye; 2, what is it worth per bushel, what kind of ground suits it best, how many bushels per acre will it average; 3, what kind of chickens are the most profitable to raise for early market.

ANS.—1, Of any seedsman. 2, $1 75 per bushel. We have never had any success with spring rye. Perhaps some of our readers will answer. 3. We should prefer Plymouth Rocks. We do not know the person you inquire about.

P. L. C., Hedges, Ky., sends us a specimen of a pea or bean, and asks its name. The people in the mountains thereabouts use them in a half-ripe state for food, and as they are extremely prolific, only a small patch is planted by each. From our engraving in a late number, he thinks it must be some variety of the Cow Pea. There, however, its only name is the "long-pod" bean or pea.

ANS.—Yes, it is one of the Cow Peas, closely akin to the variety known as Whip-Poor-Will.

R. H., Harlan Co., says he has an ample supply of wild (choke) cherry and wild plum stocks and asks what he can work on them advantageously.

ANS.—We are not aware that the wild choke cherry can be used as a stock to work upon. Wild plum stocks are often used to work the cultivated varieties on; but they should be grafted or budded at, or just below, the ground, otherwise the graft will over-grow the stock.

J. L., Edinburgh Pa., 1, asks whether Plymouth Rocks and Asiatic fowls are kept on the RURAL FARM for sale; 2, if not, where can they be bought.

ANS.—1, Absolutely nothing is for sale connected in any way with the RURAL or its Experimental Grounds. 2, Both kinds can be purchased from several parties who are in the habit of advertising in the RURAL, such as G. E. Josslyn, Fredonia, N. Y., and others.

A Constant Reader, Oconomowoc, Wis., and A. C. H., Roanoke, Ind. inquires about cane mills and evaporators.

ANS.—Both the Vermont Farm Machine Co., Bellows Falls, Vt., and the Blymyer Mfg. Co. of Cincinnati, Ohio, make excellent mills and evaporators. Prices vary with sizes, etc., but all information will be promptly furnished by both firms on application.

H. S. B., Catskill, N. Y., asks where and at what price can refuse salt be purchased.

ANS.—At the salt works in Syracuse or in this city. Almost every salt-laden vessel coming to this port has a great deal of damaged salt on board, good enough for fertilizing purposes, however. The price is usually from 15c. to 20c. per bushel, and sometimes even less.

J. B., Ea. Schodock, N. Y. asks where he can get a work on the manufacture of opium, that will describe the necessary machinery and give the *modus operandi* in all its details.

ANS.—There are several works on the character and effect of opium when used as a medicine and to excess, but we know of none that offers all the information here desired.

G. H. A., New Haven, Conn., asks if there is such a thing as a pure white Gladiolus—one neither striped nor blotched with any other color.

ANS.—There is no pure white Gladiolus yet, as far as we know, but at the various floral exhibitions of last season we have seen some that were *almost* entirely white.

Little Girl, Van Wert, Ohio, asks whether "Uncle Mark" will have any choice seeds to distribute this year, and if so, where should he be addressed to secure them.

ANS.—1. He will have some next season. He should be addressed at this office.

K. H., Bolington, Va., asks what is the best and most comprehensive work on the diseases of horses.

ANS.—Stonehenge's. "The Horse in the Stable and the Field" $3 50, is as good as any with which we are acquainted.

S. Houghton, Lowell, Mich., asks where he can get some seeds of the Golden Rural tomato.

ANS.—We have given full address in the hopes some of our readers who have saved seeds may oblige our friend. We have none left and are working with other sorts.

F. B. O., Scipioville, N. Y. writes, will you please give me the address of some one who furnishes chemists materials,—flasks, glass tubes, retorts etc?

ANS —E. B. Benjamin, 10 Barclay St., N. Y. City.

J. W. H., Jersey City, N. J., asks what are the laws relating to setting trees on the roadside in New York State.

ANS.—See article on the subject under Arboricultural, in this issue.

J. L., Pharsalia, N. Y., asks whether sorghum will ripen seeds in that section.

ANS.—Yes. Early Amber cane will mature seeds in Chenango county.

MANY INQUIRERS.—Seeds of Early Amber sugar-cane are sold by all seedsmen. See advertising columns. Price about $5.00 per bushel.

Various.

WHAT OTHERS SAY.

COW PEAS. We are pleased to find in the N. Y. Tribune a letter from Mr. Solon Robinson respecting the value and management of "Cow Peas" to which the RURAL NEW-YORKER has of late been giving so much attention. Mr. Robinson paid a visit to the farm of Col. Richard Peters near Calhoun, in Georgia, who, having tried to keep up the fertility of his soil with clover and all sorts of commercial fertilizers with only partial success, and not being able to make enough stable manure, and finding that sheep only fertilize the fence corners and shade trees; the question naturally was: "What next?" The important southern crop, Cow Peas, has been found in this instance more than a substitute, since it is more certain than clover and affords a greater bulk of growth to serve as manure for any other crop. The Col. led the way into a beautiful green field, covered in its whole extent with a most beautiful growth about as high as his hips.

"You have often recommended farmers to sow peas and plow in the green crop as a fertilizer; will you now tell me how to do it?" said the Colonel.

"I cannot. I acknowledge I am beat," replied Mr. Robinson.

"Then I will tell my experience, if you will tell it to others, for the benefit of the public. I was, and still am as enthusiastic as you upon the subject of keeping up the fertility of our farms with this crop, but as for plowing it in, I am skeptical. I tried that experiment last year, and failed! I am forced to the conclusion that no plow has yet been made that will plow under such vines as grew upon this farm."

"What did you do?" asked Mr. Robinson. "I understood you to say that fine wheat was grown upon the pea field. You must have managed somehow to plow under the vines."

"No, I didn't."

"What, then, did you do?"

"I said to myself something *must* be done. This is the only field I have for wheat, and I am going to sow it, and I did, and got a first-rate crop."

"Pray tell me how you did it."

"I got out the great iron roller, and the team waded through that green sea, pressing down the vines upon which this wheat was sown. The roller was followed by a large disc harrow, which rolled up some little ridges of loose earth, without moving the vines, except to press them deeper into the soil. The field was then crossed in the same manner, one team doing ten acres a day. This double harrowing, if harrowing it can be called, gave a pretty good tilth for the seed, which was covered with a heavy brush-drag. I shall serve this field in the same way. It will answer for wheat, rye and oats, but not for barley; and if for corn, I would sow rye or turnips and graze sheep and goats, which would rot the vines so they could be plowed in the spring. Now you have my experience with Cow Peas as a fertilizing crop, in which I have full faith."

"Is it a good plan to sow peas and turn in hogs?" asked Mr. Robinson.

"Yes; or poultry, a little before the pods are ripe. Sheep or goats would eat all the leaves. Swine trample them into the ground."

"You give me leave, then, to recommend Cow Peas as a fertilizer, upon your experience?"

"Yes; but don't tell people they can plow them in, unless their land is poorer than mine."

EFFECT OF GIRDLING GRAPEVINES.—The Amherst Transcript reports the following experiment: "Among the experiments with the Grapevine at Amherst Agricultural College, girdling has produced some remarkable results, both in the quantity of the fruit and the period of development. The vines were girdled about the first week in August, when the free acid of the Concord grape had reached the highest state, and the grape-sugar had begun to increase. Experiments were made with whole vines and with branches. Two incisions were made through the bark and cambium layers from one-quarter to one-third of an inch in width, and the substance between removed. The fruit on the girdled vines matured fully two weeks in advance of the ungirdled vines. Prof. Goessman picked fully matured fruit from a girdled vine at his residence fully three weeks in advance of fruit on ungirdled branches of the same vine. The vines that were girdled a year ago were in fine condition this season, and although in most instances fully healed over, the girdlings seemed to produce the same effect on the fruit as the first year."

MILK FEVER is far more prevalent than formerly, and many dairymen who formerly would have refused to buy a cow after calving, now prefer the event to be over, which they know to be frequently attended with anxiety and loss. It is easy to note the great and paramount cause of this deadly affection, by stating too much rich, stimulating, nitrogenous food before calving. . . Alderneys, Ayrshires and superior milking Short-horns are specially prone to suffer. Beef-making subjects, which are poor milkers, are rarely struck down. Animals in a state of nature, in which the milking capabilities are lightly developed, scarcely ever have milk fever; hence its comparative rarity either in America or the colonies.

GOOD QUESTIONS.—The Western Stock Journal and Farmer asks as follows:

1st. What grass is the best to feed cattle on for beef?

2d. How can the best grass be produced for that purpose?

3d. How can the grasses be utilized to the best advantage to make the most pounds of the best beef, in the shortest time, and from the youngest steers?

4th. Is it profitable to the feeder to keep his steers until they are three or four years old, if he can turn them off at two, or two and a half years old, weighing from 1,400 to 1,700 pounds?

EDUCATION ON THE FARM.—"As I look back," says 'Waldo,' in the Ohio Farmer, "over a third of a century spent on the farm, in which I have been to some extent an experimenter, I am deeply impressed with the fact that there is enough in the farmer's calling to bring into exercise the best powers of both mind and body. How erroneous is the judgment of those who suppose that mere muscle is all the farmer needs, and who think that the merchant or mechanic needs a better education than the farmer, and that their callings will develop higher traits of character than his."

PASTURING WHEAT.—If the growth in fall or early spring is too rampant and likely to be troubled with the fly, it is better to be pastured by cattle, not sheep, while the ground is solid enough to bear the weight of the animals without sinking in too deeply. Sheep, if allowed much upon the wheat, clip it too closely and may injure the crown of the plant. While we have never heard of any loss being suffered by judicious pasturing, we have no doubt that as a rule it is beneficial. The plants may tiller more, and assuredly grow up thicker and stronger and stand the storms better.—Germantown Telegraph.

THAT THE BEST REMEDY, says the The Nation, for Irish poverty is to be found in the great multiplication of peasant properties, and not by emigration, as many suppose, there is little question. Emigration is good for those who emigrate, but it leaves gaps in the home population, which are soon filled by a fresh poverty-stricken mass.

"KIEFFER'S HYBRID is of very good quality good size, deep yellow color, and orange yellow where exposed to the sun, ripening in October, and from what I have seen of it, it is a promising variety for market, as well as for family use."—So says Charles Downing in the N. Y. Tribune.

"A BLAMELESS REPUTATION is no shield against the attacks of the partisan hack who uses his pen as a poisoned arrow and fills his ink bottle with venom"—N. Y. Herald.

IF OUR LEGISLATURES and Congress were made up by a two-thirds majority of farmers, we might be able to get a little honest legislation.—Nebraska Farmer.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, JAN. 31, 1880.

SHORTLY TO APPEAR.

NOTES FROM Dr. John A. Warder, T. T. Lyon, Ellwanger & Barry, P. J. Berckmans and others respecting the true Paradise Apple as a dwarfing stock, with illustrations.

ON THE KINVER and an entirely new French Yellow Globe Mangel as sweet as a sugar beet and as productive as other mangels—illustrated.

LEGUMINOUS PLANTS—grasses and valuable fodder plants, by Professor W. J. Beal—illustrated.

STOCK NOTES by Professor E. W. Stewart, L. S. Hardin, Richard Goodman, M. C. Weld, Col. F. D. Curtis, A. B. Allen and others.

IMPORTANT ADDITION to the Rural's Seed Distribution.

SPECIAL ARTICLES from Professor S. W. Johnson, Professor F. H. Storer, Professor G. C. Caldwell, Dr. A. R. Ledoux.

A SERIES of short articles upon the cultivation of our choicest vegetables—illustrated.

DAIRY SPECIALTIES by Henry Stewart, L. S. Hardin, Professor L. B. Arnold.

FRUIT NOTES by Pres. T. T. Lyon, Gov. Furnas, Dr. T. H. Hoskins, Sec. Garfield and others.

POULTRY NOTES by Forrest K. Moreland, Henry Hales and others.

LIFE ENGRAVINGS of the Chinese Yam (Dioscorea batatas) "Cinnamon" vine; the Tulip tree and fruit &c., &c., &c.

SMALL FRUIT NOTES will be presented later by the well-known writers whose contributions have made this journal of such value in this important department of Horticulture.

TO NEW SUBSCRIBERS.

We find that many of our new subscribers have not seen our Free Plant and Seed Distribution supplement and consequently know nothing as to its terms. We will therefore send this supplement free to all who apply until further notice.

As originally announced in our Fair No. of Sept. 6, the Plant and Seed Distribution will be completed before March 1st. This for the benefit of our new subscribers.

WE can no longer supply back numbers. All subscriptions will henceforth be continued one year from the date of their receipt.

GRANTING that the Kieffer pear is of fair quality, we have no evidence that it is "blight-proof," which is the strongest point claimed for it by those who have this tree for sale. Much interest is manifested in the Kieffer all over the country—but we advise our readers to purchase rather for experiment than with any sanguine hopes of profit.

HAVING in a recent Editorial spoken reproachfully of Professor C. V. Riley, we now—in justice to him—call attention to his reply on p. 77. Following his reply is our evidence and that of the Commissioner of Agriculture in support of the statements made in the editorial alluded to. The reader should suspend judgment, however, until Professor Riley has had an opportunity of being heard from again, though we trust that any further controversy may prove short, pertinent and decisive.

WE are pleased to see that the Western Rural seems earnest in its condemnation of swindling advertisements. As it is a piece of conscientiousness that *costs* something, its readers should respect that journal accordingly. It seems to us a disgrace to this nation that so-called "respectable papers" should admit to their advertising columns (seemingly without protest from their readers), the most glaring, self-evident frauds. The disgrace is hightened by the standing editorial announcements that "Readers will do them a favor by reporting any failure of advertisers to make good their offers" and that they will "expose those who seek thus to impose upon the public." It seems odd enough that publishers should wait to learn through bamboozled readers what they already understand full well themselves.

AFTER a lapse of two-and-thirty years starving Erin once more stretches out her emaciated hands for relief towards America where so many millions of her children have in the interval found homes. It is rather unfortunate that political agitators should have tried to make an expression of America's sympathy with a starving people appear like an indorsement of their own political schemes. With the latter the great majority of the citizens of this country have little sympathy, while comparatively only a few would deem it just or expedient to promote them by financial aid; but for a suffering people America's sympathy is accustomed to come from the pocket as well as from the heart.

WE see that "Hybrid" potato seeds are offered in some catalogues for 50 cents per packet, each containing 25 or 30 seeds. Passing the fact that the seeds produced by crossing two varieties of potatoes are not "hybrid" seeds at all, it seems to us beyond all probability that if actually the result of artificial crossing, they could be produced and sold for such a price. Few potato flowers can be induced to bear fruit. It is *always* difficult to find pollen and, if we may judge by our own trials, we should not like to guarantee a single seed ball (fruit) for every day of labor. We cannot believe that seed, *known to be crossed*, could be profitably produced at one dollar for *each seed!* Perhaps those who have made a special study of this work may be able to show wherein we are wrong. We should feel obliged if they would.

THE Gardeners' Chronicle of Jan. 3, gives a list of the trees, shrubs and herbaceous plants introduced by Robert Fortune to whom the horticultural world should feel under lasting obligations. Nations are quick to recognize and to honor political or military services but very slow to recognize the services, of those who plod and toil through their lives to advance the interests of horticulture or agriculture. Many of Mr. Fortune's discoveries and introductions are to-day among the most prized plants of the ornamental grounds of our country. We may mention Spirea palmata; Lilium auratum; Prunus Japonica; Lonicera aureo-reticulata; Kerria Japonica variegata; Deutzia crenata fl. pl,; Retinospora aurea, obtusa and pisifera; Sciadopitys verticillata, many Maples; Dielytra spectabilis; Viburnum plicatum; Spiræa prunifolia fl. pl; White Wistaria; Forsythia viridissima; Akebia quinata etc., etc.

It may be some comfort to the quiet, unobtrusive Robert Fortune to know that, perchance, after his death the world may come to realize how much it owes to him and to others like him.

IN view of the continued destruction of European vineyards by the phylloxera, a great deal of transatlantic attention has lately been directed to this country as a source from which a supply of wine might be obtained. Time was, and not long ago either, when American manufactured products were held in poor estimation by the old European States. Of late years however, the rapid improvements in our methods of manufacture, coupled with a better acquaintance with our wares, has changed the world's opinion with regard to most of the goods made here; but as yet, American wines have not shared in this revulsion of opinion as much as many of our other products. At present much of the wine which is drunk here, paid for and praised as of foreign vintage never crossed salt water. From the days when the New World was serving an apprenticeship in industrial pursuits in which the Old World had already become skilled, there still remains among the American people a tendency to overestimate many European products and to underrate many of their own. The knowledge that the eyes of Europe are upon them should stimulate our vineyardists and wine-makers to produce an article that must command the approval of epicurian transatlantic connoisseurs. We advocate total abstinence; but believe the general use of pure native wines in lieu of stronger liquors a step in the right direction.

IN this State 600 cattle are now in quarantine on account of pleuro-pneumonia. Already $16,000 have been spent in checking the plague, and last Wednesday $30,000 more were asked of the Legislature to pay past debts and for immediate expenses. With praiseworthy wisdom and alacrity, the full appropriation was promptly made unanimously in executive session. At the same time a concurrent resolution was introduced in both Houses calling upon Congress to legislate for the suppression, by the National Government, of this standing threat to the vast cattle interests of the country. We have frequently insisted on the necessity of speedy legislation in this direction. The whole country is deeply interested in the eradication of this plague from the very few spots in which it still retains a foot-hold. Some of the Western papers have now and then expressed the opinion that its extirpation is a work for which the Eastern States exclusively should provide and pay. When a building is on fire and the fine neighboring mansions are threatened with a ruinous conflagration, it is certainly not a mark of wisdom on the part of the owners to confine their efforts to urging the proprietor of the burning structure to increased endeavors to extinguish the flames. The quota of the States which are free from the pestilence towards its suppression in less fortunate States, would be but a small premium on the insurance of their own herds against possible contagion.

NOTWITHSTANDING the fine crops that during the past year blessed the West as a whole with abundance and returning prosperity, certain parts of it, especially along the frontier, are at present sadly pinched. Early in the week Gov. St. John, of Kansas, telegraphed Jay Gould that great destitution prevailed among the farmers of the frontier counties of that State, especially those of Sheridan, Grove and Wallace counties, owing to the failure of crops through drought last year. Gould telegraphed a remittance of $5,000, for which a couple of car-loads of flour and meal as well as a large supply of bacon were promptly forwarded as an immediate installment. Frequently during the past year Kansas contributors to "Everywhere" have warned intending immigrants to that State, of the imprudence of going too far west. The present distress is by no means a novel experience, however, as it has frequently happened that that State has had to save recent settlers from starvation in frontier places owing to shortage or entire failure of crops. Experience seems to demonstrate that the immigrant to the Far West, with a family dependant upon him, should have capital enough not only to build some sort of a home and plant the first season's crops, but also to bridge over the second should the crops of the first prove failures. In a thinly settled country little help can be expected from distant neighbors all equally pinched, while work whose wages might eke out a short harvest, is hard to find and poorly paid.

THE CORNER IN WHEAT.

GREAT was the excitement last Saturday among the grain dealers at the Produce Exchange in this city. Wheat suddenly dropped from three to five cents per bushel; reports from various points in the West announced a fall there also; rumors flew thick and fast of failures among the brokers, of weakening of some of the wheat syndicate, and of the speedy collapse of their "corner." The "bears" were jubilant, the "bulls" despondent, but although many were squeezed tightly, not more than one or two of the regular dealers were crippled; but a large number of "outsiders" operating on "margins," are said to have lost everything.

For the last three or four weeks the price of wheat has been steadily declining, with a pretty sharp fall last week, as noted in our Market Reports. The syndicate, who since last fall have been the chief purchasers of wheat all over the country but especially in the West, cannot, however, afford to allow prices to go down in view of the enormous quantities they have on hand, some of which they purchased at higher figures than those now ruling, while the cost of all of it has been considerably increased by shrinkage, vermin and storage since it came into their hands. Just at present however, the outlook for them is not very bright. European advices seem to indicate a firm resolution on the part of dealers there not to purchase our wheat until the prices shall be satisfactory to them. Rather than pay heavily for wheaten bread, there will be a great substitution of other foods for the "staff of life," while British India, Australia and New Zealand are looked to for large supplies of wheat. Consequently, despite the late decline in wheat here, prices in Liverpool to-day are lower than in New York. This has been the chief cause of the great shrinkage in our wheat exports for a considerable time. In this port there are to-day about 250 vessels waiting for grain cargoes which cannot be had at any paying rate of freight, while the ports of Boston, Philadelphia, Baltimore and San Francisco have each large expectant fleets. Grain is accumulating enormously in the West, owing to the rise in railroad freight immediately on the removal of competition by the closing of the canals. A few months ago the charge from Chicago to New York was two dollars per ton; now it is eight dollars. Hence on the 19th inst. the stock of all kinds of grain at Montreal, Boston, New York, Philadelphia and Baltimore amounted only to 16,402,187 bushels, including 11,133,899 bushels of wheat and 2,322,628 bushels of corn.

But there is altogether in the country at present an estimated surplus of 86,000,000 bushels. The wheat crop for 1879 is put down by the statistician of the Produce Exchange here at 448,000,000 bushels. Of this the consumption for manufacturing purposes, seed and food is about 250,000,000 bushels, leaving 198,000,000 bushels for export. From July 1 to December 31, the export was about 127,000,000 bushels, including an estimated remnant of about 15,000,000 of the crop of 1878. Deducting this from the total export, there are left 112,000,000 belonging to last year's crop, of which this surplus of 86,000,000 bushels is yet available for export. Certainly not more than from 15,000,000 to 20,000,000 of this still remains in the hands of the farmers, and of the remainder the whole must be in the hands of dealers and by far the larger portion under the control of the syndicate.

It will be seen, therefore, that until the next harvest shall have come into market, the price of wheat will have comparatively little effect upon the farmers of the country, though it may "make" or ruin hundreds of speculators. What it shall be will depend upon the issue of the struggle between the greed of these and the need of Europe, but meanwhile, the entire population of this country also, are economically interested in it, inasmuch as the cost of their loaves and hot rolls will depend upon the outcome. The members of the syndicate are all very wealthy men; they can command vast capital besides; they are, most of them, bold and resolute speculators; there is little doubt but that before next harvest there will be a market for all their grain at their own figures, if they persevere; their profits if triumphant will be enormous; their losses, if defeated, will not be small; a persistent struggle may therefore be anticipated, unless the weakening of some of them shall cause a speedy collapse of the "corner."

BREVITIES.

WE fear we shall not hear as much from our friend Mr. J. B. Armstrong as formerly. He is now the Editor of the Daily Republican of Santa Rosa, Cal. a copy of which (vol. 1. no. 10) is now before us. We wish him success. He has talent enough to command it.

MR. Charles Darwin publishes in Nature, a case in which hybrid birds, the offspring of two distinct species, have proven fertile *inter se*. The common goose and the Chinese goose are so distinct that they have been placed in different genera. But they interbreed and their offspring are fertile. Sterility, consequently, is thus shown to be no safe criterion of specific difference.

AT the Fair of the Wisconsin Dairymen's Association at Elkhorn, on January 14 and 15, the silver cup, value $25, offered as a premium by the RURAL NEW-YORKER for the "Best Cheese made at any time," was awarded to W. S. Baker, (Merrick's Factory,) Cold Spring. A similar cup of the same value offered by the same paper for the "Best Butter made at any time," was at the same time adjudged to L. Lytle, Elkhorn—both first premiums.

AT the late meeting of the New Jersey Horticultural Society, Mr. P. T. Quinn stated that the Chinese Sand Pear had blighted on his place. As this Pear has heretofore been considered blight-proof, and by reason of this quality, has been highly recommended for stocks, this revelation is of much interest. Though it may withstand the disease better than other varieties, the fact that it has once blighted, is evidence that it may do so again, and the appellation "blight-proof" as applied to it, will hereafter be a misnomer.

OUR new friend, Land and Home, complains that the Mass. Ploughman appropriated one of its articles by Prof. James Law, an advance proof of which was sent to the Ploughman, so that it might appear in both papers the same week. "This is the way they return our courtesy," says the Editor. "Courtesy," is that the word? The Ploughman merely accepted that which was presented and failed to say "Thank you" in *public*. Perhaps the Ploughman was grateful at heart. Land and Home was in a sort of inexplicable humor last week. It tells its readers how it blundered in bestowing a wrong name upon Mr. Crozier's bull and then soothes itself by saying that the RURAL NEW-YORKER made a greater blunder over the Hereford bull which we illustrated in our issue of Jan. 10. We hoped that our slip would pass unnoticed; but we wish to be "courteous" and are not unwilling to aid our young friend in giving it publicity.

A LETTER FROM PROFESSOR C. V. RILEY.

TO THE EDITOR OF THE RURAL NEW-YORKER:

Sir :—I find the following statements in an editorial in the issue of Jan. 8th of your journal :—

[1] Professor C. V. Riley sought the position of Entomologist to the Agricultural Department. [2] He solicited the press to pronounce upon his fitness for that position. [3] He was appointed and—resigned. [4] Probably he was surprised that the resignation was promptly accepted, for he exerted his best influence to get back. [5] Then he commenced and has since industriously continued his denunciations of the Department which, even if well founded, come from him, under such circumstances, with an exceedingly bad grace.

The third statement is true. I pronounce each and every one of the others most false and unwarranted. [1] The position of entomologist to the Department was tendered me after various consultations and some correspondence with the Commissioner, and I was a candidate merely as others were after the public announcement of Prof. Glover's ill health and necessary withdrawal. [2] In accordance with custom, I solicited some dozen of the leading naturalists of the country to pronounce upon my fitness for the position, but not a word was solicited from the press. [4] I was *not* surprised at the acceptance of my resignation, because said resignation was deliberate, for good reasons, and emphatic, and I twice declined to extend the time when it should take effect. Instead of exerting my influence to get back, I dissuaded those who expressed the wish to have me back from making any attempt to bring about that end. [5] I have said nothing of the Department since my resignation that I had not said before, or during my connection with it, nor written anything regarding it except the paper read at the organization of the American Agricultural Association. Said paper, while fearlessly criticizing, was really a plea for the advancement of agriculture in this country, and for the re-organization of the Department on a broader and more useful basis. It was without personality, indorsed by members of the Society, and unanimously ordered printed.

I am unwilling to let pass unnoticed such slanderous statements in an old-established journal for which I have always had respect, and unless they were made from sheer malice, you have been misled by others, and will retract. Respectfully,

Washington, D. C., Jan. 12, 1880. C. V. RILEY.

REPLY.

We could hardly feel malice towards one who, so far as we know, has never harmed us in any way or sought to do so. But if it were otherwise, we should feel that it would be far from manly, were we to suffer our personal dislike to show itself in the columns of our own journal. To our way of thinking, the Department of Agriculture under Gen. Le Duc, has displayed energy and a manifest desire to benefit the interests of agriculture. Whether it has measurably succeeded or not, the effort and the desire to do so should have shielded it from the vulgar gibes and reproaches that have been showered upon it by those who could have had no benevolent motive in so doing. When, therefore, any person holding the high position that Professor Riley occupies as an entomologist, first seeks an office in the Department of Agriculture and then, having become displeased with its Chief, endeavors to be replaced after an ill-considered resignation, and, failing in this, denounces both the Department and its Commissioner, we assume that it is the business of the press in general, and of the agricultural press in particular, to show wherein such reflections are without foundation in fact.

Professor Riley pronounces "each and every one" of our statements as "most false"—except the unimportant one that "he was appointed and resigned." First, therefore, the statement (1) that he sought the position is "most false," and second, the statement (2) that he "solicited the press to pronounce upon his fitness for that position" is likewise "most false."

We have the proof that, about a month previous to his appointment, he wrote a letter over his own signature requesting the "Editor of the RURAL NEW-YORKER," to pronounce upon his fitness for the position of Entomologist to the Department of Agriculture, in view of his name having been mentioned in that connection.

In consideration of the fact that a number of the more influential agricultural journals did at that time, as if by one accord, express *their* opinions respecting his fitness for the position, we naturally concluded that the same request had been made of those journals. Of this, however, we have no further proof than the above bit of circumstantial evidence, somewhat strengthened, perhaps, by the fact that as we had no personal acquaintance with Prof. Riley, he was as likely to have made the request of other journals as of ours. The fact remains, all the same, that he *did* make the request of us, and that therefore he did solicit a public expression of opinion "from the press" as to his fitness for the position. The third statement is not questioned. We respect Professor Riley's unwillingness to pass unnoticed any slanderous statements from reputable sources. As they were *not* in the present case made from "sheer malice," or from any malice whatsoever, if we have been "misled" as to the fourth and fifth statements, we shall gladly and fully "retract" them. On the other hand, Professor Riley is thus far called upon to admit that our first and second statements are not "most false," but absolutely true.

Statements, Letters, Short-hand Reports of Conversations, &c., from the Commissioner of Agriculture.

DEPARTMENT OF AGRICULTURE, WASHINGTON, D. C., Jan. 15th, 1880.

EDS. RURAL NEW-YORKER:—Your understanding of my verbal statement that Prof. Riley tried to retain his position in the Department after his resignation had been accepted, is correct, as the following extracts from certain letters, and from his conversation, taken down at the time in shorthand, will show. Prof. Riley's resignation was dated March 29th, 1879, and was as follows:

"Unwilling to incur further risk of being treated discourteously whenever I make any suggestion for the benefit of my Division, and satisfied that under present circumstances I cannot longer remain Entomologist of this Department and retain my self-respect, I hereby tender my resignation."

This resignation was accepted in the following words:

"I have the honor to acknowledge the receipt of your communication of date March 29th, tendering your resignation of the position of Entomologist of the Department.

Passing without criticism the offensive manner and style of your communication, and looking to the good and harmony of the Department, your resignation is hereby accepted without comment, to take effect April 30th, A. D., 1879."

About this time I had occasion to be absent from the Department, and on my return I learned that the Baltimore Gazette, had published the following article written by its correspondent here, Mr. Butler, whom at that time I had never seen:—

"Several weeks ago Professor Riley, Entomologist of the Agricultural Department and former State Geologist of Missouri, sent in his resignation to Commissioner Le Duc. In a conversation to-day Prof. Riley made certain statements that will be likely to lead to a Congressional investigation. He remarked that he did not care so much about the personal affronts shown him by Le Duc, but he did object to the latter assuming everything connected with his special Department. Furthermore, he charges and stands prepared to prove that Mr. LeDuc has misappropriated funds set apart for the Commission appointed to investigate the ravages of the cotton-worm in the South. The Professor says that this fund is so drawn upon that he could not operate with any success. It was used in clerk hire, and he knows that a draughtsman sent out to Minnesota to make plans for a new house for Le Duc, was paid from this appropriation.

The Commissioner is about to have an interesting investigation on his hands. It will be remembered that some time since the charge was publicly made that Le Duc had misappropriated the fund for seeds. This, it is alleged, can be proved. It amounts to thousands of dollars. Since the resignation of Prof. Riley the place he vacated has been offered by Le Duc to Prof. Cyrus Thomas of Ills., but that gentleman has written a caustic letter of refusal to the Commissioner, giving 'Under the circumstances' as his reason."

This article was crowded into papers all over the United States north and south, with such variations here and there as the editors of the different papers chose to make. I call your attention to this, and especially to the latter part, that you may compare it with the statements of Prof. Thomas and Mr. Brisbin Walker (and no one acquainted with either of these gentlemen will question their veracity). You will notice that the paragraph states that Prof. Thomas "had written a caustic letter of refusal" giving "Under the circumstances" as his reason. But the words in quotation were used in this connection to convey the meaning that "under the circumstances" meant the dismissal of Riley. A copy of the letter in which Prof. Thomas accepts the position tendered him, will be incorporated in this letter, that you may judge of the motive that would prompt the desire to circulate such a falsehood.

I sent for Mr. Riley, called his attention to the article, and the following is a short-hand report of our conversation at that time:

Commissioner.—"The Chief Clerk was telling me this morning something in relation to a newspaper article which I have not yet seen. What is there of it?"

Riley.—"I am very much annoyed at the way the thing has been mentioned. I tried to avoid it. A stranger to me came up to my house and wanted to get some points. I told him I had nothing further to tell him. I told him what the result of the resignation was. To my surprise a paragraph appeared which I would not have had for anything I have studiously avoided—"

Commissioner (interrupting).—"What was the paragraph?"

Riley.—"Simply went on to state that Prof. Riley had resigned, the former geologist—he had it—of Missouri, and a lot of other erroneous ideas and even went at the Department."

Commissioner.—"Were there some specific charges of dishonesty."

Riley.—"Something in regard to seed."

Commissioner.—"What was there about the drawings that I employed a man to do for me?"

Riley.—"It made reference to your employing some one to go to Minnesota to make drawings."

Commissioner.—"You made no reference to it in your conversation?"

Riley.—"No, sir."

Commissioner.—"What are the facts as you understand them?"

Riley.—"I presume Mr. Butler has been feeling sore. He has made repeated charges and references to the Department, and took advantage of my resignation to come up there and lug my name in. Those are the facts. * * * * I detest the way newspapers take advantage of every opportunity to make news. This man is simply repeating what he has said before. * * * * This man, Mr. Butler, was sent up as a representative of the Baltimore Gazette. This man was sent up by Mr. Jones. I was in my office at the time. I just told him I had nothing whatever to say in regard to the matter."

Commissioner.—"Then the information came through Jones?"

Riley.—"Yes; he told me he had been sent by Jones."

The day following this conversation my attention was called to the charge of implied dishonesty by the then editor of "The Republic", Mr Brisbin Walker, who asked me if I wished to make the denial public. I advised Mr. Walker to call and interview Prof. Riley, as I did not believe that gentleman had ever authorized its publication. This interview was held and a report of it appeared in the "Republic" of April 13th, and is as follows: "Finding in the Courier-Journal of Wednesday, what purported to be an interview with Prof. Riley, late Entomologist of the Agricultural Department, in which serious charges were made against General Le Duc, I took the trouble to call on Prof. Riley and show him the report. After reading it through carefully, he exclaimed emphatically: 'This is an outrage. It is wholly made up, and no such interview ever took place.' In the course of further conversation he stated that he believed the interview to have been concocted for the purpose of injuring Gen. Le Duc. It is difficult to estimate just what punishment a man deserves who will deliberately manufacture falsehoods against a Government official and send them broadcast by the telegraph. This is not the first time that an effort has been made to injure the standing of the Commissioner of Agriculture by the dissemination of malicious rumors; nor is it the first time that falsehoods have recoiled to the discomfiture of the originators."

On April 29th, Mr. Butler, correspondent of the Baltimore Gazette, called at my office and the following stenographic report of his conversation explains itself:

Mr. Butler.—"General, about ten days or two weeks ago I went up one day and had a talk with Prof. Riley. He made some statements to me and I understand lately through Western men and several friends that he says he did not make them at all. I say that he did make those statements. * * * If Mr. Riley wants to kick against any statement I made, I will face him in a minute. There were a great many things he did say I did not use. He made several broad statements * * * How did I know of it if he did not tell me?"

I will now quote from a conversation held with Mr. Riley on the afternoon of April 29th. * * * *

Commissioner.—* * * When charges are made by a man who, as he says, gets his authority from you and gets not only what he published but more, and from you, I have a right to believe it."

Riley.—"When you have the first reason to doubt my honor and integrity you have; but I have tried to keep out of this, and I will face any man who says I have had anything to do with all this unpleasantness."

Commissioner.—"I will send for the newspaper man to come here to-morrow, and we will see what he has to say about this matter. He has either to say what he has told me or he has to confess that he has lied to my face."

Mr. Butler could not come the next day, but made his appearance May 1st, accompanied by a fellow reporter, Mr. W. P. Copeland. The following is a short-hand report of what occurred. Mr. Butler called to meet Prof. Riley, who had made arrangements to meet him at two o'clock, but was at that hour absent.

Mr. Butler.—"I want to meet him and have this thing settled right up here and now. I don't flinch a hair, you know."

Commissioner.—"He said he would be here at two and have his witnesses."

Butler.—"Well, there were no witnesses to it."

Copeland.—"I waited nearly an hour in front of Riley's house while Mr. Butler was in there. When he came out he told me what Riley had said."

The Commissioner referred to Mr. Riley's denial of the Walker interview.

Mr. Butler.—"Yes, he is trying to craw-fish on that, too."

I give you these quotations from my short-hand reports upon this matter, that you may better judge of the character of a person who would seek to retain a position in the Department after all this had passed. I will further quote for your information from a short-hand report of April 29th, the same being an answer to your query whether Riley did or did not try to remain in the Department after his resignation and after furnishing the newspaper paragraph to Butler.

Mr. Riley.—"I called at your house on Tuesday evening. I have had two letters from Thomas saying that the position had been tendered to him and that he had declined it. I thought under the circumstances I would see you and find out whether you still desire me to leave or whether you felt convinced I had no finger in that legislation. I wanted to know definitely about the matter. I should like to finish this investigation, and if I stay I have certain places where I would very much like to visit. * * * * I felt that if Thomas did not accept there might be still a chance of your letting me continue. * * * I am willing to admit that I sent in the resignation hurriedly, but I thought you had something against me. Your manner showed it."

Commissioner.—"You seemed anxious to make your resignation, and even when you were advised to delay, the Chief Clerk tells me you said 'No, you would not do it.'"

Riley.—"Of course, I am willing to admit I was hasty. * * * * Now, if Thomas comes here I would like to know just when he comes, and I would like, if possible, to make some arrangements to complete that Cotton Commission. If there is a way of my remaining with you, if you are convinced that I am not the cause of this legislation."—"I would like to do so"—is what he said; finishing the sentence. The short-hand writer did not get it down, as you see by —. He lost a little and had to commence with:—"I know Thomas is in this position:—He throws up his place at $3,000 and a position on the Commission. He is in a far better position than I am. He has expressed an unwillingness to go into Department life. * * * * I feel satisfied that if Thomas knew all the circumstances he would be perfectly satisfied."

Commissioner.—"If he does not accept it, there is another party who stands ready to take it."

Riley.—"Well, I had hoped that some arrangement could be had, but this will end the matter for the present."

In this connection I now incorporate the letters heretofore referred to. Under date of April 2nd Prof. Cyrus Thomas writes:

CARBONDALE, Jackson Co., Ill., April 2nd, 1879.

HON. W. G. LE DUC—*Commissioner of Agriculture.—Dear Sir:*—The position of Entomologist to the Agricultural Department is a very desirable one, and one which I would gladly accept under most circumstances, but do not see how I can do so this year consistently with my own interest.

If I understand correctly, the salary is only $1,800 or $2 000. With the family I have, this would hardly support me in Washington. The salary of State Entomologist of Illinois, which office I now hold, is $2.000; hence there is no pecuniary advantage to be gained by changing. You are also fully aware of the expense and trouble of breaking up and moving a family the distance I would have to go.

The position you offer is one in which an Entomologist may gain great reputation, and hence is to be desired on that account; but my first duty is to my family, and the salary, if what I understand it to be, would not justify me in making the change.

Thanking you for the kind offer made, I must decline accepting, for the reasons given. Very respectfully, CYRUS THOMAS

This is the letter upon which the press commented so severely, giving "Under the circumstances" as the reason for his declination. This confidential communication found its way to the public through the press and telegraph, but with the wording and spirit so garbled as to show an evident intention and desire to have pending negotiations looking to the appointment of Thomas suspended, and also that it might, as far as possible, call down on the Commissioner the censure of that portion of the newspaper press which has so long been used for the furtherance of Mr. Riley's purposes. Meanwhile he wrote to Prof. Thomas requesting him as a friend to write me and try to correct what he (Riley) thought was an erroneous impression; *i. e.*, to help him to get back into the Department.

Mr. Cowing, of this Department, had suggested that he might go back if he obtained letters from parties certifying that he had nothing to do with certain legislation—as will be seen from Cowing's letter inclosed. Riley obtained several letters on this point and presented them, but I did not think it prudent or profitable for the Department to reinstate him.

By means not necessary to be explained here, the Appropriation Bill did not provide the additional thousand compensation to the Entomologist, and hence Prof. Thomas addressed me the following letter on April 17th.

CARBONDALE, April 17th, 1879.

HON. W. G. LEDUC, *Commissioner of Agriculture—Dear Sir:*—Having examined the Bill making appropriations for your Department, and having more fully considered the offer you so kindly made me, I have decided to recall my acceptance. I do not see under the present condition of the Appropriation Bill how I am to obtain the salary mentioned, as the provisions are very strict and I cannot afford to leave Illinois and go to Washington for $1,900.

I think you and I could work together harmoniously and the position is a desirable one, but until Congress will make a proper allowance for the position, I cannot agree to take it. My acceptance was based on the proposition as to salary, but I do not see how it can now be carried out, and as I do not want to make a change on uncertainty, I must withdraw my acceptance. But allow me to thank you for your flattering offer, and to state that I will at any time I can, wield any influence I may have for the benefit of your Department. * *

Very truly yours, CYRUS THOMAS.

[The above letter has reference to another letter not published.—EDS.]

After Prof. Thomas had declined, I tendered the position to Prof. Comstock, the present Entomologist. It was, you know, accepted, and I have every reason to congratulate the Department and the country thereon. While all this was progressing, letters from various persons were received, evidently at the instance of Prof. Riley, to secure his reinstatement in the Department. These facts will, I think, sustain the statement that Prof. Riley industriously tried to get back into the Department after he had resigned.

WM. G. LEDUC.

DEPARTMENT OF AGRICULTURE, WASHINGTON, D. C., Jan. 16th, 1880.

W. J. COWING—*Dear Sir:*—In a conversation I had with an editor of a paper, I remarked that Riley tried to get back in the Department after he had resigned. If you have any knowledge upon this subject have the kindness to put it in writing and send it to me at your very earliest convenience. Very respectfully yours,

WM. G. LEDUC, Commissioner.

DEPARTMENT OF AGRICULTURE, WASHINGTON, D. C., Jan. 16, 1880.

HON. W. G. LE DUC—*Commissioner of Agriculture.—Sir.*—In reply to your favor of this date, I would state that I learned a day or two after Professor Riley tendered his resignation, either through Prof. Riley or Gen. Carman, Chief clerk of the Department, or perhaps both, that the difficulty between the first named gentleman and yourself had grown out of some interference with legislation for the Department. As Prof. Riley disclaimed any such interference, I remarked that if such fact was shown to the satisfaction of the Commissioner, I thought it would result in an amicable settlement of the misunderstanding, and that his resignation might be withdrawn. My recollection is that Prof. Riley acted upon this suggestion.

Yours, very respectfully, W. J. COWING.

DEPARTMENT OF AGRICULTURE, WASHINGTON, D. C., Jan. 16, 1880.

HON. W. G. LE DUC—*Commissioner of Agriculture.—Dear Sir:*—My recollections of the circumstances attending the resignation of Prof. Riley are as follows: some time in April Prof. Riley informed me that on the preceding day he had a conversation with you, in which your tone and conversation were so severe and marked that his self-respect would not allow him longer to remain in the Department. He then handed me his resignation which I returned, informing him that I thought his action hasty and ill-advised and advising him to withhold the same until he had thought more of the matter. He thought favorably of my suggestion, and I thought acted upon it, but the next morning I heard he had handed it in to you. Some days later he seemed to have obtained the impression, that if some matter relating to his efforts to obtain special legislation were explained to your satisfaction, the resignation might be withdrawn. I then told him that it was too late, that his hasty action in the first place, coupled with some unfortunate newspaper articles had put it beyond my province to do anything in the matter. Prof. Riley was anxious that the differences should be accommodated and he remain in the Department, a fact which is strengthened in my mind by the remark he made to me in New York in December last "that he had always had the impression that had I interfered more actively in his behalf, the matter might have been arranged."

Very respectfully

E. A. , Chief Clerk.

Literary Miscellany.

THE MODEL SUBSCRIBER.

WILL CARLETON.

"Good morning, sir, Mr. Editor, how are the folks to-day?
I owe you for next year's paper—I thought I'd come in and pay;
And Jones is going to take it, and this is his money here;
I shut down tendin' it to him, and then coaxed him to try it a year.

"And here's a few little items that happened last week in our town;
I thought they'd look good for the paper, so I just jotted 'em down;
And here is a basket of peaches my wife picked expressly for you,
And a small bunch of flowers from Jennie—she thought she must send something, too.

"You're doing the politics bully, as all of our family agree;
Just keep your old goose quill a flappin' and give them a good one for me
And now you are chock-full of business, and I won't be takin' your time;
I've things of my own I must tend to—good day, sir; I believe I will climb."

The editor sat down in his sanctum, and brought down his fist with a thump:
"God bless that old farmer," he muttered, "He's a regular jolly old trump,"
And 'tis thus with our noble profession, and thus it will ever be still;
There are some who appreciate its labors, and some who perhaps never will.

But in the great time that is coming, when Gabriel's trumpet shall sound,
And they who have labored and rested shall come from the quivering ground:
When they who have striven and suffered to teach and ennoble the race,
Shall march at the end of the column, each in his God-given place—
As they march through the gates of the city with proud and victorious tread,
The editor and his assistants will travel not far from the head.

WILFUL'S CHRISTMAS EVE.

CHAPTER I.

AT KING'S CROSS.

"Train to York, sir? Yes, sir; starts in ten minutes See to the luggage, sir? Yes, sir; directly."

"Due in ten minutes, is it? I was in hopes it was gone," muttered the elderly gentleman who had questioned the porter; and then he drew his scarf up to his ears, shivered in spite of his thick Ulster, and remonstrated peevishly with the lady who leaned on his arm.

"There is a train, as you hear, but it is impossible that you can reach Froyle Priory before midnight. And the weather is frightful! the papers are full of reports of heavy snow-storms, and the cold is intense, and ——"

But here he was interrupted by the lady, who drew herself up with a dogged look on her well-preserved features

"Did you ever know me to permit the mere accident of weather to interfere with my duty?"

"Why, what on earth ——" Mr. Lockwood began fratedly, then checked himself with a hopeless gesture, as if he knew all further arguments would be thrown away on this Spartan matron

But as he turned from her, his eyes fell on two young ladies who had silently followed her on to the platform; the one a fair, placid, sleepy-eyed blonde; the other a vivacious mignonne brunette, and he ventured another remonstrance.

"You must not forget the girls, my dear"

"Forget them!" his spouse coolly repeated, "They are here, are they not?"

"Yes, yes, that's what I mean; it is not prudent—Is it? to expose them—colds and coughs, you know—and Gertie, bless her! has just had a touch of neuralgia, and Lelia so far from strong."

"I am not at all strong myself," said Mrs. Lockwood, deliberately. "This hurried journey may lay me up, but no personal considerations shall deter me from doing what I know to be right."

"Now, really, my dear, you are taking an exaggerated view of your responsibilities," her spouse began.

"But really, Mr. Lockwood, you are keeping me standing in a draught. May I not take my seat, or do you intend to forbid my going to the Priory?"

"Forbid it!" and Mr. Lockwood looked aghast at the idea of exerting his authority. "No, no, Maria, you must do as you like; you always do," he added, ruefully; "and I don't suppose it's any use asking why, after agreeing to our spending Christmas quietly at my son's house at Sydenham we are suddenly marched off to the other end of Yorkshire."

"You raised no objection when I accepted the invitation of General and Mrs. Froyle," he was tartly reminded.

"I am aware of that; in fact, I don't think I ever do oppose your plans, my dear, but I did not wish to go to the Priory, and I'm sure I was heartily glad when you told me it was our duty to stay at home, and not expose Lelia to the inclemency of a Northern winter. You certainly did say so," he persisted, as she made another attempt to interrupt him. "Yet here we are, starting for the General's at the shortest notice, and so late in the day, that we shan't reach his house before midnight! Just fancy riding over those bleak moors, with a wind blustering round us that freezes the blood in our veins Ugh!"

"I thought," cried the lady, tartly," I thought I made you understand—I am sure I tried to do so—that you need not accompany us unless you choose."

"I don't see much choice in it," was the reply; "but here's the train. Where's Gertie? Where's Lelia?"

"We are here, sir," said Mrs. Lockwood's ward, Lelie Darton, tripping towards him; "but don't trouble yourself on our account. I'll take care of Ger," and she stood on tiptoe and nodded patronizingly at her tall friend. "You've quite enough to do without looking after us."

This was true, for that much-tried gentleman, harassed on one side by his lady, on the other by her maid, an elderly spinster who was out of humor at this sudden journey, was in a state of utter bewilderment by the time the impatient guard hustled him into the carriage, where Mrs. Lockwood was already comfortably seated, and audibly wondering he could not have managed the luggage and the tickets better. He would have defended himself, but was severely informed that her head was aching intolerably; and thus snubbed, he settled himself in a corner and went to sleep, an example which Mrs. Lockwood, in spite of her sufferings, very soon followed.

As soon as her regular breathing proclaimed the fact, the young ladies exchanged glances.

"Pleasant this, isn't it?" queried the tall, fair Gertrude. "Three hours ago I was snugly seated over the fire, thinking how nice it would be to spend Christmas at my brother John's, and pet my baby-neices, and here I am—cold and cross—my wardrobe bundled into my trunks anyhow—more than half my toilet essentials left behind, and all my ideas in a state of confusion. Will any one tell me why? What has happened? My dear, very dear stepmother, often does inexplicable things, but this is the most inexplicable of all!"

"Scold me for it?" answered Lelia Darton, crossing her arms on her bosom, and putting on as penitent an air as her sparkling brunette features could adopt. "Yes, scold me; it's all my fault! No, not my fault; my misfortune! If I had been born dumb, what a dear girl I should have been! But, alas! the gift of speech has been a fatal one to me—unhappy, ill-fated me!"

"Don't stop! I like to hear you rave a little, it's so amusing!" said Gertrude, tranquilly. "Only, when you've quite finished, favor me with an explanation, for I'm not quick-witted enough to find one myself."

Lelia flung her sealskin muff at her friend, who slipped her own hands into it, and leaned back in an easy attitude, asking, nonchalantly:

"Well?"

"Don't tease, Gertie! I really am very unhappy."

"Shall I weep with you?" inquired Miss Lockwood, feeling for her handkerchief. "I shall be most happy!"

"No; but you might be serious when you see that I am in earnest," Lelia excitedly retorted. "Have you not troubled yourself to wonder why we are hurried off from town in this manner? But no, you never do trouble yourself about anything! You are the coolest, most indifferent creature, that ever existed!"

"*Merci!* You are complimentary!" replied her friend. "I rather think I commenced the conversation by demanding a reason for this hasty move. If it hasn't surprised me very much, it is because my feelings have become blunted since papa married Major Reif's widow, and I have lived with that excellent female and her ward. Ice on one side of me, fire on the other, have reduced me to a nonentity."

"It's you who are complimentary now!" cried Lelia, with a laugh; and then she leaned forward to give Miss Lockwood a loving caress, and exclaim: "How cruel I was not to see that you have tears in your eyes—not to divine that you must be grievously disappointed at being dragged away, just as you had reckoned on spending a few happy days with your brother! Dearest Gertie, forgive me!"

"Is there anything to forgive, little wilful?" Gertrude demanded, as she returns the affectionate hug. "Why are you accusing yourself? Is it your fault that mamma has suddenly repented the good nature with which she acceded to papa's wish to go to John's for the holidays?"

"Yes, it is all my doings. If I could but have held my tongue a little longer, or fibbed more readily, or if that wretched Viscount Alleyne would but have died in his infancy, or married some one else—as he ought to have done when he came of age—I should have escaped this vexation!"

"What a mysterious speech! Has it a beginning or an ending? What *have* you done, you dreadful young woman?"

"Don't I tell you? I talked when I should have been silent, and spoke frankly when I should have diplomatised."

"Thanks for the explanation. It's a very lucid one. I understand just as much as I did before!" said Gertrude, quizzically.

"Patience, dear! I'm coming to it," replied Lelia. "You know that ever since the death of my parents consigned me to Mrs. Reif's—I beg her pardon, Mrs. Lockwood's—care, she has been engaged in a continual struggle to model me into a girl after her own heart——"

"Query, has she a heart?" murmured Gertrude.

"She has considered it her duty to make me an accomplished automaton, and I need not tell you that she has failed I'm sure she has to me!"

"Never mind," said Gertie. "I like you best as you are. But do go on, or we shall reach our journey's end before I learn why we are on the wing for the house of your father's old friend, the General"

"Here's the reason, then. When Viscount Alleyne and I were children, our parents used to discuss the idea of a marriage between us, because our estates join. I had forgotten this till Mrs. Lockwood reminded me of it. Of course, she considers it her duty—how I hate that word! to carry out their half-formed plan, and she decided to stay in London, because she heard that his lordship, who has been *attache* at St. Petersburg, had returned to England, and would spend some weeks in town."

"It begins to grow interesting," said Gertie; sitting up. "A live lord, young, handsome, and rich. Can the dear mamma be cruel enough to hurry you away from such a prize?"

"A prize, indeed! Why, he was a hateful boy. We were always quarrelling," pouted Lelia. "I did not wish to see him again; and when I discovered that General Froyle had invited him to meet us at the Priory, I was delighted to find that Mrs. Lockwood had declined the invitation. While she loitered in London waiting for him, he would have time to fall in love with some Northern beauty. All would have gone well, and I should have escaped the humiliation of being thrown at his head, if I had not triumphed over her too soon."

Gertie regarded the pretty speaker inquiringly.

"Yes, Mrs. Lockwood lamented this morning that, in spite of her efforts, I was so totally unfitted to shine in society, that she feared Lord Alleyne would scarcely care to wed me; and I could not resist telling her we were not likely to meet at all, as he would spend his Christmas holidays at the General's. You know the consequence. I had spoken too soon; in three minutes she had telegraphed to Mrs. Froyle, and I was sent to the right about to get ready for this journey."

"Oh, poor Lelia! Are you destined to be a viscountess in spite of yourself?"

The dark eyes flashed angrily.

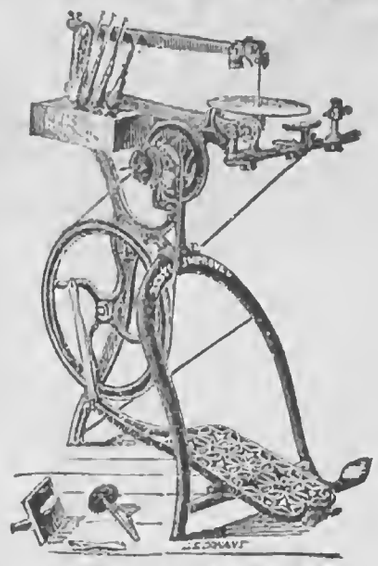
"Is it at all probable? Has not Mrs. Lockwood's assertion that it is her duty to get me well married been sufficient to rouse all my womanly feelings in arms against her?"

"Don't be too wilful, Lelia. If the young man is all he ought to be—"

"What has that to do with it?" asked Lelia, impetuously. "I have too much self-respect to be offered for sale. I refuse to consent to such degradation. Do you think I could endure to stand by and hear him reminded that our parents thought it would be a good match, and that my property will be a nice addition to his, only he must take me along with it? I tell you I'll not submit to it!"
—To be continued.

THE LESTER SAW.

This saw is offered as premium No. 96 in our premium list. The "Lester" is made by the Miller's Falls Co., office, 74 Chambers St., N. Y., and is probably, the best saw of its kind made. It consists of first, a scroll saw, with tilting table for inlaid work; arms 18 inches in the clear; clamps which will hold saws of any length or width, and face them in four different directions; cutting lumber from one sixteenth to one inch in thickness; speed, 1,000 strokes per minute. Second, a circular saw, two and one-half inches in diameter, which will cut lumber one-half inch and less; with an iron table four by five inches. Third, a drilling attachment, with six Stubs's steel drills of various sizes for wood or iron work. Fourth, an Emery wheel, with wide and narrow rim. Fifth, a Turning Lathe, with iron ways and rest, steel centers, and three best steel turning



tools; length of way, 15 inches; distance between centers, nine inches; swing, three inches; length of slide rest, 4½ inches; number of revolutions per minute, 7,000. Also, with each Machine, six Saw-blades, a Wrench, Screw-driver, extra Belt and two sheets of Designs, with a nice box for the small tools and a box for the whole Machine. It is taken apart when shipped and packed in a box, but the working parts are all left in place, and the frame is put together again by a single bolt. It is made of iron, with all the *working* parts of *steel*, and weighs 50 lbs. To say the least this machine is a very handy tool on the farm and to many it is indispensible. Boys with a taste for mechanical work can get nothing better to develop their ingenuity. We give this machine for a club of 20 subscribers.

"THE EYE-OPENER."

A Philadelphia firm is largely advertising a Bible for $1, but so words its advertisements that the ordinary reader understands that a fine Bible worth $15 is meant, instead of the paltry thing sent;—trickery in the sale of Bibles!!! . . The Chicago Oil Painting for 25c. humbug we showed up some time ago, and merely refer to it here to warn our host of new readers against this humbug of the "School of Design"—design upon the pockets of dupes! . . The Robbins Washer, price $4.00, is said to be a humbug, and described as a piece of cheap metal weighing six pounds. "The Bissel Co." are charged with humbugging folks with the thing.

NEW PUBLICATIONS.

Temperance Jewels. A new collection of Temperance, Reform and Gospel Songs, Duets, Quartets, Solos, and Choruses. By J. H. Tenney and Rev. E. A. Hoffman. Oliver Ditson & Co., Publishers.

Temperance musical literature has not, on the whole, attained a high rank; perhaps because of the homely subjects, on which poets do not care to sing. In this book, however, everything seems to be of a high order, and the words are full of encouragement to the reformed and the reformers. Clergymen will be pleased with the decidedly religious character of the songs, which are entirely in unison with the present reform movement.

MAGAZINES FOR FEBRUARY.

Harper's Magazine.—Contents: Bartram and His Garden; Foreign Tips; A Famous Breviary; Washington as a Burgher; A Visit to the Republic of San Marino; The Drop-Star, A Legend of Lake Kayutah; The Percheron and Norman Horse; The Lover's Peril, a Poem; Grub Stakes and Millions; White Wings, a Yachting Romance; Hector Berlioz; Mary Anerley, a Novel, Chap. XXIV. to XXVII; Mr. Keesler's Horse-Car, a Story; A Symposium of Wood-Engravers; A Night in an Avalanche; Editor's Easy Chair; Editor's Literary Record; Editor's Historical Record; Editor's Drawer.

Descending the Humboldt Mine.—Entering a rough wooden building, you see a steam-engine turning an immense drum, around which is coiled a wire rope. On a chair sits, with each hand on a lever, the bright, watchful engineer, his eyes fixed on the drum, now nearly covered with the coil. In another minute, click! the machinery has stopped, and out of an opening in front, like Harlequin in a Christmas pantomime, has come a grimy figure, who stands there smiling at you, with a lamp fixed on the front of his cap, and his feet on the rim of a great iron bucket. He steps off, the bucket is emptied of its load, not of rich ore, but of very dirty water, which it has brought up, and there is an air of expectancy among the workmen, and an inquiring smile on the face of Mr. Thornton, the superintendent. Something is clearly expected of you, for it is established that you are not what is called by the miners a "specimen fiend," or unmitigated sample collecting nuisance, and it is assumed that when you came hither to investigate you "meant business" You take the hint, and follow Mr. Thornton to a room, where amid a good deal of joking, you put on clothes—and such clothes!

If you have one spark of personal vanity, "all hope abandon, ye who enter here," for even your kind guide has to turn away to hide a smile when he sees you in overalls which will not meet in front, and are precariously tied with a ragged string, an ancient flannel shirt, the sleeves of which hang in tatters around your wristbands, and a cap which might have come over in the *Mayflower*, and has a smoky lamp hooked into its fast decomposing visor. As you approach the mouth of the shaft, the engineer genially remarks that there "ain't *much* danger," and when the bucket has come up and been partially emptied, the by-standers repeatedly advise you to be careful about getting in. As you climb perilously over the side, you think of the Frenchman who, starting in the fox-hunt, cried out: "Take noteece, mes amis, zat I leafe everyzing to my vife!" And when you are crouched down so that Mr. Thornton can stand on the rim above, you do not think at all, but know, that you are what Mr. Mantalini called "a dem'd moist, unpleasant body." Mr. Thornton makes a grim remark about it being as well to have some matches in case the lamps go out, gives the word, and down you go. Understand that there is just about room for the bucket in the shaft, that the latter is slightly inclined, and that you catch and jar and shake in a nerve-trying way; and understand, further, that a person should carefully study his temperament and possible disabilities before he takes a contract to go into a deep shaft.

At a certain depth—it may be 500 or 1000 feet (in some Nevada mines it is 2500)—you stop at side drifts or cross cuttings in which men are at work, and here you see, walled in by rock, the fissure vein. Some are "stoping," or cutting pieces away with the pick, others holding the steel wedges, and others striking them tremendous blows with sledge-hammers. They are, by-the-way, in the habit of accompanying these blows with guttural sounds, the hearing of which induced a special correspondent of the gentler sex—ignoring the fact that they receive three dollars per diem, own chronometer watches, and have fine bank accounts, and silver spoons on their tables—to write a soul-stirring description of the poor down-trodden miner, imprisoned far from the light of the blessed day, uttering terrible groans as he toiled his life away for the enrichment of the bloated and pampered capitalist. Other men, again, are drilling, loading, and tamping for the "shots," which are to tear the rock in pieces; and you will probably remember a pressing engagement "to meet a man" at some distance from the mine, and induce Mr. Thornton to ring for that moist car, and take you up before they light the match.—A. A. Hayes, Jr., in *Harper's Magazine for February.*

Lippincott's Magazine.—Contents:—A Day With the Ottawa Chantiermen, Frederic G. Mather; Summerland Sketches. Chapter VIII.—The Delta of the Sumasinta River, Felix L. Oswald; Adam and Eve, Chapters 4–6, The Author of "Dorothy Fox"; Old and New Rouen, Two Papers, I Edward King; A Future Capital of the United States; His Wife's Nearest Relation, Margaret, Bertha Wright; Decorative Art and its Dogmast Two Papers. I. M. G. Van Rensselaer; Through Borrowed Eyes, Elaine Goodale; The Peasant-Land of Lorne; E. N. Lamont; Little Angel, The Author of "The Clifton Picture"; Olivia; Wildwood Studies, Maria P. Woodbridge; The Bonapartes in Exile, Arthur Venner; Our Monthly Gossip.

The opening article, "A Day with the Ottawa Chantier-Men," by Frederic G. Mather, gives a lively account of the lumbermen, and much information about the resources and prospects of the great Canadian forest lands, with many good illustrations. "Old and New Rouen" is the first of two illustrated papers, by Edward King, describing in his usual flowing and graphic style the most picturesque and interesting of French provincial towns. The eighth chapter of Dr. Oswald's "Summerland Sketches," also illustrated, carries the reader to the Delta of the Sumasinta River.

For Women.

HONEYSUCKLE.

How fair they were, my darling twain,
Who walked adown the grassy lane
That sultry August day;
Unconscious of the golden charm
That floated round them, arm-in-arm,
They wandered on their way.

One wore her raven tresses low,
Close-braided, o'er a brow of snow,
Like some grand Roman dame;
Here were those luminous, large eyes,
From whose dark depths strange gleams arise,
And break in sudden flame.

Around her sister's gentler face
The brown hair rippled, tender grace
Was in her form and look;
A wild-rose color on her cheek,
Brown, loving eyes, contented, meek,
And clear as summer brook.

I sat beneath a shady tree,
And heard their laughter floating free,
Through idle, happy hours;
I saw them gather by the way
The struggling clusters, sweet and gay,
Of honeysuckle flowers.

I watch them wave their scented spoil,
In eager haste, with playful toil,
And laughter-brimming eyes;
They twined it on my faded brow.
Ah, heaven! I have that garland now,
A sacred, mournful prize!

Was it because they were my own,
I fancied even their lightest tone
More sweet than other sound!
Was it because I gave them birth,
I thought that nowhere on God's earth
Could fairer things be found?

Was it but doting mother's love?
Or were my darlings fair above
The playmates of their time?
I know not then, nor now I know,
It is so many years ago,
They scarcely reached their prime.

But this I know, 'twixt them and me
Rolls yet the awful, tideless sea
That parts their world from this;
And well I know that where they are
There is no need of sun or star,
Nor need of mother's kiss.

But o'er my honeysuckle wreath,
My wearied heart will often breathe
A prayer for those bright bowers,
Where I may see my daughters stand,
Each holding for me in her hand
Heaven's amaranthine flowers.

—*Weekly Times.*

A GOOD-BYE TO THE "RURAL" SISTERS.

A LITTLE over two years ago—September, 1877—I made my bow to you, good ladies, and asked you to aid me in making the Woman's Department of the "Old RURAL," useful, instructive and entertaining: you promptly responded, and by contributions, suggestions and kindly words of encouragement, have aided very materially in bringing the department to the degree of excellence it has attained.

The fashion articles, those which treated of home decorations, of art matters, of courses of reading and home study, and lastly, the dear, old, gossipy "Club," have all been received with marked favor, and I cannot but feel that you have really enjoyed the department.

The "good, old times" are gone forever, so far as I am concerned, for I must bid a sad good-bye to all the pleasant friendships and delightful associations resulting from the editorship of "For Women." With the close of the year 1879, my connection with the RURAL came to an end. In resigning my position which I do with sincere regret, I wish to thank you, one and all, dear ladies, for your uniform courtesy to me, and to add a "God bless you" to my good-bye. Sincerely your friend, now and always. FAITH RIPLEY.

348 W. 35th St., N. Y.

[We may say that we too, part with Miss Ripley with sincere regret.—EDS.]

"REDEEMING THE TIME."

MRS. E. GRIFFITH.

PERHAPS there is nothing in life at once so precious and so ill-used as time. The golden hours slip away empty-handed, bearing but little from the most of us with which to enrich the coming years; so that when God rolls up the scroll of life, instead of its being written within and without with deeds and thoughts worthy of an intelligent being, it is found to be but an empty, soulless blank.

No doubt the man in Scripture, who had labored diligently and reaped so great a harvest as to be obliged to "pull down his barns and build greater in which to stow his abundant grain," was esteemed by most people as a man of wisdom, a smart, keen, live, business man, whose clear head and active hands would not let one moment run to waste. Yet, God called him a fool. God deemed him most wasteful, because he had spent *all* his time in laying up treasure for himself, and had not a thought of any bank account in Heaven. And yet I think sometimes that we are just as wasteful and foolish.

So engrossed do we become in the question "what shall we eat, what shall we drink, and wherewithal shall we be clothed?" that the interests of the Kingdom are crowded out, to a great extent, till a more convenient season. God tells us to "Redeem the Time;" that is: put something aside which only serves to minister to the flesh, and give the time we would have devoted to it to a higher, nobler purpose. In a word, *sacrifice self.*

How much some of us do—we women Christains, that calls for hard, exhaustive labor and hours of precious time, that does not add one whit to our comfort or well-being, but on the contrary produces fretful weariness, sleepless nights, and thorough disgust with one's-self and one's surroundings, simply because "everybody does it."

Ruffled pillow-slips, embroidered underwear, tucked skirts, chair tidies, air castles, and over-trimmed dresses are considered so indispensable to a respectable walk in life that the most of us havn't any time for anything else except to make cocoanut cake, lemon-custard pies, rich preserves, and ever so many other things to eat that we can't possibly get along without. And so our souls starve. Isn't it strange we don't think more about it than we do?

For many years I have habituated myself to a course of daily reading, beginning with my Bible and winding up with a good newspaper. Sometimes, especially of late years, I have allowed it to be broken in upon for days together, and I cannot tell you what a loss it always has been to me. Now, perhaps some of you may think that I have nothing else to do. Allow me say you are greatly mistaken. I am a regular busy-body, have a household of four to look after and do all my own work.

ORGUINETTE.—STYLE "A".

But I'll tell you: I made up my mind long, long ago, to dress plainly, and wear my clothes out, regardless of the changing style; to never learn how to make tidies or log-cabin quilts, or air-castles, or tucked and ruffled pillow-cases, because I knew I ought not to take the time God had given me in which to prepare for the life beyond. Many and many a time have I wielded the washing machine with one hand while with the other I held a book which constituted a part of my reading course.

Make excuses as we will, the fact is, there are very few of us but might snatch up five minutes in which to garner up rich thoughts from all the busy hours of the day, sweetening our lives and lightening our toil. There are many minutes when we are getting dinner, waiting for irons to heat, etc., that we spend impatiently that might be given to acquiring some useful information.

No one, who has never tried the experiment, knows how such a process elevates and strengthens the mind and heart, puts a check to fretfulness, and satisfies the soul. There is no other class of persons in the world that has such widespread power for good or ill as women; no one class upon whom is imposed such grand responsibilities; none that have such an educating influence.

Let us look to it, then, Christian women, that we set a better example before our sons and daughters! Let us begin and *carry out* a grand substitutionary work, "Redeeming the Time," because—and is not this sufficient reason? "The days are evil." For you know "we do *all* things through Christ, who strengtheneth us." There is no *can't* with God.

THE ORGUINETTE.

THE orguinette is a new musical instrument of the organ class and constructed upon the same principles. The same class of reeds are used as in the organ and a similar sound is produced, but unlike the organ this little instrument is not played by striking the keys with the fingers. By turning a crank merely, a sheet of perforated paper passes under a series of fingers that fall upon the valves, these are opened and the sound which is sweet, brilliant and melodious is produced. It will be a matter of surprise to all who hear it that so unpretentious an instrument can produce such really good music. The perforated paper is to the orguinette, precisely what the sheets of music are to the practised performer—and it is an exact copy of the *effect* produced by such music, if it is run through the orguinette properly. We send with the Orguinette 14 feet of music, but any quantity may be bought at 6½ cents per foot, embracing dance music, songs, hymns, and all the most popular and recent music.

ORGUINETTE.—STYLE "C."

Any one can play the Orguinette that is old enough to turn a crank! and it is an unfailing source of amusement and pleasure, especially to the young folks. For a frolic it is immense! It reels off quadrilles in perfect time, and the changes are printed on the music at proper places so that a child can be orchestra and leader. We give style C for a club of 38 subscribers.

Style A is the same as above without the "Expression Box." We present it and 14 feet of music for a club of 20 subscribers. Both are made by the Mechanical Orguinette Co. New York City.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

WHAT A WOMAN CAN DO.—No. 3.

MARY BEAL MC'LOUTH.

BELIEVING that the laboring class are the healthiest, and knowing that many who are sick would exchange all they possess for health, I have written these articles to encourage all classes, both rich and poor, old and young, to spend as much time as is consistent with their engagements in the open air. Don't hide your face from the pleasant sunshine, for it alone will bring the color to your cheeks. Now I hear somebody say, just like all other country women, hasn't any pride. Very well, have it as you please! I remember only too well my childhood days when the big sun-bonnet was a constant burden, in which I was obliged to envelop my head or remain in the house. But as I grew older I concluded a brown color was better than none, and so going bare-headed, combined with out-door employment, has given me better health than I ever dared to hope *I* should enjoy.

The care of poultry the year through, is the most remunerative of any employment I can mention, besides being very pleasant. But allow me right here to give a word of caution. Do not begin on too large a scale or try too many kinds at once. Chickens are the most easily cared for, and I am sure the profit from them will exceed that from any other kind of poultry. From a child I always found pleasure in cleaning up the door-yard. On bright days in the spring, it's a real treat to get out and gather up the rubbish, which will accumulate during the winter. Unless you found time the fall before, put on some leather mittens, trim and tie the Raspberries. If you wish to delight the children, have husband make a bon-fire of the refuse, in the evening. Picking and caring for small fruit is very animating, especially if you are where you can sell readily, and you have a faculty for filling your dish rapidly. I have picked half the apples we had for our own use, standing in a wagon, driving from tree to tree as necessity required. In the fall get the whole family out husking. Pull down the shock, cut the standards, but let the men bind and set up. Don't try to do everything just as the men do. Instead of slashing off the stalks and making hard work of it, draw the corn cutter back and forth as you would a saw. It's easier, but, of course, slower. Husking is sport after the tramp, tramp, tramp in the kitchen. Besides, it counts more. A woman who can use a saw, hammer and nails, can every day, find ample scope for her abilities. My father taught me when young the use of tools, and I bless the day when I learned. It is a satisfaction to any one to have an article made or repaired, without waiting the motion of some uninterested person who does not see any necessity for doing it any way, and perhaps never gets quite ready, putting one off from time to time until too late.

I might tell how I made my apple-racks, making a mammoth, dry house of my kitchen; cut up a hard-wood box and made a door-step; put up a door to the hen-house with leather hinges (though others would be as easily put on if one had them); made chicken coops innumerable, of all styles and descriptions; sawed the back of an old chair, nailed on a board, and painted it, making a respectable wash-bench. A door that would not shut, was taken off its hinges and sawed off. A shelf was put up in the cellar way. Laths were tacked below the mop boards, in the store-room and closets up-stairs, to keep out the mice. A railing was made to prevent one from falling down-stairs. Strips of wood were put up in different places for hooks or nails on which to hang clothes. Some casters were put in the lounge. A board three feet long and one wide, with strips nailed on sides and one end, the end board projecting below, so as to raise it a few inches from the platform; this to prevent water from running back into the well—a very much needed and useful article. It's so unwholesome to have the water dripping back to be pumped out again.

To those who do not wish to work, I would say, walk, walk, walk! Don't be afraid of its making you weak and bringing on worse ills, but walk every day. I don't consider it's a woman's place to do all this work, but some feel the necessity of doing something, and so they had best do that which *is* best.

RUBBER GLOVES FOR DISH-WASHING.

SEVERAL months ago a Vermont lady inquired where rubber gloves could be had, and at what price. In Philadelphia the price for gloves, without wrists or gauntlets, is 95 cents; with wrists, $1 20. These prices were given me at Wanamaker's. The lady's inquiry would have been answered at once, but that her postal card was mislaid. I don't know the cost of a mop for dish-washing, but a clever woman can make that readily by fastening her dish cloth to the end of a stick. If it does not quite answer her purpose, it will give her the idea how to fix it right. Perhaps some RURAL reader can furnish a drawing with explicit directions. MARY WAGER-FISHER.

FASHIONABLE TIDIES.

CHAIR "scarfs," as they are called, may be made out of ribbon velvet, Turkish toweling, crash toweling, or even bed ticking. Stripe the crash or ticking with black velvet ribbon, red flannel, or cut the stripes from a pretty cretonne, and fasten down the edges with any fancy stitch in floss or worsted. The spaces between the stripes may be worked with silk or worsted, all of the same design, or each different and of a different color. Finish the ends with a fringe of the same, or of worsted or silk to match the stripes. I have just finished a handsome "scarf" made out of Turkish toweling and ornamented with cretonne figures, fastened down in feather stitch. I fringed out the ends a finger in depth, and fastened in gay colored floss to match the cretonne. The length and breadth of a "scarf" must depend upon the size of the chair it is to ornament.

MRS. S E. W.

SAUSAGES AGAIN.

MRS. E. K. R.

NOT too late, however, to be of use to some belated housekeepers who have not yet struggled through the wearisome work attached to "bootcherin time." It was a long time after my first experiment in sausage making before I found a recipe that exactly suited my "gudemon's" taste, although every year I tried a new one. One would think that common sense might have taught me that nine teaspoonsful of pepper, nine of salt, and three of powdered sage to every pound of meat (which were the directions found in an old English cook-book,) would be too high a seasoning for all ordinary palates. Nevertheless, it was tried among the rest, and even the chickens to which it was finally consigned, found the result beyond their endurance. After many failures in getting just the right proportion of meat, salt, etc., a good old Dutch lady gave me the recipe which I have followed for several years with increasing satisfaction. Here it is: 25 pounds of meat, nine ounces of salt, two ounces of pepper, two ounces of saltpetre, one and one-half ounce of sage. Pack in bags made of old but strong cotton, cut about five inches in width and fifteen in length. When filled, tie with a cord long enough to make a loop to hang them by, and hang in a cool place. When you want to open a bag, rip open the lower end, turn the cloth back far enough to cut off what slices are needed, then fold the cloth down again to exclude dust and air. In this way you have the same loop to hang by until the whole bag is used.

Sausages are sometimes made of equal quantities of beef and pork, but they never should be, for the reason that pork needs longer frying than beef does, and by the time the pork is cooked sufficiently, the beef is all frizzled and dried up.

DOMESTIC RECIPES.

Pickled Oysters.

DRAIN and strain the liquor from off the oysters, bring the liquor to a boil, put in the oysters and boil *one* minute; skim out, add the same quantity of vinegar as liquor, a few cloves, mace and a little pepper and salt. Boil fifteen minutes, then pour over the oysters.

Orange Marmalade.

Take ripe oranges, pare off the outside rind very thin, and boil until tender; then cut into tiny strips. With a spoon take out all of the juicy pulp, throwing away the white pith. Mix the pulp and juice with the tender peel, weigh, add an equal weight of sugar and boil in a preserving kettle for half an hour, stirring constantly. Put away like jam. M A. B.

Ready-Made Portable Soup.

The following method of preparing soup stock for use the year round, is excellent, besides being a very convenient article to have on hand. With it a good soup can be made in half an hour. Into a large kettle put about four gallons of cold water, then put in ten pounds of a shin of beef, free from fat, six

pounds of a knuckle of veal and two chickens; —the meat of all cut into small pieces and the bones broken. Cover closely and let *simmer* all day, then strain it. Next day take off the fat, clear the jelly from any sediment adhering to it, and boil gently, uncovered, until it thickens to a strong glue. Then pour it into pans and put in a cool oven. When it will take the impression of a knife, check off, then finish drying. Wrap in paper and pack in boxes

MRS. E. C.

Apple Pudding.

Apple pudding is one of the most easily prepared and palatable of deserts. Place a large layer of sliced apples in the bottom of a buttered earthenware baking-dish. Sift three teaspoonsful of baking powder and a little salt into three cups of flour, and stir in sweet cream until it is a thick batter. Where cream is lacking butter and water will answer. Spread the batter over the apples and bake one-half hour. Eat with sweet sauce.

Chicken Pie.

By making a batter after above recipe and pouring it over a dish of boiled and well-seasoned chicken, a nice chicken pie can be made on very short notice. An old and tough fowl or any tough meat can more easily be made tender and nicer cooked under a *cover of dough* than in any other way, probably because of the closer confinement of steam.

Ice Cream.

A very good substitute for ice cream may be enjoyed during any snow-storm. Beat thoroughly one egg, a cup of thick sweet cream, a cup of sugar, and add a little lemon or vanilla flavoring. Set it in the coolest place to be found for an hour (if longer all the better). Just before eating stir thick with light snow. E K. B.

QUESTIONS ANSWERED.

Coloring Recipes.

PLEASE give me some good recipes for black and other colors. They will be read with interest in this Western wild.

MRS. N. J. CIRCO.

Black on Woolen.

Work five or six pounds of cloth for one hour in a bath (at a boiling heat), with eight ounces of bichromate of potassa, six ounces alum and four ounces fustic; lift, expose to the air and rinse through warm water. Refill the kettle with clean water, add four pounds logwood, four ounces boxwood and four ounces of fustic. Let the goods simmer in this one hour; lift, add four ounces of copperas in solution, and work half an hour longer. Wash thoroughly and dry.

Black on Cotton.

Steep 10 pounds of cotton in a decoction of three pounds of sumach while it is hot, shaking and airing several times, and let stand all night. In the morning work for 10 or 15 minutes in a tub of lime-water, then work for half an hour in a cold solution of two pounds of copperas. Again work through lime-water, then for half an hour through a warm decoction of three pounds of logwood and half a pound of fustic previously scalded. Lift out goods and darken liquid with two ounces of copperas in solution. Work ten minutes then wash and dry. All black goods should be washed in soap-suds after coloring.

Blue on Cotton—No. 1.

To dye 10 pounds of cotton: Put into a tub sufficient cold water to work the goods easily, add one-half pint nitrate of iron and work in this 20 minutes; wring out and pass through a tub of clean water. Into another tub of cold water mix four ounces of ferrocyanide of potassium in solution and a wine-glassful of sulphuric acid. In this work the goods fifteen minutes. Wring out and wash through cold water in which is dissolved one ounce of alum. This is for a light shade of blue. For a darker shade add more ferrocyanide and iron.

No. 2. Dissolve two and a half pounds of copperas in sufficient water to allow of working 10 pounds of cloth. Boil two hours, take out, rinse, refill kettle with clean water and add one-half pound prussiate of potash. Boil about half an hour, lift out goods, add one-half pound of oil of vitriol, return and boil half an hour longer.

Green on Cotton.

It is only necessary to add eight pounds of fustic and half a pound of alum to the last recipe to produce a good green. Simmer the goods in the decoction until the required shade of green is obtained.

Brown on Woolen.

Work 10 pounds of goods half an hour in a bath made up with two pounds of fustic, two pounds of madder, one pound peachwood, and four ounces of logwood; lift, add two ounces of copperas. Work for half an hour longer. Wash and dry.

Crimson on Woolen.

Work in a bath for an hour with one pound cochineal paste, six ounces dry cochineal, one pound tartar and one pint single chloride of tin. Wash and dry. This is for 10 pounds of goods.

Olive on Woolen.

For 10 pounds of goods work for an hour in a bath made up with 10 ounces fustic, eight ounces logwood, four ounces madder, and two ounces peachwood; lift and add four ounces copperas in solution. Work for thirty minutes.

Tan on Cotton.

Boil slowly one-half bushel ground tan bark in water enough to cover 10 pounds of cloth, for three or four hours; strain the dye; put in the goods and let stand five or six days by the stove, airing several times. When the color is the shade desired, rinse and dry.

Orange Pudding.

Mrs. B. asks for a recipe for the above.

ANS.—We do not know of any directions better than those given by Mrs. D. Snedeker, in the RURAL of Jan. 19, 1878, which we will republish:

Three pints of milk; seven heaping tablespoonsful of sifted corn starch (Gilbert's); yelks of four eggs; salt, flavor and sweeten to taste; peel six oranges; cut into fine pieces and remove the seeds; lay in the bottom of a deep pudding dish; sift over as much sugar as required; when cool, pour over the oranges the corn starch; beat the whites of the eggs to a stiff froth; add two tablespoonfuls of sugar; flavor and spread over the pudding; place in the oven until the meringue is of a delicate brown. Although this recipe seems simple, it requires care in putting the ingredients together. First, let the milk come to a boil; add the corn-starch, which has previously been dissolved in a little cold milk; boil until it thickens; take from off the fire and stir in the well-beaten yelks the sugar and flavoring; return to the back of the range for a few minutes, stirring constantly; when again taken from the fire beat the corn-starch until it is cool enough to pour over the oranges. This constant beating prevents the corn-starch from being lumpy. The meringue should not be made until the pudding is ready for it to be spread over the top and placed in the oven.

News of the Week.

MISCELLANEOUS.

Monday, January 26, 1880.

Preston D. Mood, editor of the Clarendon Press, Columbia, S. C., and son of Henry M. Mood, one of the most distinguished preachers in South Carolina, committed suicide at Manning village last week by blowing out his brains with a pistol. Mood had addressed a beautiful Jewess, and threatened to kill himself if she refused his offer. Notwithstanding his threat the fair daughter of Israel rejected him, and the rash young journalist thus put an end to his life. . . . A new law in regard to regulating the railroads, it is hoped, will be enacted in New York State. The Legislature appointed a committee to investigate the charges the people have made against the roads. Monopoly, unjust discrimination in charges of freight and even secret bargains and favors shown to certain merchants, which gave them unfair advantages over their fellows, and corruption in the election of railroad officials were shown to exist. To remedy these, the committee proposed that a commission of three be appointed to overlook all the roads in the State, and to compel them to respect the laws. These laws are not yet made, however, but public opinion is so aroused on the subject that it is hoped the Legislature will be forced to do its duty. . . . A lady in Hoboken, a well-to-do merchant's wife, has just invented a street sweeping machine, which is said to be far superior to any now in use. The patent is just taken out. Her name being Eureka C. Browne, she proposes to call it "The Eureka Street Sweeper." . . . An accident occurred on the Virginia Midland railroad on the morning of the 23d inst. A material train consisting of engine, coal car, nine flats and a caboose, in rounding a curve near Charlottsville at a great speed, struck a large rock which had fallen from the cut on the track during the night. The engine was thrown from the track, but miraculously it again jumped on the rails and was saved. The rest of the train was wrecked; two persons killed and seven severely injured. . .

The penalties of obstructing census-takers, who begin their labors on the first Monday in June, are severe. The law says: All persons above the age of 21 years who shall refuse to furnish the information required by the supervisior or enumerator shall forfeit and pay a sum not exceeding $100, to be recovered in an action of debt. Presidents, directors or other officials of private corporations who refuse to furnish information required of them, are made liable to a penalty not to exceed $10,000. Only two weeks are allowed for the completion of the census. The compensation of the enumerators is the following: Two cents for each living inhabitant; two cents for each death reported; ten cents for each farm; fifteen cents for each manufactory, which is to be in full for all services, and no mileage or traveling expenses. The subdivision assigned to each enumerator must not exceed 4,000 inhabitants.

Negotiations with the Ute Indians are in progress, at which three things are to be accomplished:

First—to have the treaty provisions about the surrender of offenders carried out so that the participants in the White River murders can be tried.

Second,—To make such an arrangement with the Utes as will avert from them the injuries that are threatened to be inflicted upon them by the border population of Colorado, and which certainly would come if the present boundaries of the reservation were preserved. This accomplished, the present difficulties will pass over without an Indian war, which will be a great benefit to the country generally.

Third.—To secure for them full compensation for every piece of land they may cede to the United States and a safe and advantageous settlement for the future.

Last week we stated that the Maine difficulties had taken shape in favor of the republicans. These are still in power and, if anything, their claims have been better established during the week. On Monday Governor Davis determined not to admit the fusionists to the State House and accordingly a strong force of police was placed at the gate, and others around the building. The fusionist legislature appeared in a body and demanded admission. The Speaker of the House, the President of the Senate and their Governor successively demanded admission at the gate of the capital where they were met by the Mayor of Augusta, backed by a large force of police, who, refused each in turn, to enter, stating that he had orders to that effect from the Governor, Mr. Davis. The fusionists then adjourned to Union Hall where they have met every day since. They have submitted questions to the Supreme Court the answers to which is expected greatly to influence their future actions. Last Friday the proceedings took an exciting turn; bloodshed seemed almost inevitable. It leaked out that the fusionists had secretly enlisted some 260 men from Augusta and other places for the purpose of forcing admission to the capitol. This created a sensation all over the State. The republicans got into a flurry. The militia of the State was ordered out; several companies were stationed in the capitol, and everybody turned with breathless expectancy to the coming skirmish Such is the situation at present. No violence has as yet taken place, but the military is ready should aggression be made. It is to be hoped shat this rivalry will be settled without bloodshed. The Maine Legislature has been petitioned for a subsidy for sugar beet culture.

It was the birthday of Burns, the favorite bard of Scotland, last Sunday, the 25th. . . . The first serious accident has occurred on the elevated railroad, New York City. On Saturday morning last, a locomotive jumped the track near 143d street and fell to the street below, a distance of 25 feet Only one car was attached, and it remained on the structure. None were killed, but seven persons were injured; some severely.

FOREIGN.

Jules Favre, the French statesman, is dead ... All the Russian Ministers, except those of War and Marine, are said to have been put under M. Wallujeff who advocates internal governmental reform....In Germany many of the provisions of the Falk laws most obnoxious to Roman Catholics are about to be repealed. Berlin and the Vatican are coming closer together; the Liberals fear they may come too near....Last Monday a terrible explosion occurred in the Lycett colliery at Newcastle-on-Tyne, England, by which nearly 100 workmen were killed....The English Government lately bought all the telegraph lines, and has now sued the telephonic companies to force them to take out licenses and pay royalty, as interfering with the monopoly....In Rio Janeiro, Brazil, the government levied a small tax on the street cars. The mob indignantly destroyed the cars and tracks, stoned drivers and conductors, and fired on the troops called out to suppress the riot. The latter returned the fire, killing three, wounding thirty, and dispersing the mob....The Peruvian and Bolivian forces in the province Tarafaca are reported to be surrounded by the Chilians, and negotiations for their surrender are said to be proceeding. Peru, which began the war, is doing no better under her recently appointed dictator than under her deposed president, and must soon sue for peace. England is said to be about to interfere, but our government know nothing of this threatened infringement of the Monroe Doctrine... The Cuban Slavery Abolition Bill passed the Spanish Chamber of Deputies on Wednesday, by 230 to 10 votes....Italy has raised the yellow fever quarantine against vessels from this country....The Russian forces intended for the campaign against Merv in spring, have been severely defeated by Turcomans at Tchikislan, south of the Caspian. This, it is thought, will greatly interfere with the projected expedition, if it doesn't prevent it for this year....The British are making good headway in Afghanistan, and will seize upon Herat, it is said, in spring. Some say they will occupy the country; others that they will appoint a creature of their own as king and retire to India —hardly the latter....General Grant has arrived in Havana, and put up at the palace prepared for him by the Governor-General....The first blast to begin the cut through the Isthmus of Panama, for the Lessep's Canal, was fired on the 10th inst., on the highest part of the Isthmus, and displaced a huge mass of rock....The City of Odessa is suspected to have been undermined by Nihilists. Great alarm....A proposed increase of the German army by 20,000 men.—A peaceable sign this!....In France the radicals are jubilant; the moderate republicans just a little discontented; other factions immensely so. The last of the imprisoned Communists will probably soon be pardoned.

In Russia the crops of 1879 were so short that it is expected that it will be necessary to import American grain into that country the coming spring.

Malarial fever, Ague, and Biliousness will leave every neighborhood as soon as Hop Bitters arrive.

HOARSENESS.—All suffering from *Irritation of the Throat and Hoarseness* will be agreeably surprised at the almost immediate relief afforded by the use of *Brown's Bronchial Troches*"

For diarrhœa, dysentery, bloody-flux, cramps in stomach, and colic, whether affecting adults, children, or infants, Dr Pierce's Compound Extract of Smart-Weed is a sovereign remedy. It is compounded from the best brandy, Jamaica ginger, smart-weed, or water-pepper, anodyne, soothing and healing gums. For colds, rheumatism, neuralgic affections, and to break up fevers and inflammatory attacks it is invaluable and should be kept in every household. Fifty cents by druggists.

The Markets.

THE GIST OF THE MARKETS.

GIST of the markets can be readily seen by the summary at the head of each. A bad tumble for wheat—Eh? Hogs are coming in in large supply, and will be in larger, so soon as the roads become somewhat less impassable through fathomless mud a good cold spell wanted to raise prices. Many complaints nearly everywhere that these alternate thawings and freezings are likely to injure fall planted crops.

SPECIALS FROM ALL CENTERS.

Until Saturday, Jan. 24.

Boston.—Since last report corn has fallen 2c. on lower grades, steady on upper; oats 1c. lower on poorer grades, steady on others; rye unchanged; feed steady.

CORN quiet; sales of new at 58@63½c. OATS—No. 1 and extra white at 51@55c.; No. 2 white, 50c.; No. 3 white and No. 2 mixed, 47@49c. RYE nominally 95c.@$1. SHORTS selling at $20@21; fine feed and middlings, $21@22.

Rest of Boston Report has unfortunately not reached us as we go to press this week.

Baltimore.—Since last Saturday corn and oats are about steady; rye from 1c. to 2c. higher; hay unchanged; Western packed butter 3c. lower; rolls unchanged; eggs, ditto

WHEAT—Southern red $1 37@1 40; amber $1 43@$1 47; No. 2 Western red winter spot and January $1 39@1 39½; Feb. $1 40@1 40¼. March $1 42¼@$1 42¾; April $1 44¼@1 44⅝. CORN—Southern white at 58@60c; do, yellow, 57½@58c; western mixed, 56½@56¾c; steamer, 55@55½c. OATS—Southern at 48@50c.; western white at 48@49c; do mixed at 46@47c; Pennsylvania at 48@49c. RYE dull at 90@95c. HAY firm; prime to choice Pennsylvania and Maryland at $17@18. BUTTER steady; prime to choice western packed, 20@26c; roll 18@23c. EGGS quiet at 14@15c.

Buffalo.—Since last, corn steady: oats from 1c. to 1½c. lower; rye 2c higher; little charge in prices of cattle; sheep from 20c. to 25c. lower.

WHEAT—Dull and unsettled; nothing doing for some days; buyers and sellers apart; tending downward. CORN—No. 2 Western, 49@50c; old do. at 52@53c. OATS—No. 2 Milwaukee on track 43c. RYE nominally held at 91c. for No. 1 Milwaukee MILL FEED in fair demand and firm; coarse at $18@19; fine at $18@19; finished at $18. CATTLE—total receipts for the week 15,910 head; for the same time last week, 12,223 head; good demand and prices firm, run light; all offerings taken; fair to medium at $4@4 50; good shippers at $4 65@4 75; still-fed bulls at $3 40. SHEEP AND LAMBS—total receipts for the week 19,800 head; for the same last week 18,300 head; good demand and prices firm; offerings compare favorably with last week; fair to good western sheep at $4 80@$5 25; choice at $5 50; poor to good lambs at $4 60@$6 30; no Canadas on sale; best grades disposed of. HOGS—total receipts for the week 30,805 head; for the same time last week, 31,385 head; demand fair and prices going up for Yorkers; heavy dull; no local demand; sales of good to choice Yorkers at $4 70@4 80; extra selected at $4 85; heavy and medium at $4 75@4 90; fair ends at $4 20@4 60; coarse rough to common at $3 10@4 15; pigs at $4 05@4 25; a few remain unsold.

Chicago.—Since last No. 2 Chicago spring wheat has fallen 5½c. for cash and proportionately on futures, and No. 3 do. 4½c.; corn has dropped about 2c.; oats from ½ to 1½c. and rye from 1 to 2c.; butter and cheese steady; cider, do.; potatoes about 5c. lower; seeds a shade lower; apples and cranberries steady; No. 1 timothy hay from 50 to 75c. lower; mixed timothy, 50c. lower; other sorts unchanged; prime cattle from 30 to 60c. higher, other sorts unchanged; sheep about 40c. lower; hogs from 15 to 27c. higher.

WHEAT—Unsettled and almost panicky, closing heavy; No. 2 Chicago spring, $1 14¾ cash; $1.14¾ for Feb.; $1.16 for March; No. 3 do., $1.02. CORN active, firm, but unsettled: 37¾@37¾c., cash; 37¾c. bid February; 37¾c. March; 42¾c. May; rejected at 34½c. OATS unsettled at 33½c cash; 33c. February; 37½c. May. BARLEY firm at 78c. BUTTER, good to choice creameries, 28@33c. ₩ lb.; fine to fancy dairies, nearly equal to creameries, 24@25c.; good to choice fresh made dairies, 20@22c.; fair to good dairies, in shipping lots, 16@19c.; common to medium qualities, 13@15c; roll butter, 16@20c. CHEESE—Full cream cheese continues in good request, and owing to the small stocks and the favorable outlook, the market is firmer and stronger than a week ago. Prime full cream at 13@14½c. ₩ lb. Sharp and off flavor, 12@13c.; part skimmed, good to prime, 12@12½c.; hard skimmed, 9@10c., and common sour stock, 8@9c. CIDER—Only a small demand existed for this article, and the market was little better than nominal at $4@4.25 ₩ bbl. for good to choice Michigan stock in a small way. New York prepared cider sells slowly at about $5 ₩ cask and at $2.25 ₩ keg. EGGS—The receipts continue liberal, the demand slow, and prices weak, sales of fresh stock in a small way being made at 15@16c. ₩ doz The best "candled" lots bring 12@14c. and ice-house stock is dull at 5@10c. POTATOES—Peachblows by the car-load at 50@55c. ₩ bush. for good to choice stock; Early Rose at 45@50c. Other varieties and mixed cars were salable at 38@42c., and in a small way from store 5@10c. ₩ bush higher rates were obtainable, tendency of prices downward. SEEDS—Common to prime timothy, $2.70@2.80 ₩ bush.; prime medium clover at $4 80@4 85, and high grade to choice do. at $4.95@5.10; flax at $1 56@1.57 on a basis of pure; prime millet at 85c. and do. Hungarian, at 90@95c. GREEN FRUIT—Apples, common to only fair stock sells slowly at $2@2 50 ₩ bbl. and good to choice at $2.75@3. Car-lots at about the same prices that are asked in a small way. CRANBERRIES were in fair request and firmly held at $7.50@9 ₩ bbl., the outside figure for choice cultivated. HAY—Current quotations for car-lots on track range as follows: No. 1 timothy, $14@14.50 ₩ ton; No. 2 do, $13@13.50; mixed timothy, $11@12; upland prairie, $11@11.50; No. 1 prairie, $9@10; No. 2 do, $2@8 50. Small bales sell at 25@50c. ₩ ton

more than large bales; No. 1 timothy at $14.50. HOPS—Good to choice New York hops of this year's growth at 40@45c. ₩ lb; do. Wisconsin, 30@38c.; New York crop of 1878, 13@20c.; Wisconsin do. do., 5@15c., according to quality, and still older lots, 2½@5c. VEGETABLES—A moderate business is being done in this line for the season, and prices are steady. Cabbage, $5@8 ₩ 100; rutabaga turnips, 30@32c. ₩ bush; parsnips, $1.50 ₩ bbl.; carrots and beets, $1.25@1.50 ₩ bbl.; celery, 25@35c. ₩ dox. Spinach was salable at 40@60c. ₩ box. HOGS, mixed packing at $4 35@4.50; light at $4.40@4.55. All sales were made subject to the usual shrinkage of 40 lbs. for each piggy sow, and 80 lbs. for each stag. CATTLE, good to prime in good demand at full prices, with a good supply at $5@5.75; common to medium shipping dull and slow at $3.60@4 25; butcher's weak and slow; common stock, heaviest, at $2@2 90, chiefly at $2.35@3 25; stockers and feeders quiet and slow, but steadily at $2.70@3 90. SHEEP, weak end slow, $4.10@5.37½; lambs at $4.75.

Cincinnati.—Since last wheat has not altered, ranging last week from $1 27 to $1 30; corn a shade higher; oats and rye steady; butter steady; cheese a shade higher; beans unchanged; chickens a shade higher; ducks 25c. lower; live turkeys from 1c. to 1½c. lower; rabbits from 25c. to 50c. higher; quail from 50c. to $1 higher; bran $1 50 higher; middlings $2 higher for best, other sorts steady; hay and seed steady; hogs about ditto.

WHEAT dull and nominal at $1 28. CORN active and firm: No. 2 mixed at 43c. OATS steady at 40c. RYE quiet at 33c. BARLEY steady 90c. BUTTER—The market has ruled dull throughout the week, all grades in good supply, yet in consequence of bad roads there was no danger of an accumulation. Fancy Western Reserve is quoted at 24@25c., and choice Indiana and Central Ohio at 20@22c.; medium at 15@18c., and common at 12@14. CHEESE—The market closed firm for prime to choice factory at 13@14c. per pound, with a good demand. BEANS—Common at 75c.@$1, and fair to good white at $1 10@1 25 per bushel on arrival, prime to choice medium and navy $1 40@1 50 per bushel on arrival, and $1 65@1 75 per bushel from store. EGGS were in liberal supply and weak, the jobbing demand light at close, 12½@13c per doz., round lots dull at 12c. POULTRY AND GAME.—Chickens at $2.50@3.25; ducks, $2 25@2.75, and geese at $3.25@3.75 ₩ dozen. Live turkeys are dull at 6@6 1-2c. and dressed at 8c per pound. Game scarce. Rabbits sell at $1 50@1 75 per dozen. Quail would bring $2 50 per dozen. FEED—Bran scarce and firmer, with a good demand at 12 50@$13 per ton, in bulk on track. Shipstuffs quiet at $12@$13. Middlings firm and fairly active at $15@$22. Stuffs in sacks held at 50c per ton higher than the above quotations. HAY fairly active and firm; prairie hay, $10@$12; fair to prime mixed, $14@$15; fair to prime timothy, $15 50@$16 50; choice light pressed timothy, $17 00@17 50 ₩ ton on arrival, and $1 00@2 00 more from store. SEEDS.—Timothy firm, with a fair jobbing demand at $3 00@3 10 per bush. Clover seed quiet at 8 1-2@8½c ₩ lb from store, and 8c on arrival. Flaxseed in good demand at $1 20@1 30 ₩ bushel on arrival. HOGS steady and firm; common at $3 80@4 30; light at $4 35@4 55; packing at $4 50@4 70; butchers' at $4 70@$4 75. Early in the week prices were higher, but a large supply coming in, and the weather growing milder, they dropped.

Detroit.—Since last, No. 1 white Michigan wheat has fallen 6½c. for cash, and 9½c. for May, and proportionately for intermediate; corn just a shade higher; oats from ½c. to 1c. higher; clover seed steady; dressed hogs 90c. higher.

WHEAT—No. 1 white Mich., $1.23½ spot and Jan.; $1.24 Feb.; $1.26½ March; $1.29 April; $1,30½ May. CORN quiet and steady; No. 1 yellow at 49½c.; high mixed at 48c.; No 1 mixed at 48c.; No. 2 do. at 46c. OATS scarce and advancing; No. 1 white at 41½@42c.; No. 2 do. at 40½c.; No. 1 mixed at 40½c.; No. 2 do. at 38c. CLOVER SEED very dull; No. 2 at $4.30; prime at $4.65. DRESSED HOGS scarce and in good demand at $5.15@5.20.

Indianapolis.—Since last wheat has fallen from 3c. to 4c.; corn a shade higher; oats about steady; hogs from 10c. to 25c. lower.

WHEAT quiet; No. 2 red at $1 23@1.25. CORN strong at 37½@39c. OATS strong at 35 1-2@38c. HOGS strong at $4.00@4.60.

Liverpool.—Eng. Jan. 24.—PORK—Prime mess, Eastern, 62s., Western, 59s. per barrel. CHEESE—American choice steady at 72s. per cwt. WHEAT—No. 3 spring dull at 10s. 2d. per 100 lbs.; No. 2 spring dull at 10s. 7d; new winter western dull at 11s.; new southern winter dull at 11s. 2d. CORN—Mixed at 5s. 7d. per cental for old; new firmer at 5s. 5d.

Louisville.—Since last report wheat has fallen from 1c. to 3c.; white corn steady, mixed 2c. higher; oats, mill offal, onions and potatoes all unchanged.

WHEAT dull at $1.25@$1.29. CORN steady; white at 46c.; mixed, 43c. OATS dull; white at 41c.; mixed, 40c. RYE quiet at 57c. MILL OFFAL.—We quote per ton in bulk: bran, $12.50@$13.50; shipstuff $15; middlings, $15.50. HAY.—Demand has been fair, and prices have not varied materially. We quote prime and choice timothy at 16.50@$18, and mixed at 12@$14 per ton on arrival. VEGETABLES, on arrival, onions, for home-grown and Northern, 3@$4 per bbl. Russets, peachblows, and Peerless potatoes, from store, in cooperage, at $1.75@1.85; Early Rose, 2@$2.25 per bbl. HORSES AND MULES.—Plug horses, 35@$60; smooth southern shippers, 60@$80; good drivers, 80@$100; saddle horses, 90@$110; combined horses, 110@$125; extra, 135@$150. Mules—14 to 14½ hands high, 55@$60; 14½ hands high, 65@$75; 14 to 14½ hands high, 60@$75; 14½ to 15 hands high, 75@$90; 15 to 15 1-2 hands high, 90@$110; 15 1-2 to 16 hands high, 110@$1.25; 16 hands extra heavy, 125@$140; demand growing brisk and prices stiff.

Milwaukee.—Since last report No. 1 Milwaukee wheat has fallen 8c. and soft 8 1-2; other grades proportionately. Corn has dropped 1½c.; oats, 1 1-2c.; rye, 2c and barley 4c.; live and dressed hogs a shade lower.

WHEAT unsettled, but more steady towards the close: No. 1 Milwaukee hard, $1.17 1-2; do. soft, $1,16 1-2; No. 2 Milwaukee, spot and Jan., $1.14 1-2; Feb., 1.14½; March, $1.16½; No. 3 do., $1 01; No. 4. do. 93 1-2. CORN, No. 2 at 28. OATS, No. 2 at 33 1-2. RYE dull; No. 1 at 74c. BARLEY dull; No. 2 spring at 69c. HOGS.—Live, quiet and steady at 4.25@$4.70; dressed, in fair demand and firm at $5.

New Orleans.—No report last week.

OATS easy at 52@53c. CORN MEAL strong at $2.90@3.25. HAY firm; prime at $23@24; choice at $26. SUGAR unsettled; inferior, 4 1-2@5 1-2c.; common to good common, at 6@7c.; fair to fully fair at 7@7½c.; prime to choice at 7 1-2@8c.; yellow clarified at 8½@8¾c. RICE firm; Louisiana ordinary to choice at 6½@7½c. BRAN dull at 73 1-2@75c. COTTON steady; middling, 12c.; low middling, 11½c.; good ordinary, 11½c. Weekly net receipts, 11,344 bales; gross, 75,189; exports, to Great Britain, 23,479; to France, 11,477; to the Continent, 5,002; coastwise, 9,409; sales, 31,050.

Philadelphia.—Since last, rejected wheat has fallen from 5c. to 7c.; Penn. red from 1-2c. to 1c.; Southern amber 1-2c. higher; No. 2 red 1½c. lower for cash. Corn from 1-2c. to 1c. lower; oats from 1-2c. to 3c. lower on different grades; creamery butter steady; Bradford Co. and N. Y. 2c. lower; rolls 5c. lower; other grades unchanged. Eggs 1c lower. N. Y. factory cheese steady; Western 1c. higher.

WHEAT weak and unsettled; little or nothing doing for export; rejected, $1.26@1.28; Penn. red, on track, $1.40@1.40 1-2; Southern amber, on track, $1.42. At Open Board, No. 2 red, $1.39½ for Jan.; $1.39½ for Feb.; $1.41½ for March. CORN dull and weak; western Pennsylvania and Southern yellow on track and in grain depot, at 57 1-2@58c.; Western mixed, on track, at 57c.; Southern white, on track, at 60c. OATS weak; stained, 40@46 1-2c.; mixed, 47c.; fair to good white, 47@48c.; choice to fancy do., 48 1-2c. BUTTER dull and weak; creamery extra at 32@34c.; Bradford county and New York extra at 25@26c.; Western Reserve extra at 23@25c.; do. good to choice at 17@22c.; rolls weak; Pennsylvania extra at 16@18c.; Western Reserve extras at 19@20c. EGGS dull; Pennsylvania at 18c; Western at 17c. CHEESE—New York factory at 14@14 1-2c.; Western full cream at 13½@14c.; do. good at 12 1-2@13 1-2c.; half-skims, none here. BRAN firm at $19.50@21.00. HAY AND STRAW.—Rye straw is plenty and dull, and low grades of hay are hard to move, but prime timothy continues in good request and firm; hay, $12@20; prime baled do., $18@19; rye straw, $20.50@21.50; wheat do. at $12, and oat do. at $13 per 100. SEEDS.—Clover seed has been exceedingly dull; Western and Pennsylvania, in lots, at 7@7¼c.; timothy seed is firm at $3 per bushel; Flaxseed scarce and in demand at $1.60; Calcutta linseed sold at $2.37 1-2; orchard grass commands $1.75.

St Louis.—Since last week No. 6 red fall is 5¾c. lower for cash, 7½ for Feb, from 7¾c, to 9c. for March. Corn and oats a shade higher; rye 4c. lower; hogs from 10c. to 15c. higher; cattle and sheep a trifle lower.

WHEAT.—Lower and demoralized, especially for March and April. No. 2 red fall $1 20 cash; $1 21 Feb; $1 21½@1 25 March; $1 27½@1 27¾ April; No. 3 do. $1 17 bid. CORN strong at 36c. cash; 35¾@35½c. January; 36½@36¾c. February, 37¼c. March; 40¾@40¾c. May. OATS firm, but slow at 37¾c. cash; 39¼c. May. RYE quiet at 75c. HOGS active; light shipping at $4. 20@4 30; packing at $4 40@4 60; butchers' to select at $4 60@4 75. CATTLE in light supply, mainly of fair-fleshed native steers, which sold quickly at $4 40@4 75; good to choice scarce and wanted at $5@5 50; butchers' stuff easier at $2 37½@3 62½; feeders at $3 70@3 90; good to choice corn-fed Texans at $3 75@4 15. SHEEP firm at $4@5 25.

Toledo.—Since last week corn nearly steady; oats and clover seed 2c higher.

CORN dull; No. 2 spot at 40¾c; May at 45c; rejected at 40½c. OATS quiet; No. 2 May, 40c. CLOVER SEED dull; prime held at $4 75 at the close.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 24, 1879.

BEANS AND PEAS.—Marrow beans are higher; medums steady and firm. Light receipts help sellers. White kidney quoted above red this season. The late rush of orders for green peas has been filled; market 5c. lower, but no pressure to sell; quoted, $1.75@1.80. Southern B. E. peas per 2 bu. bag, $2.25; marrow beans, prime, $1.75; other, $1.55@1.65; medium, prime, $1.52½@1.55; other, $1.35@1.40; pea, $1.45@1.50; w. kidney, $1.70@1.90; red, do., $1.40@1.70; black, $1.70@1.75.

Receipts of beans for week, 4,116 bush.; exports, 1,300 bbls. and bags.

BEESWAX.—Transactions are limited to small lots for which 24½@25½c. quoted.

BROOM CORN—Stock here is unusually light, not exceeding 1,400 bales and of this about 300 bales are held on account of Baltimore manufacturers. The supply also includes about 400 bales old. This has brought about comparatively full prices. It is not likely that anywhere near present prices could be sustained if several additional car lots should come forward. Quotations are for choice brush at 9c.; choice hurl at 8c.; stalk braid at 6@7c.; mixed red and green at 5@6c.

BUTTER.—A rather weak tone prevails at the close and trade has been dull all the week. Undergrade State cannot compete with fair grades of Western and that troublesome substitute, oleomargarine. Exporters are bidding lower and have been yielded to in many instances, making some addition to sales for Europe. Western creamery only makes 26@30c. A good shippers' rate for other goods is 18@20c. The average standard of State butter has been hurt for show by the long drain that has been made upon tops of dairies. Where these have been largely used up, owners find local buyers hunting up fresh made fine, either State or Western, and taste is generally best suited with the latter.

State pails and tubs, choice, small lots, 28@29c.; fair to prime, 24@27c.; winter made, 25@27c.; full dairies, choice, 26@27c.; fair to prime, 22@26c; firkin dairies, choice, 24@25c.; Welsh tubs (including late made), 25@27c.; poor State 18@19c.; creamery, fancy, 36@36½c.; fair to prime, 27@35c.; poor, 23c.; sweet cream, 33@34c.; Western imitation creamery, 23@25c.; dairy, fresh, 25@26c.; other, 19@24c.; factory, finest, 21@22c.; other, 15@20c.; very poor Western 10@12½c; rolls, 19@21c

Receipts for week, 22,100 packages. Exports, 7,671 packages.

CHEESE.—The stock of strictly fancy is very light and the few holders are not inclined to sell, except at decidedly higher prices; demand is limited to actual wants—otherwise there is not much stir to trade—more on account of the difficulty in getting the low grades which are chiefly wanted. Exports for the week, 33,525 boxes.

Prices are for State factory: Strictly fancy, 14½@14¾c. choice at 14@14½c.; good to prime, at 12¾@13¾c; fair to good, at 12½@14c.; half-skimmed at 10¾@11¾c. State farm dairy: Good to prime 12¾@13¾c.; fair to good at 11¾@12½c. Wis. factory: Fine, 13¾@14¾c.; good to prime 12¾@13¾c. Ohio factory: Cheddar, fine, at 14@14¾c.; do. fair to good, 11¾@12¾c.; flat, fine, 13¾c. flat, good to prime, 12¾@13¾c.; flat, fair to good, 11¾@12¾c.; half-skimmed, 11¾@11½c.

Receipts for week, 8,919 boxes.
Exports for week, 25,965 do.
Liverpool cable, 72s.
Steam, 25s.

COTTON has shown frequent changes in prices and a fair degree of activity, closing at for Jan., 12.63@12.65c.; Feb, 12.67@12.69c.; March, 12.89@12.90c.; April, 13.08@13.09c.; May, 13.27@13.28c.; June, 13.43@13.44c.; July, 13.58@13.51c.; August, 13.61@13.65c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—In apples there is less doing in evaporated lots, which can be had at easier prices; other grades are also slow. Peaches remain quiet, and in small fruits there is little trade. Quotations are for apples—New N. C., at 7@8¾c. for fair to good; 9@9¾c. for choice; 10@10¾c. for fancy sliced. Patent evaporated, apples, choice, in cases, at 13¾@14c.; do. good and prime, 12¾@13c.; N. Y. State sliced, new, 7¾@8c.; do. quarters, 6¾@8c.; new southern quarters scarce and nominal; new North Carolina peeled peaches 17@18c., do., Georgia, 13¾@16¾c. Peaches—Delaware evaporated, peeled at 24@28c.; do. unpeeled at 13@15c.; new halves at 8@8¾c. Blackberries at 9@10c. for new. Raspberries at 25c. Pitted cherries at 18@19c.

EGGS.—Receipts for the week, 3,900bbls.; do. last week 4,585 do. Light recipts fail to animate the market; steady business can not be looked for while long held stock makes the formidable obstruction that has distressed the market all the season. Limed eggs weak at the low figures.

Tennessee eggs, 16@16½c.; Near points 20@21c.; State and Pa., 17@17½c.; Western, extra, 17c.; fair to good, 15½@16c. Southern, fresh; 16½@17c.; limed, State, 12@13c.; Canadian, 11½@12½c.; Western, 11@12c.; hold eggs, 13@15c.

FLOUR.—This has been a very dull week and prices have been declining. The situation of the grain markets, with large supplies held West and here and the downward course of prices together with the apathy of exporters tend to the reduced prices for flour.

Latest prices are $4.65@$5.85 for inferior to very choice superfine State; $5 35@5 50 for inferior to good extra do., odd lots and lines; $5.50@5.85 for very good to very choice do.; $4 65@5.35 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $5.30@5 50 for inferior to good shipping extra do., and $5.50@5.85 for good to very choice shipping extra do.; inferior to about choice white wheat extras, $5.65@6.60 choice to fancy do. $6,65@8.00; red and amber winter wheat, inferior to fancy trade and family, at $5.80@7.50; round hoop Ohio, $5.50@6.85; and trade and family brands of do., at $6.00@7.00; the latter rate for fancy; St. Louis at $5 75@6.50 for inferior to good extra; $6.50@8 00 for good to fancy; Minnesota clear, very inferior to fancy, at $5 60@6.60; Minnesota "straight," very inferior to fancy, at $5.00@7.75 and patent inferior to very fancy, at $4.65@8 75; unbound stock at from $3 2½@5 50; city mill extra at $6.40@6.75 for fair to very choice for West Indies (fancy do. quoted at higher figures); do. for England, $5.35@5.75 for poor to choice; do. trade and family extras, $6.75@7.75; do. for South America, $6.60@6.90; No. 2 at $3.65@4.35 for poor to choice.

CORN MEAL.—Sales at $3.30 for Brandywine; and $2.50@$3.10 for yellow Western.

FURS AND SKINS.—At the London sale of Jan. 20th, American skins showed some advance. The effect has been good here, and next week we will quote a revised table.

FRESH FRUITS.—Exports of apples 7,505 bbls. Some boat parcels of apples are turning out better than stored this winter. Trade at present is a straggling one; prices are comparatively easy as few dealers have courage enough to hope for better prices. Cranberries have outside demand sufficient to keep them stiff. Grapes have come to be a nominal affair. Fla. oranges have the old story; arriving in poor order and have to be repacked to make $3 50. Peanuts are selling again. Hickory nuts lower. Charleston strawberries have sold 75c. to $1.00 qt. Fla., 50@75c. do. Spitzenbergs, ₩ bbl., $3@3.50; N. Spys and Seeks, $3@$4. Baldwins, choice, 2.00@$2.75; other, $1.75@$2.25; Greenings range, $1.00@2.00. Cranberries, Cape Cod, fancy, ₩ bbl., $9; other capes and Western, bbls. $6.50@8.50; N. J. crates, $2@$2.75. Grapes, prime Catawbas, case, 2.50@$2.75; poor, 1.75@$2.25. Florida oranges bf. bbl. cases, $3.25@3.50; other, as they run, $2@3.00. Peanuts, Va., hand-picked, ₩ lb 5¾@5½c.; good to fancy, 4@5c. Hickory nuts, 50@75c. Pecans, 10@10½c.

GRAIN.—Wheat has tended downward, and has received very little attention from exporters. The glut in the Western markets, and the inability, in consequence, to move supplies forward from farmers' hands and the very slack export demand, have caused the lower range of values. Latest sales are of No. 1 white at $1.41@1.42; do., January, at $1.41@1.41¾; do., February, at $1.41½@1.42¾; do., March, at $1.43¾@1.45; do. May, at $1.43@1.44; ungraded white, at $1.37½@1.38; No. 2 red at 1.43¾@1.44¾; do. January, at $1.43@1.41; do., February, at $1.44@1.45½; do., March, at $1.45¾@1.47¾; No. 3 red at $1.37; ungraded red at $1.10@1.42. Rye is quiet at 90¾@91 for Western. Corn has been held up better than wheat, as the supplies have been less liberal, yet has not had much export call; latest sales are of No. 2 at 58¾@59c.; do. new, in lots, at 56c.; do., January, at 56c.; do., February, at 55¾c.; do., March, at 56¾c.; do., May, at 55¾@56c.; New York steamer mixed at 58¾@59¾c.; do., January, at 59½c.; do., ungraded mixed western at 55@55¾c.; New York No. 3 at 57¾@58c.; yellow Western and Jersey at 59@60c.; steamer mixed at 58¾c. Oats have been moderately active and easy in price; latest sales are of No. 1 white, at 50c.; No. 2 white at 48¾@49c.; No. 3 white at 47½@48c.; New York No. 1 at 48c.; New York No. 2 at 47¾c.; do., February, at 48c.; New York No. 3 at 47c.; ungraded white western at 48¾@49c.; ungraded mixed western at 46¾@47½c.; white State at 48¾@51¾c.; mixed State at 47c.; No. 2 Chicago afloat, at 48c.

HAY AND STRAW.—Prices are on a good, strong basis. The demand is steady and fair, and receipts moderate. Shipping hay quoted at 75c.; retail lots at 80@85c.; for medium, and 85@90c. for prime; clover at 60@65c. Straw at 90@95c. for long rye; 60@70c. for short rye, and 55@60c. for oat.

Exports for week 2,675 bales.

HOPS.—Emmet Wells, in his weekly circular, says:—"The better feeling noticed in our last has not been sustained, and the hope indulged in by out side speculators and a few "bulls" in the trade that prices would advance immediately after the holidays has not been realized, but has gradually given way to a feeling of disappointment, and, in a few instances to that of uneasiness, as is evidenced by the fact that one outside holder of some 3,000 bales, finding the prospect of an advance anything but flattering, has concluded to unload; not upon this market, but on the London market. The hops in question are of the last growth, and embrace a large proportion of the last 14 days' exports, and, as we are credibly informed, go over on owner's account, not on order. Another thing to add to the dullness of our home trade is the fear produced by the present slim prospects of a good ice crop, and the serious harm that will result to the brewing trade should the present warm weather continue a month or six weeks longer. Ice, of course can be brought from higher latitudes, but only at greatly increased expense. Our revised quotations show a decline of from 3 @5c per pound."

The quotations are for:

	Cents per lb.
New York, new crop, choice	33 @35
New York, new crop, medium	30 @32

Imports for the week	19
Total imports for the season	1,027

OIL-CAKE.—Western is quoted at $34 per ton.

OILS, American Essential.—The stock of peppermint is only of retailing quantity; prices firm; no can or export lots; glass brands, $3.25@$3.50. Spearmint, $2.25 Wintergreen, $2.50. Tansy, $2.50. Wormwood, $5. Sassafras, 55c.

POULTRY AND GAME.—Prices for dressed are quoted easy, but considering the fact that many shipments at this part of the season are made up of the rough remnants of coops, quotations are fair. As we have remarked, there is not much room for other than near-point stock. Light turkeys and chickens of uniform size have the steadiest sale. Squabs have advanced.

Turkeys, N. J., 12@13c.; State, Mich., Ohio and Penn., 12@12½c.; other Western, 9½@11c.; Philadelphia dry-picked, 13@14c.; do. chickens, 12@13c.; N. J. do., 11½@12c.; State and Western, prime 10½@11c.; poor to fair, 5@8c.; Phila, fowls, dry-picked, 10c.; N. J. 9@10c.; poor to prime other, 6@9c. Ducks, choice, 13@14c.; other, 10@12c. Geese, choice, 11@12c; N. J. and State, 9@10c.; Western, 8@9c. Squabs, white, ₩ doz., $4.00; dark, $2.50. Capon, large, ₩ lb 20@21c.; small and slips, 16@18c.

A light supply of live have given a firm tone to prices fowls and chickens, but liberal receipts are on the way and quotations may suddenly change.

Fowls, 10@12c.; roosters, 5@6c., turkeys, 10@12c.; ducks, 55c.@87c.; geese, extra, $1.75@1.87; other, $1.12@1.50.

Supplies of game are extremely light, not more than filling hotel and supper orders. Market firm for all sound items.

Canvas back ducks, Havre de Grass, $2.50@2.75; Norf. and Western, $2@2.50; red head, $1@$1.25; Mallard, 70@80c.; Teal, 40c.; common, 20@40c., quail, $4.00; partridges prime, $1.37@1.50; other, $1.12@1.25; grouse, $1@1.25; wild pigeons, flight, prime, $1.50@1.75; acorn fed, $1@1.35; rabbits, 3@40c.; hares, 35@40c.

PROVISIONS—Had less export demand, and closed for pork at $13.35@13 40 for new mess for January; $13.35@13.40 for do for February; $13 40 for do. for March and $13 45@13.50 for do. for April. Bacon at 7½c. for long clear and 7¾c. for short clear. Lard—Western steam at $8 for spot lots; $7.90@7.92½ for February; $8 for March and $8.07½@8.10 for April. Stearine at ¾@ for Western. Tallow at 6¾@6¾ for prime. Beef Hams at $16.50. Beef—Extra mess at $11@12; plain mess, $10.50@11; packet, $13@13.50; tierced beef, city extra India mess, at $21.50@23, and Philadelphia do. at $21.

Receipts for week, pork, 2,075 bbls. Beef, 860 pkgs. Cut-meats, 31,850 do. Lard, 8,150 do. Dressed hogs 4,750 do.

SEEDS.—Grass are lower, especially clover, which is in very fair supply and but little wanted: clover quoted at 7¾ for prime Western, 8@8¾ for choice, and extra choice do. and State at 8¾@8¾. Timothy at $2.75@3. Flaxseed is dull at $1.70@1.75.

TOBACCO.—Export demand is moderate, and prices are unchanged.

FEED.—Sales of 40 to 60 lbs. at $19.00@$20.00; 80 lbs at $20.00; 100 lbs. at $21@$22; Sharps at $21@$23.

VEGETABLES—Exports for week 3,474 bbls. potatoes; of onions 105. The demand for potatoes is good and the late demand is well supported. Texas is quite a buyer this season. Prices are deemed fair under the remarkably open season, which admits steady railroad deliveries. Some boat lots are sprouting. Sweet in light supply but equal to current wants. A few Fla. green peas have appeared but did not attract a buyer. Norf. Spinach, 1.50@$1.75 bbl.; Baltimore do. $1@$1.25. Onions firm.

Nova Scotia E. Rose, bulk bbl. $1.75@$2.00; do. Prolific, d. h., $1.50@1.62; do. LIVE STOCK MARKETS.

NEW YORK, Saturday, Jan. 24.

BEEVES.—Receipts for the week, 13,783 head; do. last week, 14,428 do. Heavy receipts with the mild weather have kept the daily markets depressed. Compared with Wednesday's market cattle were sold $1 per head lower. Oxen and dry cows sold at 6¾@7¾c., poor to fancy steers, 7½@8c.; sales largely at fractions each side of 7c. Export demand good.

MILCH COWS—Receipts of over 200 head are greatly above winter wants here and quotations with small sales are weak at $60@$90 per head. An extra milker might do $5 or $10 better; but most of the quality now arriving is regulated very much by beef quotations.

SHEEP AND LAMBS.—Receipts for the week, 26,258 head; do. last week, 29,943 do. There has been a fair steady trade and the market closes firm. Sheep quoted at $4.65@$5.65 per 100 lbs. Lambs 6.75@$7 the latter for Canada.

VEAL CALVES.—Dressed, dull, must be in perfect order to bring 10c. Coarse, heavy, live, dull; fine quality sell readily at the extreme. N. J. and Bucks Co. live, choice, 8c.; other, 6½@7c ₩

Mount Holly stock, 300 lbs., down, 5@8¼c. Hog-dressed, choice, 10@10½c.; other, 8@9½c.; buttermilk, calves, 4@5c.; grass, 2½@3¼c.

SWINE.—Receipts for the week, 31,039 head; do last week, 30,614 do. Live firm at 5@5½c. ₩ lb., corn fed; swill sold at $4.93½ per 100 lbs.

Light country pork, 6¾@7c.; medium, 6¾@6½c.; heavy, 6@6¼c.; Western dressed, 5¼@6c.; city, dressed, 6¾@6¾c. Pork tenderloins, 11c.

Reading for the Young.

FLORICULTURE FOR YOUNG PEOPLE—NO. II.

JOHN N. DICKIE.

IN the RURAL of December 13th, I told you how to sow flower seed in order to have the best of success. The next thing is the selection of varieties; for, without a proper knowledge of the numberless sorts advertised in our catalogues, a very unwise selection might be made. To tell the exact truth, but a small per cent. of our annuals are capable of giving general satisfaction, although they will always be of interest to the florist. What the great majority want in a flowering plant is good color, neat habit and prolonged bloom; and in the following descriptions I shall conscientiously endeavor to give you the cream of the great tribe of annual flowering plants portrayed in the catalogues of our seedsmen. First, then, upon the list, let us place

PHLOX DRUMMONDII.—This flower does not make quite so dazzling a display as a bed of Geraniums, but it far surpasses that popular bedding plant in delicacy. Do not sow the seed too thick. Let the plants stand one inch apart in the seed bed, and water well. Transplant to the permanent bed from the 5th to the 10th of May, setting one foot apart, no more, no less. Buy seed of mixed varieties the first year, which will cost you ten cents, and produce from one to two hundred plants, which will bloom until after light frosts, provided you keep the seed-pods cut off. As a rule, you will always have better flowers and more continued bloom, by cutting off the blossoms as they fade. Those varieties from which you wish to save seed can be grown in some retired spot.

PORTULACA.—Often called "rose moss." Well known, but positively unequaled for brilliancy of color. Keep the soil damp with a little moss until the seeds start. Set the plants six inches apart. The double rose flowered will keep in bloom nearly all day, and is very desirable. From a paper of the seed you will probably obtain twenty double flowering plants. The rest will be single and semi-double. When, after prolonged bloom, the plants grow long and ungainly, cut back and they will start out anew. No plant bears trimming better, as it can be cut into any shape with impunity.

PETUNIA.—For a constant, brilliant display without extra care and attention, this flower excels any annual with which I am acquainted. Seed of the common sorts of blotched and striped costs ten cents a paper, while the more fancy sorts are twenty-five cents. Begin with the inexpensive kinds. They flower more profusely, and make a better display. Set 18 inches apart; a packet of seed will furnish plants enough for a half dozen beds. I have planted them along a fence and had it completely covered by September, making a most beautiful picture; but the soil must be very rich to produce this effect.

POPPY.—Don't laugh, dear young reader, for a bed of poppies properly attended to, is a dazzling sight, and will attract general attention—as much so as anything in your gardens. Having a taproot it will not transplant, and the seed must be sown in April—surely by the first of May—in the beds where they are to bloom. Thin out the plants to one foot apart as soon as they appear. When they begin to bloom do not allow a single pod to form under any circumstances. From neglect of this caution poppy beds are not worthy the name longer than two or three weeks: whereas, by not crowding them, and renewing all faded flowers, they will blossom from two to three months. The large flowered sorts are the best, of which I name Double Oplum Poppy, Mursell and Paeony flowered. Now don't neglect this flower because it is old-fashioned. You might just as well refuse to sing Old Hundred. Try a bed next spring and report results.

SALVIA.—A great many imagine they cannot grow Salvia from seeds, simply because it is grown largely by florists. This is a mistake. For ten cents you can purchase a package of seed sufficient to plant a large bed. For fall flowering there are few plants that equal Salvia splendens. Seed germinates rather slowly. Set two feet apart, if the soil is rich. You can let the seed form on this as the Petunia, as they are both persistent bloomers.

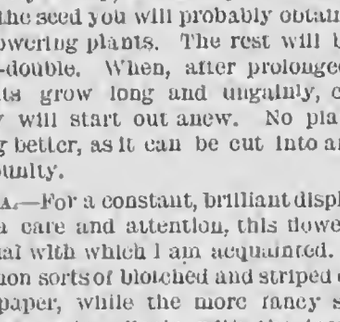
Morrow Co., Ohio.

[These are a few of the most desirable of our many beautiful annuals which ought to be found in every garden. Now is the time to select seeds, and lay plans for the coming summer. I advise the members of the Horticultural Club to send for catalogues of the different seedsmen they see advertised in the RURAL, so that they can be prepared to make a wise selection of seeds; meanwhile, I hope to extend the list of such plants that are especially desirable and suitable for their gardens. UNCLE MARK.]

A HERBARIA PRESS.

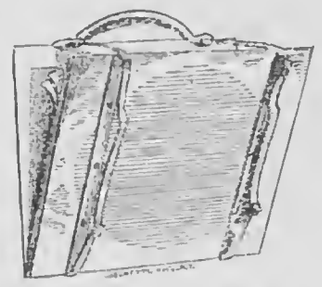
PROBABLY no premium that we have heretofore offered will prove so acceptable to the cousins as

No. 1.



this plant press, and especially will all who are at all interested in botany, regard it with great favor. The young botanists of the Horticultural Club can here secure a neat and excellent plant press, something which every botanist should have, for a very little trouble. When plants are gathered they must be pressed, so that they can be preserved for future reference. This pressing is generally done by laying the "specimens" between the leaves of an old book and then laying a weight upon it, but the press here offered the collector can take with him in the field, and immediately put the plants under pressure while they are yet perfectly fresh. The illustrations give a clear idea of the press. No 1 shows it as it appears when shut, and No. 2 when it is open.

No. 2.



The outside is made of perforated or slotted birch board. Inside of these boards are placed thick sheets of bibulous paper, which will thoroughly extract the moisture from the plant or leaf. The whole is fastened together with strong straps which can be drawn as tightly as may be desired. A leather handle, similar to that of the ordinary valise, makes it easily portable. We offer this press for a club of six subscribers.

LETTERS FROM THE COUSINS.

A New Uncle.

UNCLE MARK:—I request the privilege of becoming a member of the Horticultural Club. I am aged, but as you accept of aunts, why not uncles? I was unfortunately injured while in the Union Army of the Rebellion. Previously my life was a very active one, both physically and mentally, and a life of inactivity would now be to me a life of misery. I have been very feeble for several years past. I have spent my time wholly in my garden, when the weather permitted, and I was not confined in the house in pain and sickness. My work there has so far been a pleasant, profitable and healthy pastime. I was born and bred and spent my time in a city, the first thirty years of my life, in mercantile pursuits, and I was educated accordingly, so you may be sure I am very ignorant of horticulture. I read some time ago in the New York Tribune, that my namesake, Secretary Thompson, commenced at 60 the study of Greek and Latin. Why not I, at the same age, study horticulture? I have a large garden; one-sixth of an acre for onions; space allotted for two to three thousand cabbages, and besides potatoes, sweet and common corn, and culinary vegetables of all kinds; a Wilson strawberry plat; and three to four hundred Catawba, Isabella, Concord and Clinton grape vines. I have had it so arranged since my discharge from the army, as I was not able to do much work myself, that most of the cultivation can be performed by a horse.

I was not prepared for the seed distribution of last year, so was very unfortunate with them. I am proud of the Acme tomato and the Beauty of Hebron potato. This fall I have had a team of oxen for half a day, breaking up fresh ground, and as the weather was so very favorable, I am now well prepared for experimenting and growing flowers without interfering with our regular crops.

There are three large rocks near by one of the entrances of my garden, with a space between two of them large enough for a summer-house, or arbor. I intend to build one there similar to the one in the birds eye view of the Experimental Grounds of the RURAL. I wish you to be informed that I am a lover of nature, to the extreme of adoration, and that I live in a beautiful and romantic place, under High Point, one of the high mountains of the Catskill range. Behind my house the rocks are seen towering more than one hundred feet in hight, and in some places they rise forty to sixty feet perpendicularly. In front between my house and garden there is a deep rocky ravine, with rocks in fantastic shapes, precipices perpendicular, forty feet and more in depth. My home looks small, surrounded with this precipitous grandeur; and when clothed in the garniture of autumn, in golden and bronze, green, red and purple hues, harmonizing with the neutral tints of the bare and mossy rocks, it portrays a beautiful and romantic sight. All who love the beautiful and romantic would not be content with those three naked rocks at the entrance of the garden; they would want them clothed to correspond with the rest of the scenery and that is just my feeling. I have improved them, some little in my sight, by heaping a lot of knarled roots upon them. My neighbors talk to me of blasting them out; but I love nature to much in its wild ruggedness, to commit such a sacrilege. I would rather see a rural gate, a flower plot, a rustic arbor, and the rocks clothed with ferns and creeping plants.

City bred and educated as I was, my knowledge is too limited to proceed to clothe those naked rocks to make them harmonize with the rest of the surroundings, hence I have to appeal to you for assistance; for which I shall ever be grateful.

Ulster Co., N. Y. JOHN THOMPSON.

[You are very welcome to join the Horticultural Club. Your age and experience will certainly enable you to give the cousins much sound advice, and your appreciation for the beautiful in nature will lead you to point out the beautiful to them. As to the manner in which you can best cover the large rocks you mention, I should venture an opinion more confidently had I seen the rocks and surroundings. I would recommend to set some plants of the Virgina Creeper, Clematis, Dutchman's Pipe, and other vines round about them; these will soon cover them with a profusion of green. Or, if the place is not too exposed prepare the soil and plant some Grapevines to cover the rocks, and thus make them useful, as well as ornamental. A wire trellis can be stretched over them to which the vines may be tied.—UNCLE MARK.]

DEAR UNCLE MARK:—As I like to read the letters from the Cousins in the RURAL, I will write one, too, asking if I may join the happy band and become a member of the Horticultural Club. I am ten years old, and go to a school, about three quarters of a mile distant. I am very fond of flowers and we have a good many house plants some of which are in bloom. Among them are a Calla and several Geraniums, both red and pink, and an Oxalis that blooms the most of the time. We also have a nice Oleander, but it has never blossomed and is about three years old. Will some one tell me how to make it blossom? This being my first letter to you I will not make it too long; but if I see it in the RURAL I may write again. So good-bye, with love to all the cousins, I remain one of them. ESTELLA.

Southington, Conn.

[I shall be glad to put you on the list when I get your full name.—U. M.]

The Puzzler.

HIDDEN MEN OF PROFESSIONS.

1. 'Tis evident I struck her.
2. In law ye resign.
3. The Modoc torments his victims.
4. With physic I annoy.
5. To leg is Latore's failing.
6. As I fell a stud entered my eye.
7. How late a cherry tree bears?
8. Tut, tut, Orlando!
9. I saw this Toria no more.
10. Ibo, tan is the stuff to cleanse hides.
11. George Olog is through.
12. Tell me the fact Orsina?
13. You are a perjuror.
14. It broke Ruth's heart.
15. You know our big ram, ma, Rian had?
16. The music I announced.
17. What a bump I received!
18. That torn eyelid is inflamed.
19. By her bib Lio, grap her.
20. Do survey Ernest's farm?
21. Min! is "terra" earth?
22. Do you the treasure receive?
23. To join the clergy, manage well.
24. Ned, I tormented him.
25. That journal is trashy.

Sabbath Reading.

SPEAK SOFTLY.

SPEAK softly, gently ever!
There is no wiser part;
For harsh words pierce like steel
The yearning, loving heart.

As gems reflect in brightness
Every flitting beam,
Let words reflect in kindness
Love's sunny, love-lit gleam.

Speak softly, gently, ever;
There is no better plan—
For angry words can never
Effect what kind ones can.

For, O! a soft word spoken
May move the stubborn soul
That still would prove defiant
Should words of thunder roll.

Speak softly, gently ever!
Words breathing nought but love!
And soon our blighted Eden
Will bloom as realms above.

THE ENJOYMENT OF THIS WORLD.

THAT the things of this world afford a certain degree of pleasure is testified by all who possess them, whether they be Christians or not. But that they confer no great happiness is equally the testimony of all; and those who possess most of them are often most sensible of dissatisfaction and want. This arises in part from their nature; it is not possible that perishable things should feed the hunger of an immortal being. Yet there can be no doubt that, should we acquire them and employ them in the best manner, we might enjoy them far more than we do. Why is it that we find in the ordinary gifts of Providence so little happiness?

One reason may be superstitious conviction that God will be displeased. There are many who fear to rejoice in riches, lest God become jealous. But there may be an enjoyment of the world wholly in accordance with His will. Paul assured the people of Lystra that He filled the heathen world not only with food, but also with gladness. The same apostle directed Timothy to teach the rich that God gave them all things richly to enjoy. There is no necessary antagonism between the things of this life and the God whose power creates them and whose providence bestows them. Only when we worship them as idols, or use them as screens to shut His glory from our eyes, do we provoke Him to anger. But this is not the way in which we may best enjoy them.

Another common reason of our failure to enjoy the world may be found in our envy of others who are more fortunate than ourselves. In the presence of their splendor our own disappears from view, like the moon when the sun rises above the horizon. It is the story of Haman repeated; we can have no peace while Mordecai is permitted to sit at the king's gate. A wiser course would be to enjoy not only our own possessions, but also the possessions of others. Expelling envy from the heart, we shall perceive that the palace of the rich, built to be admired, was therefore built for us, and we shall enjoy its architecture equally with its owner. We shall be able to thank the millionaire for keeping his spacious lawns, in order that we may feast our eyes on them We shall look at the gems and jewels and dresses of fashion as worn for our inspection, and we shall rejoice in their beauty, and the more that we are not subjected to the cost of their purchase. All things will become ours.

Another reason that we enjoy our possessions so little is that we impart so little of them to those who are needy. Selfishness and happiness are implacable foes; they cannot dwell in the same breast. The riches that we strive to enjoy selfishly are a curse and a bitterness; they fail utterly to bless; they are apples of Sodom, full of dust and ashes, which the hungerer loathes. What we give we most truly gain.

Nor is the highest enjoyment found merely in imparting of our superfluity that whose loss we do not feel. The law of sacrifice is the law of happiness. Not until we give so largely as to become conscious of want, do we reach the greatest joy of giving. And in a world where there is so much misery, both of body and spirit, it is possible for even the most wealthy to attain this happiness of sacrifice.

The only other reason of our failure to enjoy the world of which we care to speak at present may be found in our failure to enjoy the hope of bliss in the world to come. There is no antagonism between worldly joy and spiritual joy. Nay, the latter increases the former. The man who regards his money only as a means of present gratification does not derive from it a tithe of the satisfaction which would come to him did he believe that he may lay it up in heaven for eternal use, that he may make friends with it who shall welcome him to everlasting habitations. The joy of the spiritual life does not eclipse the joy of the earthly life; on the contrary, did we live as we should, the one would rather illume the other, and make it more conspicuous, as the sun lights the earth, and reveals its beauty. The man who knows not God knows not how to employ His bounties in such a way as to derive from them the highest satisfaction.—*The Watchman.*

HE who makes the fullest use of God's gifts is their real owner, for property does not become possession until the proprietor becomes the master.—S. S. Times.

To forgive our enemies, yet hope that God will punish them is not to forgive enough. To forgive them ourselves, and not to pray God to forgive them is a partial piece of charity.—Sir Thomas Browne.

PERSONAL ITEMS.

Senator-elect Garfield once drove a canal horse, and could whip any man on the route.

By the will of the late Frank Leslie all his real and personal property is bequeathed to his widow.

General Sherman is said to be the most persistent theater-goer of all the public men in Washington.

The Lord Mayor of London gives a bond of $50,000 for the safety of the official diamonds, and one of $100,000 for the safety of the plate.

President Lincoln once said that some people not only believed that the earth moved on its own axis, but that they were the axis.

A bitter correspondent writes to the London News that "Swinburne" signifies "pig's brook," from "swin," a pig, and "burne," a brook.

Algernon Sartoris, the English son-in-law of General Grant, has arrived in this country, but Mrs. Nellie Grant Sartoris does not accompany him.

Lieutenant General Skobeloff, inspector general of the Russian cavalry, father of the General Skobeloff who distinguished himself in the Russian war, is dead.

Governor Williams, of Indiana — the "Blue Jeans" of the whole country—had a family reunion on Friday week, his seventy-second birthday. Six grandchildren were present.

Ex-Governor Garcelon, of Maine, whose action has produced the present muddle in the Pine Tree State, is 72 years old, and has an excellent reputation as a doctor and a man.

Mrs. J. J. Astor has just sent one hundred more of the homeless children of New York to homes in the West and South, at a cost of $1,500. During the last seven years she has found homes for six hundred and seventy-seven poor lads and has expended on them $9,750.

A wealthy man who lived in Chesterfield, Va., had two sons. Tom and Jack, both found of playing poker, but Jack was very sharp and Tom very flat. When the old man died he left Tom $90,000 and Jack only $1,000, but he explained at the foot of his will that $1,000 was just stake enough for Jack to win everything that Tom had; and so it turned out.

Ouray, the Ute, is short and stout. He has a square face, and wears a high hat. He has somewhat of a beard. He speaks Spanish well. General Adams says that Ouray is a man of intelligence, but that when he was told that the Utes acted badly he smiled, shrugged his shoulders, and merely said that it is only a way the Indians have.

Senator-elect Mahone, of Virginia, is a small, slim man, with bright eyes and quick movement. As a Confederate leader he was famous for his daring. He never wore a sword while in command, always forgot his pistol, and went into action with nothing in his hands or in his pockets, wearing generally a loose blouse of gray flannel, which his soldiers called his "fighting jacket."

Julia Jackson, the sixteen-year-old daughter of Stonewall Jackson, was presented at Baltimore, on Christmas Eve, with a silver pitcher, inscribed, "To General Stonewall Jackson's daughter, from Confederate soldiers in Maryland, Christmas, 1879." The presentation was made in a quiet manner at Miss Cary's school, where Miss Jackson is a pupil. Mrs. Jackson was present.

Mrs. Grant is said to be very fond of collecting pictures of herself, Ulysses and the children. She gets every photograph she can and carefully puts it away for future use. When fixing up her house at Galena the other day, she hung up Ulysses and the children in nearly every room. The little General, observing the redundancy about the house of Grant and the little ones, removed his cigar from his mouth long enough to observe "it was in bad taste," whereupon the good wife gave the man of her destiny to understand very plainly that it was *her* house he was talking about, and she would not be told how she should fix it up.

Lieutenant Gorringe has found under the pedestal of the obelisk that is coming to this country several Masonic emblems of great historical value. A perfect Masonic altar, a Masonic apron, and so on, are represented on blocks of hewn Syenite granite. General Roome, the Grand Master of Masons in New York State, says that the discovery will be a great thing for Masonry. It is claimed by many Masons that the society sprang from the Essenes, who wore the arc of three secret societies among the Jews. John, the Baptist, belonged to the three, and it is supposed, also, that Christ was brought up within their mystic rules.

Ask any good doctor if Hop Bitters are not the best family medicine on earth. See notice.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

Various.

BRIEFLETS.

THE expediency of creating a Department of Agriculture and Commerce is a question in which every farmer should feel himself deeply interested. . . Speaking of possible troubles in Europe, Nation says: But Germany, too, is full of trouble, and her fighting chiefs are pretty old, or very rheumatic, gouty, and neuralgic. Neither the emperor, nor Moltke, nor Bismarck is physically equal to the strain of another great war. . . In politics, the hardest thing to find is the "best man." . . "Probably no single consideration operates so powerfully to deter cultivated and refined gentlemen from entering political life as the knowledge that nobody who seeks office can escape being treated like a blackguard."—N. Y. Tribune. . . In the catalogue of E. & J. C. Williams is an original engraving of a Raspberry (the Montclair), which is *actually true to life!* The oddity of the thing is what we call attention to. The raspberry, however, is not for sale yet. . . Agricultural journals are now expressing their sincerest thanks for the generous support they have received during 1879 and, as an evidence of their gratitude, only ask that the support may be doubled or quadrupled for 1880. . . That the hog, as we usually see him, is a grunting, exacting, selfish brute, it is impossible to deny. But wilfully dirty in his habits, he certainly is not. Ag. Gazette. . . Messrs. Read and Pell have had "an arduous pilgrimage through America". . . Quinine is now recommended as a specific for Whooping Cough. . . Life spared, we shall *begin* our Seed and Plant distribution on or before February 10th. . . One evil deed will spoil a whole life, as a drop of ink will discolor a goblet of water. . . This is leap year, but look out before you leap, Herald. . . The Detroit Free Press says that although fences do not walk, they have a swinging gate. . . There is nothing better than shallow boxes in which to sow seeds. Let them be three inches deep, with a crack or so in the bottom for drainage. Fill them with *light* soil. Leaf mold from the woods, mixed with sand, is excellent; or sand and thoroughly rotted stable manure. Fill the boxes to within half an inch of the rims. Pat down the soil to an even surface, and then sow the seeds. Sift soil over them just so as to cover, and pat down lightly again, watering only when the surface shows signs of drying out. Keep the boxes in a temperature as near 65 deg. as may be. . . On the 22nd of February, it will be fifty years since Philip R. Freas pitched his tent in Germantown. The Old Telegraph has since been published every week, and edited by him through sickness as through health. . . The Michigan Farmer says that D. M. Ferry & Co. the seedsmen of Detroit, have just erected the largest seed store in this country, if not in the world. . . M. Nicholas de Nasattine says that the aroma on fruit increases with the latitude, while the sweetness decreases. Northern trees have flowers and foliage of vivid colors, and herbs of the North contain more essential oil than those of the South—all this being due to the prolonged light of summer months in Northern climes. . . Buckwheat straw, which has heretofore been considered of little value, has of late been utilized by some of the Western farmers by chopping it fine and adding meal to it. A small quantity fed to stock occasionally would be relished, no doubt.

Wit and Humor.

A boy at the dog show demurely inspected the blacks and the blues, and the bigs and the littles; then said, in a voice that was low and dejected, "Oh, cracky! My eyes! What a place for tin kettles!"

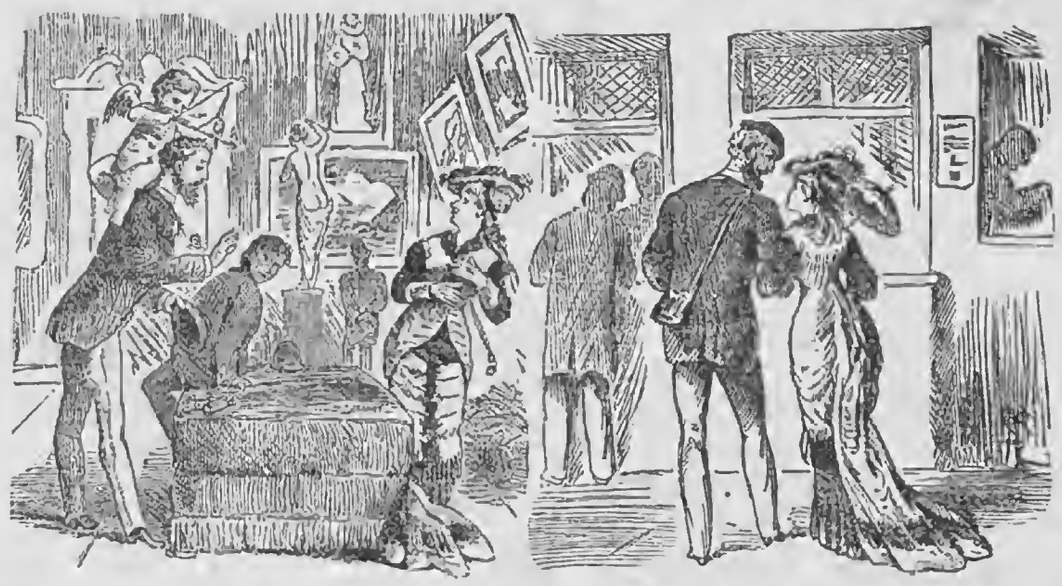
A DILEMMA.—'What are you puzzling over, Pousonby?' 'I'm trying to answer a note from the 'dear duchess,' as you call her. She's done me the honor to write and ask if that St. Bernard pup I gave her should be fed on meat or biscuits?' 'Well, biscuits, shouldn't it?' 'Of course. But she spells biscuits with a k, and I don't like to spell it properly for fear of hurting her Grace's feelings; and yet I don't want it to get about that I spell biscuits with a k,' 'Say meat, then!' 'But she spells meat with two e's!'

RECENTLY a tenant entered the office of a Tipperary land agent, and throwing a roll of notes on the table exclaimed: 'There's ivery penny i've got in the world. "It's a year's rint, and ye may take it or lave it—if ye take it, I'll go to the workhouse; if ye lave it, I'll go to Ameriky on it. The agent opened the notes and counted the money. 'Why, my good man, there is more than a year's rent here. There is over four year's rent in the bundle.' 'The devil there is,' cried the tenant putting his hand in his pocket—'begor, I gev you the wrong bundle of notes after all.'

MISCHIEVOUS CUPID.

1. He is fascinated with the painting, and sits down to regard it with ease. (Cupid determines to make a match.)

2. For a better view he leans back and raises his glass, to the discomfiture of the lady behind. (Cupid chuckles at the good beginning.)



3. Great astonishment of both parties; he apologizes profusely. (Cupid straightway sends a piercing arrow right to her heart.)

4. The explanation is accepted, as is his arm, and happiness dawns upon the couple. (Cupid is satisfied and becomes invisible.)

CATTLE SHOW PRIZES FOR 1880.

CATTLE.

FOR the bull that has behaved with the greatest discretion in a china shop.

For the bull that has allowed itself to be taken by the horns with the least resistance.

For the cow that has accomplished the highest approximate jump to the moon. (N. B.—Jumping every day at two.)

For the finest pair of calves. (N. B.—Footmen are not eligible for this Prize).

SHEEP.

For the pen of sheep that have suffered themselves to be most easily fleeced.

For the best battering ram.

For the most sheepish sheep.

For the sweetest sheep's eyes.

For the flower of the flock.

PIGS.

For the sow with ears best adapted for the manufacture of silk purses.

For the litter most contented either to go to market or to stay at home, to eat roast beef or to have none.

For the least pig-headed pig.

For the "fattest hog in Epicurus' stye."

For the biggest bore in the place.

IMPLEMENTS.

For the "Elevator" best calculated to raise the spirits without causing inebriation.—Punch

Right and Left

Paralyzing blows are being dealt at disease by the great tonic and regulator, Hostetter's Stomach Bitters. Fever and ague, general debility, rheumatism, nervous ailments, constipation and dyspepsia, are among the maladies for which experience has proved it a specific. Its work is thorough, its effects are prompt. It is not, however, advertised to produce immediate cures, though it affords speedy relief, and will, if given a reasonable trial, such as any standard remedy deserves, root out the maladies to which it is adapted. In emergencies arising in families it is particularly serviceable, and is esteemed throughout the land as a medicine of comprehensive uses, wholesome vegetable composition and objectionable flavor. It has risen to popularity by purely legitimate means, and only substantiated facts are alleged in regard to it. Use it systematically.

Reliable SEEDS

Doura, Cow Peas
Prickly Comfrey, &c.

Our seed catalogue containing description, prices, &c., of above will be sent to all who apply, enclosing stamp. R. H. ALLEN & CO., P. O. Box 376 New York City.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXIX. No. 6.
WHOLE No. 1567.

NEW YORK, FEB. 7, 1880.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker Company, in the office of the Librarian of Congress at Washington.]

The Vineyard.

THE EUMELAN GRAPE.

J. T. LOVETT.

THIS Grape, which originated at Fishkill, New York, and was purchased in 1866 by that hero of American Grape Culture, the late Dr. C. W. Grant, (by whom it was subsequently disseminated), is not, although generally supposed to be, (which is quite natural owing to the fact that it has been stated as such in various treatises on American Grapes) a variety of the Fox Grape, (*Vitis Labrusca*), from which the majority of the varieties cultivated at the North have descended; but a variety of the Summer Grape (*Vitis æstivalis*). And there are few Grapes about which there is such a wide disagreement of opinions regarding their value—(which by the way is more or less the case with all varieties of the species) and said disagreement in all probability will ever exist so long as does the variety. This is readily accounted for from the fact that it behaves so vastly differently in different situations, even within a short distance of each other. In a word, it is a most precarious variety, as much as or more so than the Triomphe de Gand and similar varieties of the Strawberry. It is exceedingly handsome; very early, and as its name implies, ("Good Black") is of extremely high quality, "when," one would say, "you can get it." It is so rich in sugar that it has been reported to have "raisined" on the vine under favorable circumstances; but this I cannot vouch for, never having *seen* it do so. Dr. Grant describes it in his catalogue as: bunch of good size, elegant form, and a proper degree of compactness; berries medium to large, round, black, with a fine bloom, adhering firmly to the bunch long after ripe: flesh, tender, melting, all going to wine-like juice under slight pressure of the tongue; ripens very early (even before Hartford Prolific) and evenly to the center. Flavor pure and refined, very sugary, rich and vinous, with a large degree of that refreshing quality that belongs distinctively to the best foreign wine grapes; all of which I can indorse when the vines remain vigorous and healthy. But I must add, so far as my experience goes, it approaches in the same marked degree, that best of American Grapes, the Adirondac, in the uncertainty of a crop as it does in the quality of its fruit.

There is one peculiarity about the Eumelan that I have never been able to understand—a decided difference in the growth of vines under the same treatment. Instances are known of vines propagated from the same parent vine, propagated in the same way, planted side by side and given the same cultivation and fertilizers, yet one would grow into a large vigorous, fruitful vine and another would make scarcely any growth at all; nor will nursing of any known kind restore such runts to vigor, but invariably, after years of watching and care, they must be dug up and thrown away as worthless. I have thought that the difficulty may arise from the *bud* producing the cane from the eye or cutting, being weak or defective in some other way; but this because I could account for it in no other way. It is simply speculation on my part, and the phenomenon is one that has often puzzled me.

Little Silver, N. J.

THE EUMELAN GRAPE.—I consider this of excellent quality, and where it succeeds well a very desirable Grape to plant. In our light soil here it does not always prove a good bearer, but when it does fruit, it is very fine.

Passaic, N. J. GEO. C. WOOLSON.

A LIST OF GRAPES.—Mr. E. Williams names Cottage, Telegraph, Worden, Concord and Martha as a good list of five varieties of Grapes. To enlarge the list he would choose Goethe, Brighton, Merrimack, Lady, Wilder, Salem, Agawam and Massasoit. We have hopes that Mr. Miner's native seedling Grapes will prove worthy of being added to the above list.

Horticultural.

AN INTERESTING STRAWBERRY DISCUSSION.

New Jersey Horticultural Society.

Fruit Growers in Council.

[Rural Special Report.]

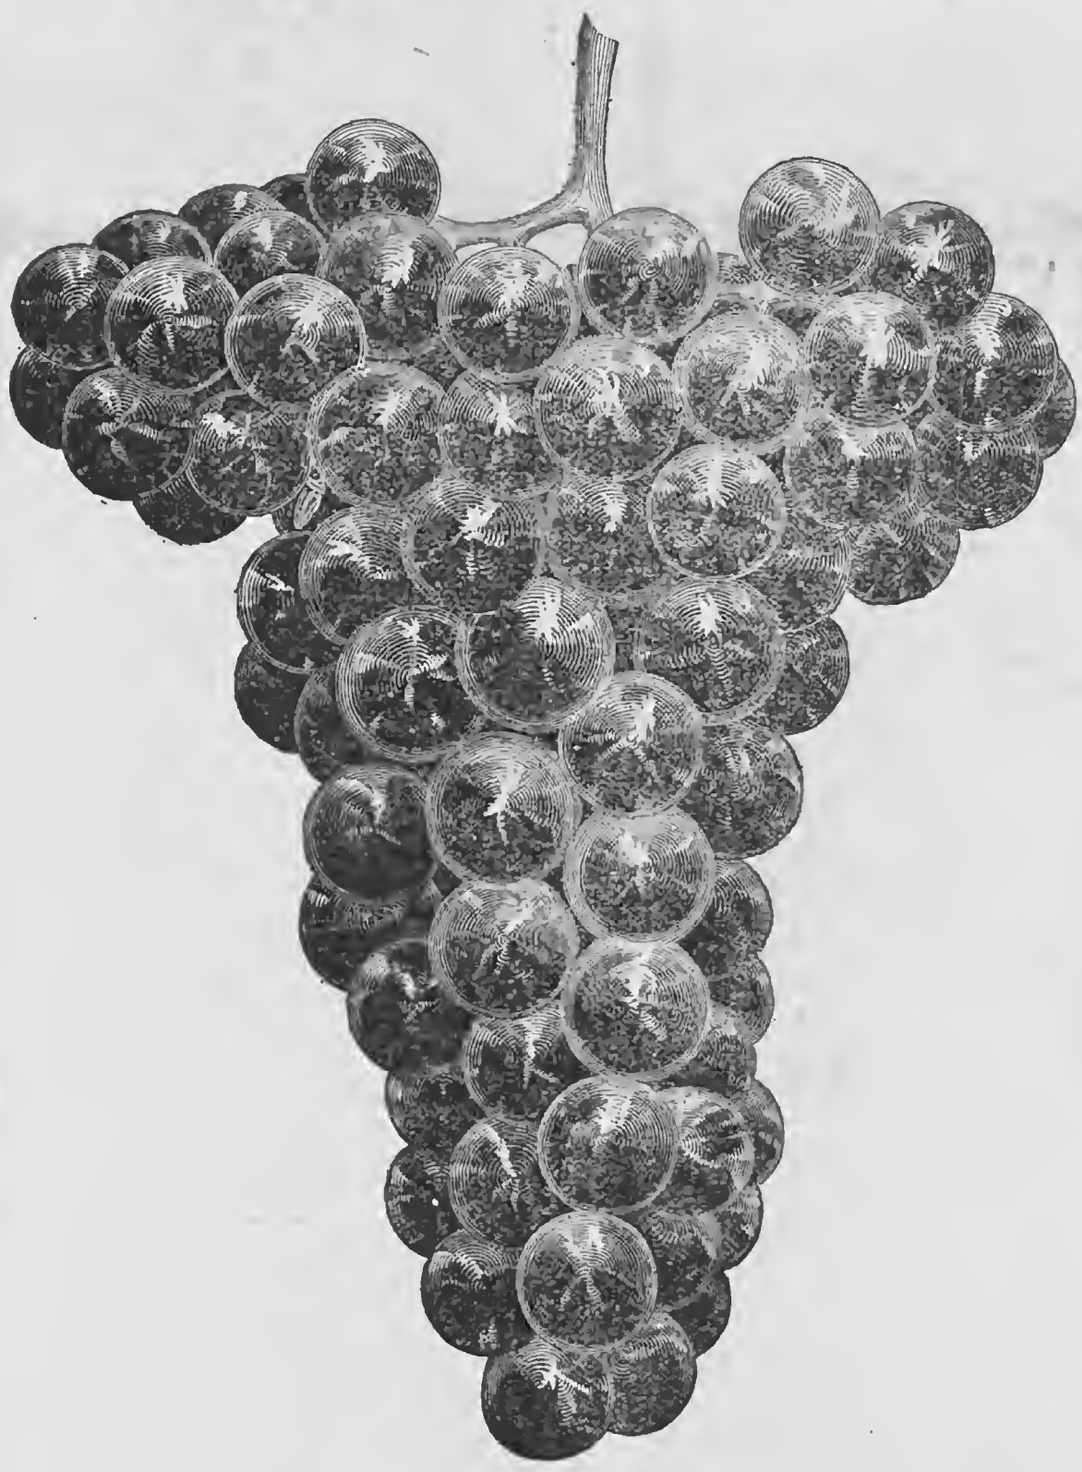
MORNING SESSION.

AT the fifth annual reunion of the above Society at Newark on January 15th, the first question discussed was: "The future of Strawberry Culture as a Source of Profit." The subject was introduced by Rev. J. L. Chapman, of Irvington, a thorough-going amateur. He took his text—a small strawberry plant—in his hand, and commented on its structure, capacity and requirements, and criticized the actions of plant growers for disseminating such quantities of feeble plants as he held in his hand, which was a fair specimen. He urged a reform in growing better plants, charging more for them. The public would be the gainers. To nurse feeble and sickly plants was a waste of time and labor which he could not afford. Less in number and better in quality was his advice.

He advocated high culture and top-dressing to secure a vigorous growth; but when to apply the top-dressing to secure the best results, he was not prepared to say—he was experimenting on that point. Mowing off the tops, as practiced by some, was a questionable practice. In a wet season, it might be of advantage, but in a dry one plants were irreparably injured. A neighbor was growing the Crescent Seedling. "What for," he asked—"to make *sauer kraut?*" No, but because it was productive; could be sold cheap, and people would buy it. It might be so, but he wanted no such fruit.

He thought berries should be graded 1st, 2nd, and 3rd quality, as to flavor, by a competent committee, so that people would know what to plant. New varieties were annually sent out at high prices, many of which, on trial, proved worthless. Any new fruit introduced ought to have a certificate from such a committee. He had tested about a dozen kinds; among them Glossy Cone, Great American Beauty, Black Giant, Pioneer, etc. He thought the coming berry was the Gipsey, a fine-colored berry of good shape, flesh fine and buttery, a beautiful hardy plant, not large enough to suit the prevailing mania, but his wife told him to part with any but that, as she liked it the best of any that came to her table. He advocated thorough preparation of the soil before setting the plants, and clean culture afterwards. He had been troubled with the "grub." Great American had suffered most, and old beds more than new ones.

Mr. Lovett asked if any one had been successful in exterminating the pests, and how?



EUMELAN GRAPE.—Fig. 32.

Mr. Roe would rather have that question answered than any other; he came to learn, and had been much pleased with the remarks of the speaker.

Mr. Crane supposed it was well known to be the offspring of the May beetle or dor-bug, and he would suggest that May was the time when the warfare should commence. He thought we often erred by destroying their enemies. The skunk was one of these, consuming great quantities of insects.

Mr. Hale had used salt as a remedy with partial success. Had hung boards covered with coal tar about his grounds at night and caught quantities of the beetles, but he could not say as to the relative proportion of friends and enemies thus caught.

Mr. Capen, of Boston, would merely suggest that protecting the birds might obviate the necessity of hanging out tarred boards.

Mr. Ward would make a plea for the birds. He thought he had good cause of complaint against damage by cat-birds, yet deemed the benefits generally outweighed the damages. He thought the injury by "grubs" was more apparent among the weak plants than the strong ones.

AFTERNOON SESSION.

The strawberry question being resumed, Mr. Batty of Manchester, by request, gave an account of some of his seedlings. His best was a pistillate variety very robust in habit; berry conical, about the color of Green Prolific, firm enough to stand shipping well, and about doubly as productive as the Wilson, with him.

Mr. Quinn thought a few years ago he knew something about Strawberries, but the views of those days had been somewhat changed by the progress made since. Hovey's Seedling was then considered one of the most profitable till the Wilson superseded it on account of its greater yield and better shipping qualities, but the berry was too sour to suit the public, and the cry among the berry growers was: "Anything to beat the Wilson." The Charles Downing, Boyden's 30, and the seedlings of Mr. Durand, had entirely superseded the Wilson in his vicinity. He believed no finer, larger or better berries were grown anywhere than in Essex county. His most profitable berry was Charles Downing, but some of his neighbors had better success with Boyden's 30. He advocated high manuring—no danger of using too much. He followed potatoes with Strawberries, setting the plants in July, in rows three feet apart. With a favorable season they would give a full crop the season following. He covered the rows with fine manure in winter, and in spring raked off the coarser portion between the rows. He hoed the surface not more than one-sixteenth of an inch deep! (That's getting things down to a fine point!—Rep). By this practice he grew 171 bushels on an acre in 1878; last year the same ground produced 156 bushels. Fifty bushels were formerly considered a good crop; but now less than 100 was unsatisfactory.

Mr. Jones, a neighbor, grew at the rate of 412 bushels in his garden. Mr. Durand had been very successful. His Great American had been the most productive of any variety he ever saw. A Mr. Brown at Middleville had a crop last year that was like apples for size (!!). Green prolific was too soft.

Dr. Hexamer was glad to hear Charles Downing spoken so well of. It was a berry of great intrinsic value. Triomphe de Gand used to pay him the best of any. Cumberland Triumph was a very fine berry, one he could sell any quantity of. Sharpless was the most promising of the new varieties. Champion was also very valuable, in some localities it was very profitable. The New York market was not always a fair test as to the value of a variety. He should prefer locating near a town of a few thousand population, where he could put his fine berries in market and have them consumed the same day they were picked.

Mr. Roe felt amply repaid for attending. He

would indorse all that had been said of the Charles Downing. It grew in favor on acquaintance. He also liked the Monarch very much. If confined to one variety, it would be Triomphe de Gand. Champion was worthy of all Dr. Hexamer had said of it. Sharpless was very promising; so was Miner's Prolific. This was very productive and stood the sun well. He could not distinguish any difference between Champion and Windsor Chief. Golden Defiance was his best late berry. Springdale had always done well. Crystal City was very early. He thought spring cultivation very beneficial; had seen failures where it was omitted. Moisture was essential for success. Irrigation would eventually be practiced.

Mr. Crane had grown Strawberries for 25 years. Had practiced irrigation years ago and prolonged the crop till the 15th of July. Miner's Prolific was appropriately named; its foliage stood well. It was his best variety last year. Charles Downing did not do as well as formerly. Durand's varieties with him were failures.

Mr. Parry approved of what had been said generally. One of the best crops he ever raised was of Boyden's 30 on a piece of ground just suited to them. He was emboldened by his success to plant it largely the next year, and lost all from drought. He cited an instance of a man in Gloucester, who succeeded admirably with Triomphe de Gand by irrigation.

Mr. Collins indorsed much that had been said, especially regarding Charles Downing. Continental was a valuable variety in his vicinity, it pays as well as any of the late sorts.

Mr. Parcell asked if any one had experience with commercial fertilizers exclusively, and got no response save from Mr. Lovett, that he had seen beneficial effects from the use of Mapes's fruit and vine manure.

Mr. Claywood thought there was too much crowding of plants. He advocated hill culture; had used a spoonful of sulphur about the roots of the plants when set, and had had no trouble with "grubs."

Dr. Trimble had never seen such berries in market as the late Mr. Knox of Pittsburg used to send to New York, and they were Jucundas.

Mr. Roe prized it highly. He grew 190 bushels per acre of it last season.

Mr. Ward would speak a good word for the Great American. Though so much had been said against it, with the same culture and alongside the Downing, Boyden's 30, etc., he had realized 50 per cent. more for it the past season.

And thus ended the strawberry discussion. It had covered nearly the whole field owing to the great latitude allowed, and was of much interest; but the main question of "future profit" was not touched upon. If my readers can solve the problem from this digest of the discussions they can do more than I can.

E. W.

EXPERIENCE WITH THE PEA-WEEVIL.—Four years ago my pea seed was so badly eaten by the weevil that I planted double the quantity, to insure a full row. What vines came up were not strong. I saved the first peas on the vines, however, for seed, and tied them up in a sound bag. The next spring I put peas, bugs and all in boiling water for about a minute. The following year I found I did not have half the quantity of bugs, and last spring I found but two in a quart of seed. I live a half mile from any pea-raiser, so that I am not troubled by the immigration from other pea-vines. I think if every one would follow the plan of putting the seed in boiling water, the pest would soon be got rid of.

Field Crops.

EXPERIMENTS WITH TOBACCO.

G. A. GOFF, JR.

WISHING to experiment somewhat with different kinds of tobacco, I procured, last spring, seeds of six varieties, namely:—Havana, Cape, Silky Prior, Ohio Broad-leaf, Lancaster and Chemung Broad-leaf. The seed of the first two varieties was imported; the last three are varieties of the Connecticut Seed-leaf and the Silky Prior is a variety largely grown in Virginia.

The seed was sown in the usual manner, and the plants, as soon as they became of suitable size, were set out in a good, fertile, well-prepared soil. Owing to the dry weather which prevailed during the greater part of the growing season, the tobacco did not make as large a growth as I anticipated. The plants, while growing, received the same care that is usually given them, and when ripe were cut and hung up to cure in the manner followed by tobacco growers here. When the tobacco was thoroughly cured, it was taken down and the leaves stripped from the stalks. The Havana and Silky Prior were planted in adjoining plats of equal size. The Havana from the plat weighed 49 pounds and the Prior 78 pounds, or at a rate per acre of 1200 and 1800 pounds respectively. The other varieties were not weighed. In the quality and size of the leaf as well as in the manner of growth when in the field, there is a marked contrast. The leaves of the Havana are very small compared with those of the seed-leaf varieties, the largest being about 10 inches in length and four or five inches wide, while some leaves of the Ohio Broad-leaf have measured three feet in length and 18 inches in width. The quality of the Havana is good, and when assorted, it turned out a larger percentage of wrappers than any other variety that I have tried. The Cape resembles the Havana, except that it does not grow so tall and has somewhat larger leaves. The Silky Prior is of good quality and runs well as to wrappers, but the leaf is not as fine in texture as the Havana and grows of much larger size.

The other three varieties resemble each other so much that I can detect no marked variations in the quality, the main difference being in the character of growth in the field and the size of leaf, the Ohio Broad-leaf being the largest and most "leafy" variety, and consequently, as it has cured out well, the most profitable kind to grow in this locality. Our crop of 11 acres, grown the past summer, is mainly of this variety, and we have sold it readily for 15 cts. per pound "through." Havana tobacco, to be made as profitable to growers as these seed-leaf varieties, would have to command a much larger price per pound, as the yield per acre is from one-third to one-half less, and the expense in growing it is no less, as it "suckers" more and requires a longer period to bring it to maturity.

Chemung Co., N. Y.

Sorghum in Connecticut.

Some 25 or more years ago, some small packages of sorghum seed received from the Department of Agriculture, were grown here as a curious plant, supposed to be of the broom-corn family. But from that time forward for twelve or fifteen years, no attempt was made to grow it, or until a little excitement grew out of the introduction of some sirup said to have been made from the sorghum cane. The result was the erection of a mill for grinding or pressing the cane, and a large pan of copper for evaporation; and then, some farmers engaged in the cultivation of the crop; but as it was an entirely new thing, and they were wanting in experience, the results were not as satisfactory as anticipated, and yet by no means discouraging. The first sirup was of a very poor grade in comparison with what is now produced. But so favorable was the result that from that time on there has been more or less of sorghum raised here and manufactured into sirup. In some instances the yield has been quite large; but figures are not at hand, except of one case in which 36 gallons of excellent sirup were obtained from 40 rods of ground. So far as the cultivation is concerned, it varies but little from that of corn, although at the first weeding, it may be a little more difficult unless planted upon very clean land. Messrs. Brown and Utley are the manufacturers here, and Mr. Brown has made close observations upon the subject and has become fully satisfied that the character and condition of the soil influence the result very much. This section contains a great diversity of soil, and therefore there has been an opportunity for learning some facts touching the case. In the first place, Mr. Brown is satisfied that it requires a warm, sandy soil and should not be planted too early; that if planted upon a moist wet, peaty soil, the yield of sirup will be much less and of poorer quality. He usually plants after he has planted his corn, and upon a soil that is dry, warm, sandy and fertile, and applies so liberal a quantity of manure—hog manure he considers the best—that it grows rapidly through the season. The sooner the juice is expressed after the cane is cut, the better, as there will be more and a better sirup. It should not be allowed to get frosted, as that would greatly injure the sirup. One of Mr. Brown's customers kept an accurate account, and the entire cost of his crop was 25 cents per gallon. He was offered 80 cents per gallon for the entire crop, but refused.

Tolland Co., Conn. WM. H. YEOMANS.

DROOPING SORGHUM.—For several years I have raised it and shall continue to do so. Stock of all kinds eat it greedily, but I deem it especially valuable in the poultry yard. The "good wife" who superintends this department, feeds the young chicks "ab initio" with this grain with the best results. Corn rye, oats etc., are grains that are too large for the little fellows to swallow unground. the flour must be wet into a paste to become available. All this muss and trouble can be avoided by feeding unground drooping sorghum. I commend it especially to those who use incubators. It does not require a long season for its maturity; hence it is adapted to a wide territory. Until forty bushels are sent away, Rural folks can obtain trial packages gratis, by sending a stout envelope addressed and stamped to R. H. CRANE.

Farm Topics.

THE USE OF PEAT FOR FUEL.

HENRY STEWART.

PEAT when free from sand, makes a very good fuel, giving out great heat, and when covered with ashes retaining a slow combustion for a long time. In burning, it emits a sweet-scented smoke which is very pleasant as it is borne by the breeze to the passing traveler. Its only fault is that the ashes are light and are easily wafted by a very light draft of air from the fire-place into a room. But what is there of all the useful things which nature has provided us with, that has not some drawback in the using of it? Efforts have been made to utilize peat for fuel in this country for the purposes of smelting iron and firing under locomotive boilers; but while we have coal and wood so cheap and readily available, the vast beds of peat which exist will probably remain dormant except for private household uses. The peat for the purposes above mentioned was compressed by powerful machinery into hard, solid masses not unlike the W. Va., splint coal, or the brown coal known as the lignite which is common in the far Northwest. But peat may be prepared for fuel with very little trouble.

In Ireland, Scotland, Wales and parts of England where there are extensive bogs or peat swamps, the peat is cut out in systematic but very simple fashion as follows:—The moss and sedges, with the upper layer of the peat, are removed by sharp-edged spades, when the brown, fibrous peat, which alone is used for fuel, is laid bare. This is cut out into blocks about nine inches long, six wide and six inches thick, with a tool called a skean. This is like a spade with upturned sides, and all the edges ground sharp. As the tool is thrust down into the peat, it cuts out a block of the size above mentioned. These are piled up in perpendicular ranks, like those of brieks in a brick-yard, to dry. In drying, they shrink to about two inches in thickness and somewhat less in length and width than when first cut. These blocks, or "turfs," as they are called when dry, form the only fuel of thousands of persons who live on the poor and small tracts of land (not to be called farms) that we are now reading so much about in connection with the distress in Ireland. They are also peddled about the streets of large towns and cities adjacent to tracts of peat bog, and are used there for summer fuel in wealthy homes and to make an agreeable and cheerful fire on chilly summer evenings, as they are kindled readily and give a fierce, glowing heat while burning.

There are thousands of acres of useful peat in thousands of localities in America, which might be made very valuable as fuel. In the prairie regions peat is plentiful, and as one goes further north into the treeless regions of the North Pacific Railroad, there are single peat swamps of hundreds of acres which have millions of tons of peat in them. The best peat lies deep in the swamp, below the upper layer, which has turned black and pasty by decomposition. It is the fibrous, brown matter that makes the best fuel, as it is tough and bears drying and handling and does not melt down, so to speak, into powder, as the black upper layer does. Once peat becomes dry it is practically indestructible, and if left in a heap soon decomposes and breaks down; so that in drying the blocks, it is necessary that they be piled with wide open joints between them and the pile made not over two feet wide, so as to give free passage to the air. The pile is also covered with the coarse weeds of the swamp to shed rain. Lastly, frost is the great disintegrator, and peat for fuel should be cut only in the summer time; if cut in the winter the frost would soon reduce it to powder.

HUNGARIAN HAY FOR HORSES.

SINCE I am asked by the Editors to answer the questions of R. H. C., of Orleans, Nebraska, on page 59, I would say in brief: Hungarian hay has in some way got the reputation of injuring horses when fed to them for a long time. How it got this bad name I do not know, but presume in the same way that clover hay did, viz., by being fed when improperly cured. But clover hay, when properly cut and cured, is an excellent feed, and is extensively fed by the Dutch farmers of Stark and the neighboring counties in Ohio, and to the great advantage of their horses, especially in point of fatness and sleekness. But it is harder to cure than timothy, more liable to must or mold in the mow, and is then most injurious to horses, and very liable to cause permanent heaves. The same is true of Hungarian grass. It is far harder to cure than timothy, and apt to grow musty, and is then, of course, injurious.

Again, it is more liable to have dirt and dust in it, as it does not form a turf-like meadow grass. Hand-raking is a remedy for this evil. Another trouble is *rust*. The pure, black-headed, (black-seeded) Hungarian is seldom attacked, but I have had the yellow-headed (yellow-seeded) millet rust badly. In that case I should not deem it safe hay for horses, no matter how well cured.

One thing more:—It should not be *ripe* when cut. Then the straw is of little value and the seed very heavy and very hearty, and might well injure horses. The heads are immense, and since the straw when ripe is nearly worthless, the horses will select the heads, and eat an over-ration just as they will of any grain. But if the hay is free from these faults, I should consider it a safe feed. One thing, however, I had almost forgotten to mention:—It has a curious power of increasing the secretion of urine; but I have not found this perceptibly injurious to the animals, though I have fed it largely to cows and considerably to horses, for several years. In a word, I should say:—"See that the hay is free from rust, dust, must, and over-ripeness, and I think you will find it safe." W. I. CHAMBERLAIN.

Farm Economy.

ICE-HOUSES ON THE FARM.

F. K. MORELAND.

IT is a matter of some surprise to thinking people how very few farmers, even those who are well-to-do, own ice-houses. A farmer may have all the modern farm machinery, elegant and costly buildings with all the modern improvements, but unless there exists some pressing reason why he should have an ice-house, he will get along without it. Farmers will live all summer without fresh meat, except on rare occasions; use butter just about as firm as oil; drink water or milk that is lukewarm, and suffer numberless other inconveniences which are the result of a lack of ice, for the simple reason that nine farmers out of ten cannot see any profit in going to the expense of erecting the necessary building. Even those living on or near streams that furnish good ice, are slow in falling into the habit of storing a quantity of it each year. In regard to this matter of a supply of ice: let one man in a neighborhood build an ice-house, store a quantity of ice in good shape and use it one season, and the next at least one-half of his neighbors will follow his example. Of those who do not, a small portion may be unable to do so, but the remainder can borrow ice from their more provident neighbors, or are too shiftless to make even ordinary citizens.

One reason why so few farmers have these conveniences is not only the cost of the building, but a lack of knowledge of how to keep ice. One of my neighbors built a house of stone, making a building that would have answered for a root cellar. His ice did not keep a month longer than if it had been in the open air. An ice-house need not be an elaborate structure. I have known good ones constructed of slabs or rails and straw. But it is much better to have one substantially made. There are on most farms some small out-building which has fallen into disuse, and which, with very little trouble, can be turned into a good ice-house When this is possible it should be done, as it saves useless expense. I have even known ice to be safely stored in one end of an unused mow. When it is as economical, the better way is to have a building expressly for it. This should be no larger than is required to contain the needed supply. It should be square in shape, and high enough so that when the ice is stored it will form a pile in the shape of a cube. When the dairy does not require a constant supply every day, three cords will be found a very good supply for an ordinary family The building should be well-drained, and when the ice is stored—and it should be packed as closely as possible—the whole should be well covered with sawdust. In storing it, between it and the wall of the building a space should be left, which should be filled with sawdust, closely packed. It should be ventilated, otherwise the ice will not keep.

There are from four to five months in the year when ice is a necessity, when it is almost impossible to be comfortable without it, and for that length of time last year my supply of ice cost me about four cents per day. Its value in the household for that length of time I dare not compute. We use it morning, noon and night in the preparation of iced drinks. Without it the butter used in the family would be unpalatable. By the use of a small ice-box, fresh meat can be kept until consumed. Too many cellars are so constructed that without ice it is almost impossible to raise all the cream on milk during very hot weather. With a Cooley creamer, however, and a liberal use of ice, no difficulty is experienced in getting all the cream in fine condition. I know that it was impossible, by any practicable test, to detect any signs of cream on my skim-milk. I think that the use of ice in my dairy alone last season paid not only for my creamer, but also for my ice-house and supply of ice.

But there is much more in the use of ice than can be estimated in dollars and cents. Those who live in cities cannot get along without their daily supply of it, which is as much of a necessity as their supply of meat or bread, and they are willing to pay what amounts to a heavy tax in the season for this luxury alone, and all this as a mere matter of family comfort. Is not the comfort of the farmer's family equally important? There are cases, as in sickness, when access to ice is one of the greatest blessings imaginable. And yet farmers continue to neglect procuring a supply. It is a cheap luxury. The labor of storing it is done at a time when no other work is pressing. The ice market is generally quiet. No speculators create "corners" in ice in the country. Any one who wants it can generally get it for—nothing. Now, farmers, one and all, store a supply of ice this winter and use it next summer, and see for yourselves if it is not a cheap luxury and a great blessing.

St. Lawrence Co.,

HANDY THINGS TO KNOW AND TO DO.

Making Ropes Pliable.

In a former letter I described some of the uses of ropes and how to handle them to advantage, and continue the topic.

Jute and manilla ropes are cheap and strong, but they are stiff and awkward things to knot or tie or to do anything with, in fact. If one takes a coil of such rope and, immersing it in a pot of water, lets it come to a boil, and after a few minutes takes it out and lets it dry thoroughly stretched, all the stiffness and "kink" will be taken out of it. If the rope be not too long, I throw it over the limbs of a tree, tie the ends together and lay a few rails or posts in the bight. If too long for this, it is made fast by each end in the crotches of suitably distant trees, drawn taut, and stretched by laying a few rails upon it. Thus treated, when dry it makes excellent halter or tie ropes, or, in fact, a handy and useful rope for any purpose and, for aught that I ever suspected to the contrary, it is just as strong as ever.

Stuck in the Mud.

Any one is liable to such an accident in getting timber or firewood out from the woods, or when going over poor roads with heavy loads anywhere. What is to be done? Every effort of the team has only settled one fore wheel, we will say, deeper and deeper. It is hardly possible that with fence rails for levers, after

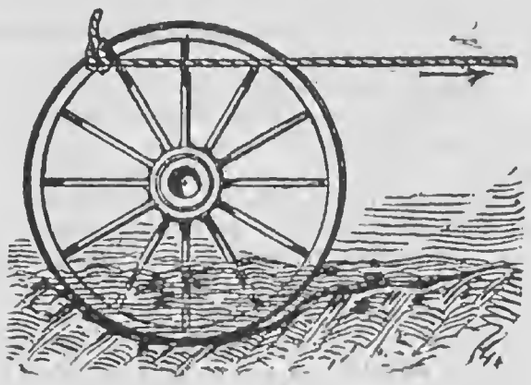

FIG. 33.

digging out in front and down by the side of the wheel, it may be lifted a little and the team will start it out, and then the hind wheel will drop solidly into the same hole, unless the hole is bridged very quickly and well. It is nearly as important to keep the hind wheel from getting in as to get the fore wheel out. The best way I know of is to make a sort of corduroy road, by laying sticks and rails across the rut close up to the fore wheel, and a little pile just there, so that when the start is accomplished the chasm may be easily bridged. Now, how to start:—Somebody must fetch a rope, if possible a block and tackle, or a pair of blocks, or, what is better, an extra horse or a pair of horses. Where shall we attach the rope? The most power will be gained if we make fast near the top of the wheel, a little back of the uppermost spoke, and then start up both teams very steadily. (See fig. 33.)

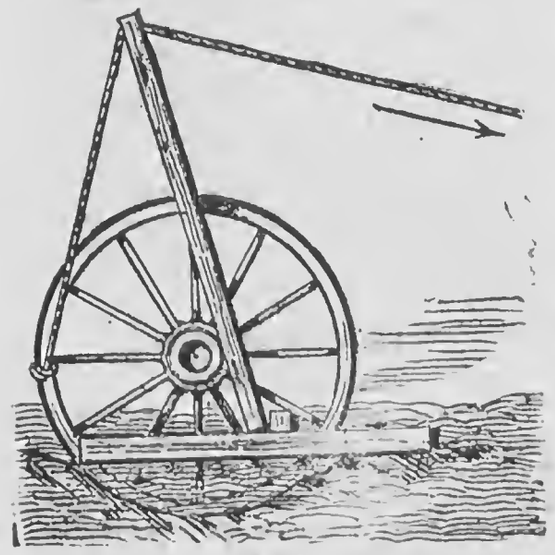

FIG. 34.

This may not work. The wheel may slip; or it may come partly out only to sink in again, and in either case the draft becomes a "dead pull," as soon as the wheel moves a quarter around. If two good posts can be found, one for a sill to rest on the ground, the other for a strut to hold the rope in the position of most effective draft; then the rope may be attached as far back as possible on the wheel, as in figure 34 passed over the strut, and the teams started again. This, it will be seen, lifts as well as draws, and if there is any hope of starting the load, it will be very apt to effect it. It is sometimes the quickest way to unload; but no one not experienced in the ways of bad roads ought to unload without trying every way to get out. It takes a good driver not to hurt his horses, or their harness, or their tempers or his own. It is a dear experience if horses become balky, and every effort should be made to have everything ready so that they shall not exert their strength uselessly, but that when they do pull, the load shall come out.

If, instead of making the rope fast at the periphery of the wheel, it be deemed important to lift as much as possible, we may attach the rope to the hub, or pass it around the hub. Then when the teams are started, one will lift while the other will draw.

A Handy Stump-Puller.

This same application of power is often useful in many ways. It is easy to see that when the bottom of the post and the point of attachment of the rope are very near together, the lifting power will be very great, but the motion will be very small. If the bottom of the post be set back a little, the lift will be much greater. A very handy stump-puller may be made on this plan: Take two white-oak straddles four inches through and, say, eight or ten feet long; bore inch-and-a-half holes through them near the tops, and put a crowbar through them, attaching a chain, as in figure 35 and a powerful draft may be applied. The chain must pass around the top of the posts, or be fastened so that it cannot slip. If the stump does not come out but is started a little, or even if it is not, the feet of the posts may be shifted so as to give more motion or more power, as may be needed. B. ☞ Y.

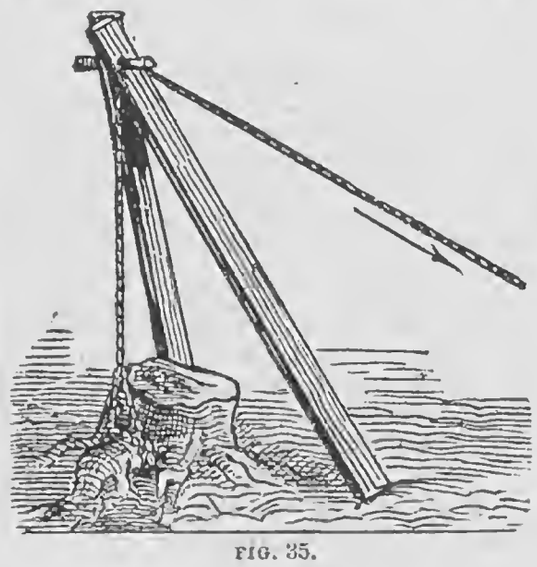

FIG. 35.

Sheep Husbandry.

SHEEP HUSBANDRY.

IRA J. BLACKWELL.

The question "Does it pay to raise sheep?" will here come under consideration. As few people wish to work without some compensation, the answer may be, that there is plenty of land in the older States that is worth but little except for pasture, and a great amount in the West, that has no other use at present; under these circumstances we must choose between sheep, cattle or horses. Cattle and horses require more capital than sheep, and more care and shelter; take longer to mature, and, moreover, horses require more judgment. It appears that the land that we farm should be in grass nearly half the time; for the last few years it has not paid much profit for grain raising owing to low prices. It is best to utilize this grass in some way. I think that an acre of good land will keep three sheep and raise a lamb for early market to each ewe. If we keep the lambs later or raise them entirely on grass, we must reduce the number. It will take to raise them, two bushels of corn each, worth here at present 55 cents per bushel, and 100 pounds of wheat bran, worth one dollar, making, with the feed given to the lambs, about $2.50 per head, or $7.50 per acre. Three lambs should bring $15, and three ewes ought to shear 10 pounds of wool, worth four dollars, which would make $19, leaving a balance of $11 50 to pay for grass, hay, fences, interest on stock and losses. The manure ought to pay for the labor. If the land is poor, this estimate is too high, for stock will not grow without feed of some kind. One sheep kept growing is better than three that just hold their own. There must be improvement all the time. "Almost fit for the butcher," I believe is the proper condition for stock, when raised for profit.

We might let the grass go down on the land and rot, if more profitable. We cannot take it off the farm to profit, unless we bring it back in some shape or other. The farmer that sells his hay and straw generally soon sells his farm; for without hay and straw we make but little manure, and without manure, corn, wheat and grass do not grow well in this section. It is to be presumed that attention will be turned more to sheep raising at the present time. Whenever anything that farmers raise gets to paying, all try that particular branch of industry, and the consequences are that prices rule low—and the beginner loses his enthusiasm and quits the business. That sheep raising has paid I think is certain; that it does pay is evident; that it will pay is probable. Yet all trades must be learned to be successfully prosecuted; and so with raising sheep. If we keep them to raise lambs, then we must endeavor to get the lambs ready for market in the shortest time and at the least expense. How shall we do this?

Probably the first consideration would be the best breeds for early maturity and to fatten. I think the South Down is best. Certainly a South Down buck and any well built ewe will bring a close well built lamb. This is especially necessary for early lambs. For later, a Leicester, Lincoln, Cotswold, or any good-sized ewe, will give more profit, perhaps; but they will take longer to get ready for market. Those ready to market in April and May bring the most money, and to sell best they must weigh about 70 pounds, and be what the butchers call ripe; that is, they must be fat and well fleshed up, which will take a South Down lamb four months. If we grow for wool and the flesh, the offsprings of the South Down crossed on the Oxfords, Leicester, or Bakewells, make a good weight of carcass, and would pay as well as any. Where the bucks are sent to market as lambs and the ewes kept for breeding purposes, when kept for wool, and to be sent to market when full-grown, I *think* the Lincoln would be best; but I have had no experience with this breed. The above breeds must have care and shelter. If large flocks are to be raised and with little care and expense, probably the Merino would be best, as sheep of this breed are hardy and increase rapidly.

For early lambs it is best to have a house that can be shut up in cold weather. There should be plenty of ventilation, but no chill drafts, as lambs dropped in January and February are too sensitive to the weather to withstand the cold of that season. With proper quarters and a cow to supply milk to the young lambs until they get strength to nurse, few lambs need to be lost. In very cold weather most twins will need some help from the bottle until they are old enough to eat meal, which they usually do at three weeks. We practice the plan of an extra pen for the lambs, so arranged that they go in and out at all times. We keep feed in this pen, feeding wheat bran at first. After the lambs are six weeks old we put in some Indian meal, always trying not to put in enough to cloy the little things. They will eat all the bran they want, and after a short time come back for more. With meal we find that, let them once get all they want, and it will be from a day to a week before their appetites return, and the lamb is put back about a month; for as soon as a lamb stops feeding well, it loses flesh rapidly. This is one reason why shipping early lambs long distances will not pay—they lose flesh too fast.

A large flock must have attention and at lambing time the flock-master will need some small pens in which to put the ewes that have twins, for where there are many in the flock, all twins ought to be kept separate from the flock until the lambs follow the ewe. There are very few ewes that will not own their lambs if put in a pen in which they can just turn round. There will be plenty of room for the lamb, and if the pen is of the right size, the ewe cannot butt the lamb. No violence is needed here—patience and perseverance are the requisites. The ewe will have to be held for the lamb to nurse. If she does not furnish milk enough, the cow must be resorted to. A bottle that holds a half pint is large enough; it should have a rubber nipple on top for the lamb to suck. I advise all who do not want to give extra time, care and feed to the flock, not to have the lambs dropped until April. At this date they will not cost so much to raise, taking less grain and attention. If dropped by the last of May or in June, good lambs can be raised without grain. In shipping to market, never send a poor lamb; keep it until it gets fat. If we do not get them fat in summer, we must keep them until winter, and feed them.

All bucks should be castrated if dropped after February, and twins after January, even when intended to be sent to market as lambs. Castration should be done with a sharp knife the same as with other stock. There's no need of the old way of cutting with a knife that only tears. We must deal kindly with our stock. The man that shouts and hammers around will not answer among the sheep or anywhere else; he was not made for the business, and if he is the owner, his balance will, most likely, be on the wrong side of the ledger. There is truth in the saying that stock grows while we look at them. Feeding alone will not answer all the requirements of animals. The owner's attention should be there, watching for any that are sick or lame or not improving with the rest, to see that all get a share of feed, and none too much and to see that some unruly ones are not injuring the weaker ones. A flock of sheep properly taken care of, are not likely to have the foot rot, which is mostly caused by neglect to keep the feet clean. When the weather is wet and warm in winter and spring, if the sheep have to be driven out of the pen, they will go through the mud, as they usually follow in the foot-steps of the one that goes first; consequently the mud presses between the toes or hoofs, hardens there; the sheep get lame and from bad soon get worse; in short, the foot will be found inflamed and between the toes will be a running sore, and if it gets under the hoof, we have genuine foot rot. Prevention is best, if possible. If through neglect the feet do get sore, apply a little muriatic acid at once; and if the sore is under the hoof it must be reached promptly; delay only increases the torture. Foot rot can be cured in in the early stages without much trouble; but when it has got a fair hold it can be got rid of only with much care, by washing with chloride of lime and applying the acid once a day; at the same time give each day an ounce of Epsom salts. For garget or caked bag we use camphor melted in lard and rubbed on while warm, not hot. Put in plenty of camphor and rub lightly.

Mercer Co., N. J.

The Swine-Herd.

FEEDING PIGS.

PROFESSOR E. W. STEWART.

The pork crop as represented in our exports, stands at the head of all our animal products. It is therefore important that all the economies of producing pork should be carefully studied. The pig has long been treated as if its constitution could stand almost anything. And perhaps the error leading to the most disastrous consequences has been the prevailing idea that the pig thrived upon the most concentrated food, and did not require bulk in its aliment to promote health. This error has not been confined to unthinking farmers; for the experiments of Dr. Lawes, of Rothamstead, and of Dr. Miles, at the Michigan Agricultural College, in pig feeding, were conducted wholly with concentrated food in determining the feeding value of corn meal etc. They evidently did not regard corn meal, fed alone, as too concentrated for the health of the pig. Yet they would not have regarded corn meal alone as a healthy ration for a horse. But the pig is as much a grass-eating animal as the horse. In the wild state both lived upon grass, but the grass-eating nature of the pig has been forgotten, and he is plied with concentrated food from weaning age till slaughtered, except in certain cases when it is desired to keep him cheaply for a few weeks upon grass. This summer pasturing of pigs ought to have taught the feeder a lesson as to its requirements for health.

Experiment with Grass and Meal.

Many years ago I tried an experiment to test the effect of grass in the ration of the pig.

A litter of six five-weeks-old pigs were divided into two lots of three each, of equal weight. Each lot was placed in a separate pen on the first day of June. One lot was fed wholly upon corn meal soaked 12 hours. The other lot had one quart of green clover, cut short with a straw-cutter and mixed with corn meal. Each lot of pigs had all it would eat. The theory held by the writer was that meal alone must go into the stomach of the pig in the plastic state of dough, so that the gastric juice could not penetrate this mass and properly perform its office, while the clover grass, being mixed with the meal, separated the particles and permitted the gastric juice to pass freely through and digest it rapidly. The clear meal being digested so slowly or lying too long in the stomach, would create fever and other disturbances in the system. The lot of pigs with the clover and meal were always lively, always ready for their feed; whilst the other lot with meal alone, would eat greedily for a time and then become dainty for a few days, taking little but water, showing a feverish condition of the system; but by fasting they appeared to recover the tone of the stomach, and would go on eating with an appetite again. This was repeated several times during the five months of the experiment. On weighing the two lots at the end, the one on meal alone averaged 150 pounds each; the lot on clover and meal, averaged 210 pounds each, or 40 per cent. more for being treated as grass-eating animals. Each lot consumed the same amount of meal.

The clover was intended as a palatable food, which should merely divide the meal or prevent packing in the stomach. Only about five quarts of the grass were given per day. The nutriment in the clover could not have made the difference in the result, although it was good food so far as that could be obtained from one pound of dry grass.

Experiment with Cob-meal.

This point of bulky food may be well illustrated by an experiment lately tried by a committee of two farmers' clubs in Connecticut to show the comparative value of corn meal, corn and cob-meal, and whole corn. The report is as follows:—

"Nine thrifty shoats were purchased, and divided as uniformly as possible into three pens. The experiment was begun April 1st, and ended June 6th. Lot No. 1 was fed 1,332 pounds of corn ground into meal—clear meal wet in pure water. Lot No. 2 was fed cob meal and water, 1,361 pounds of corn and cob meal. Lot No. 3 was fed 1,192 pounds of whole corn with water.

Results: Lot No. 1, weighed at commencement of experiment 453 lbs; weight at slaughtering, 760 pounds; gain in live weight, 307 pounds; dressed weight, 615½ pounds. Lot No, 2 weighed at commencement 467 pounds; when slaughtered, 761 pounds; gain in live weight, 294 pounds; dressed weight, 593 pounds Lot No. 3. live weight at start, 456 pounds; at slaughtering, 689 pounds; gain in live weight, 221 pounds; dressed weight, 567 pounds. Lot 1 gained in live weight for every bushel fed, 12.90 pounds; No. 2 gained 15.11 pounds; No. 3 gained 10.38 pounds. Lot 1 took 4.34 lbs. of meal for one lb. gain in live weight; and 5.68 lbs. for one lb. dressed weight. Lot 2 required 4.63 pounds to make one of live weight, and 5.93 pounds for one of dressed pork. Reducing this quantity of cob meal to clear meal, it will be found that 3.70 pounds make one of live weight; while 4.75 pounds make a pound of dressed pork. Lot No. 3 required 5.39 pounds of clear corn to make one pound live weight, and 6.55 pounds to make one of dressed pork."

These are valuable experiments, and the result greatly surprised the committee appointed to carry them out. They make this comment:

"These experiments show us that when we compare analyses of feed with results in feeding, there is something we fail to discover. Neither chemistry nor theory would expect that the corn ground with the cob would prove a feeding material of nearly equal value to that of clear meal; yet this experiment proves this to be the case, and further proves that cob-meal is superior in feeding value to that of clear corn without grinding. We have long been satisfied that a certain amount of coarse material fed to cattle with a concentrated food, was both judicious, economical, and profitable; but on account of the peculiar construction of the pig's stomach, we were not prepared for the result showing the desirability of feeding a coarse material in connection with corn meal."

This is just the point we have been considering. Physiology and the natural history of the pig should have taught feeders the necessity of feeding a proportion of bulky food. Here the ground cob, by its office of merely dividing the fine meal and allowing a free circulation of the gastric juice, has a value nearly equal to that of corn meal, performing the same office as that of the clover grass.

I have also proved by an experiment with short-cut clover hay in the winter—a few quarts mixed and softened with meal—that ten per cent. more pork could be made with the same grain feed when thus mixed with the coarse food. This is a matter of so much importance, I think, as to justify this extended notice. Bran is an excellent food to mix with corn meal; not that it is very well digested by the pig; but because it furnishes a coarse food to separate the fine particles of meal. I have had the best success with a liberal allowance of succulent clover that not only separates the meal in the stomach, but is, itself, well digested by the pig. In the winter, two quarts of short-cut hay, mixed with four quarts of corn, barley, rye or millet meal, and cooked or steeped and softened in hot water, will keep pigs healthy and cause a thrifty growth or fattening according to age and amount fed. When the pig shall be treated according to its nature in strict compliance with physiological principles, we shall hear much less of cholera and diseases of the stomach.

The Apiarian.

BEE HINTS FOR THE SEASON.

The winter has so far been remarkably favorable for bee-keepers. No penetrating frosts have endangered the colonies, whether in the house or left to winter with protection on the summer stands. On the contrary, it has been warm enough to admit of examining colonies standing outside at almost any time, and there have been many pleasant days on which the bees could with safety be permitted to fly, if this has been found necessary. Colonies that were put in winter-quarters in good condition, and properly protected against mice, have required little or no attention. But now as the spring draws near, the bee-keeper's vigilance should be unrelenting. On account of the pinched honey yield of last season, the bees were in many instances put in winter-quarters with a minimum supply of food.

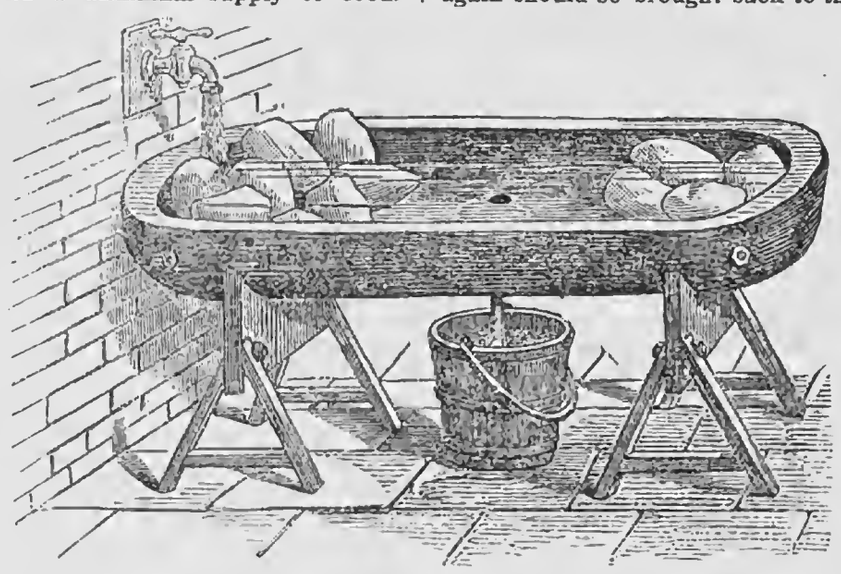

FIG. 36.

These should have immediate attention, and should the honey supply be exhausted, they must be fed without delay. We have so often advocated to feed nothing but the best quality of honey, or, in lieu of this, coffee A sugar, that it seems superfluous to repeat it. Frequent attempts to feed the bees poor molasses, or grape sugar, have abundantly demonstrated the falacy of such economy. The best quality of cane sugar is the only safe substitute for honey. The sugar is dissolved to a medium thick sirup in hot water, heating it just to the boiling point. There are now any number of feeders in use, each being considered the *ne plus ultra* by its particular friends. The best one, however, that we know of, one on which there is no patent, but which has been given to the bee-keeping public, is the "Division Board Feeder" invented by Professor Cook. Another feeder of merit, and a very simple one, can be made out of a cylindrical tin can with a tight-fitting cover. Punch a number of very fine holes in the cover, through which the feed can ooze out; when the can is filled and the cover replaced, turn it bottom-side-up on top of the frames. Since no air can gain admittance, the sirup will run out very slowly, and thus give the bees time to sip it up.

Again, the bees may be well supplied with food, but they may suffer from dysentery, which is a very prevalent disease. It is readily recognized by a pungent, disagreeable odor and an uneasy hum of the bees. If present, the combs will, on examination, be found to be besmeared with feces, and many of the inmates dead and dying. The only remedy is to allow the bees to take a purifying flight, and this chance should be given them on the first warm, pleasant day. Remove colonies in the cellar to their summer stands in the apiary about the middle of the forenoon, and let them remain there till towards evening, when they again should be brought back to the house or cellar. While they are flying, it is also best to examine each colony to learn its condition, and carefully clean off much-besmeared combs with a quill, and sweep off the bottom board. If these precautions are taken as soon as possible, and they have not been suffering too long, the disease may be arrested and the bees saved. To let the disease run its own course is certain destruction. Dysentery is generally brought on by a too high temperature, which causes them to be uneasy and to eat more than is for their good. On the other hand, colonies in a good condition, having food enough and suffering from no disease, mice or other enemies, should not be meddled with. The quieter they in that case remain until gentle spring shall again awaken nature and call them forth to work, the better.

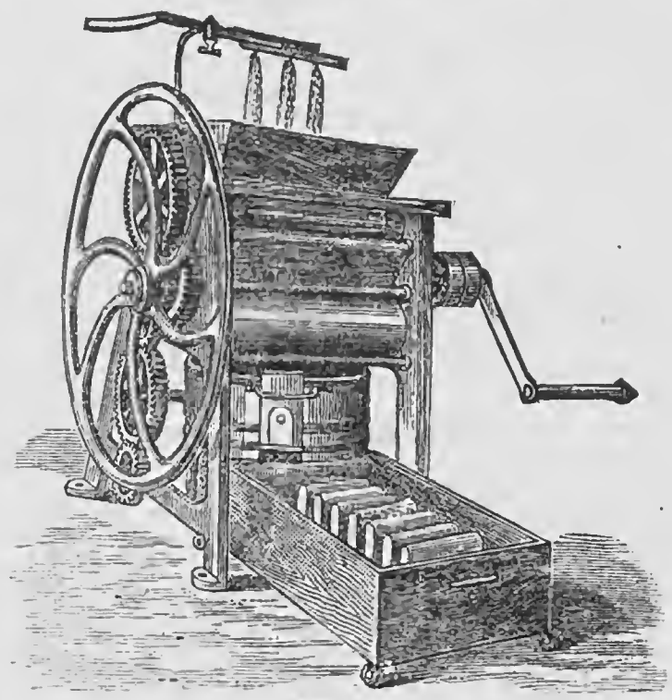

FIG. 37.

So much for the "personal" wants of the bees at this season. But this does not embrace all the work of the apiary. The winter is preeminently the season in which to make hives, frames and other needed implements. Now there is but little else to do; when spring comes there is always a pressure of duties, and delayed winter work which can no longer be postponed, must then be done at a double cost. Every bee-keeper should be mechanic enough to make his own hives, and whatever else is needed in the carpenter line. If there are any who make a business of bee-keeping, that still retain the old box hive, let them at once decide to abolish it for all future time. Too many farmers who keep but a few colonies, just to supply honey for home use, we know are still clinging to this hive. Let them take the same course. The venerable old box was good in its day; but its day is past. It marks a step in the progress of apiculture; now we are a step higher. Its last laurels are won. It cannot live in the presence of movable combs, artificial foundation, honey extractors, prize boxes and a foreign market for our honey. The present is the best possible time in which to decide on the particular form of hive that is to replace it, and when the choice has been made, purchase materials and make the new hives at home.

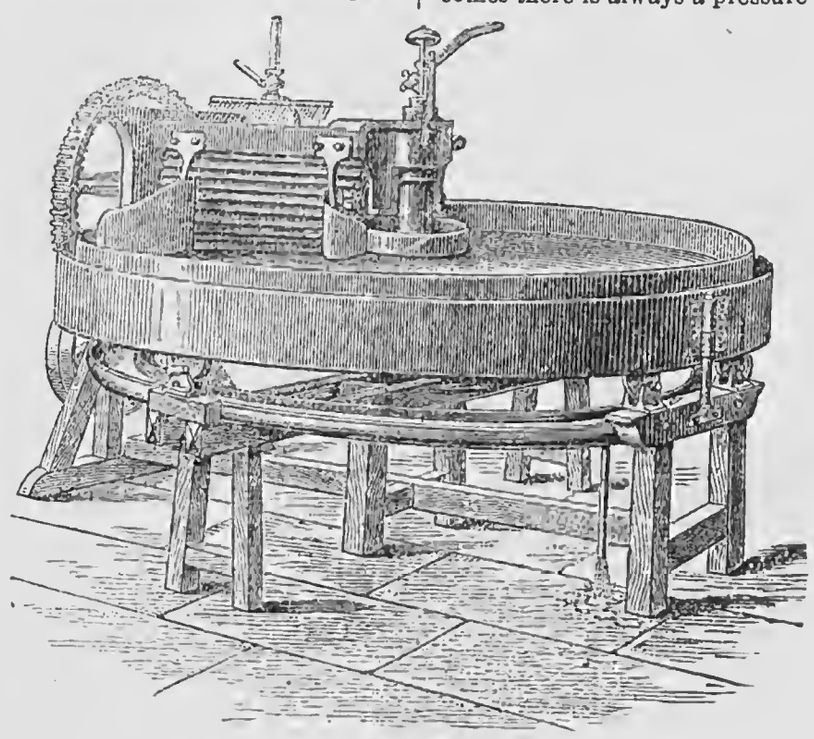

FIG. 38.

On former occasions we have given descriptions and illustrations of some of the best patterns. Avoid complexity in the pattern. Make every hive, frame, division board and cleat of the same size and shape as every other, so that transfers can be made at pleasure. Lay plans for the coming summer. Purchase seeds of honey plants if such are raised. Study the bee literature. Learn what others have done and how they did it, and thus follow their successes and avoid their failures. In short, leave nothing till to-morrow that can be done to-day, and in a few weeks when spring opens, all will be ready, and the work can be done satisfactorily.

Dairy Husbandry.

LADLE OR "MILL" BUTTER.

In the art of butter-making there is no point, so far as its commercial value is concerned, of greater importance than uniformity, not only of quality and texture, but especially of color and shape of package. This was always felt to be a great drawback in handling the butter from numerous small dairies. To overcome this objection, many devices and processes have been invented. The most important of them is the factory or creamery system. Instead of a dozen farmers making a dozen different grades, colors and shapes of butter, all carry their milk to one place and have one man make it into a uniform article, and that with a special view to suit the requirements of a special market.

The first step, however, that was taken toward accomplishing this end, was in the use of the several machines and contrivances pictured here, which have been redrawn from the Ag'l. Gazette. In France as in this country, hucksters went about the country and picked up numerous small lots of butter, and bringing them to the shop or store where the manipulation took place, the various lots were sampled and separated by an expert in judging the quality of the various sorts. Those of a certain grade would resemble one another only in taste. Those lots of uniform taste would be put in the large trough (Fig. 36), water turned on, and men with strong hands would knead it thoroughly together, making it one homogeneous mass, and, if the demands of the market required it, more salt and a given quantity of coloring matter would be added. In this country it has been the general practice to keep the hands off the butter, ladles being used instead. This butter, when packed in tubs, presents a uniform appearance, and in the trade goes under the name of "ladle butter," the expert dealer being readily able to detect the effects of mixing, in the broken-down grain and general salviness of the article.

After this primitive process came various machines invented to save the manual labor of breaking down the butter, which was considerable in cold weather. Some of these are represented at Figures 37 and 38. Here the butter is assorted as in the above process, and the lumps of a given quality are ground together by means sometimes of iron rollers or a mixing machine, like that used in a brick-yard for working the clay. These machines always mix the butter more thoroughly than the old method, but consequently destroy the grain more effectually and render the butter more salvy and with poorer keeping qualities. This has given rise to still another brand of commercial butter known as "mill-butter," that uniformly sells for several cents a pound less than even "ladle-butter." It is said the farmer never knows in what country his butter will be marketed. In this instance he would not recognize his own handiwork the next day after he had parted with it. L. S. H.

VERMONT DAIRYMEN.

(Rural Special Report).

The annual gathering of the dairymen of Vermont met at Brandon on the 21st, 22nd and 23d inst. It has been my pleasure to attend many such gatherings throughout the States, but I have never been more edified and instructed than at this one. Vermont is one of the real live dairy States with a constant eye to improvement, and an honest ambition to be abreast with the times, not only in making, but in marketing her products.

On this occasion the most prominent of her citizens lent their presence to give interest and tone to the meetings. It is not in many States that the Governor will put himself out so much as to attend a gathering of farmers, especially if no election is in the immediate future. Speakers of prominence from other sections were engaged to handle the special subjects in the dairy.

Local talent was called upon the first day in the opening exercises, and many good things were laid before the attentive audience. After electing the old officers—Hon. E. D. Mason, President, H. W. Vail, Treasurer, and O. S. Bliss, Secretary,—the regular order of business was resumed. The president gave a cursory sketch of the Vermont display at the International Dairy Fair, complimenting his State on the appearance and management of the fair generally, and expressing his particular delight at the information he gained there that should his cows ever again become unprofitable, he could drive them down to the foot of 42nd Street and have them turned into butter—hide, hoofs, horns and all.

An address from Dr. Mott was read, in which he called the Channel Islands "Alderney Islands," and stated that there were four of them, each possessing a separate breed. This will be news to Jersey breeders, especially as to Sark and Alderney. He also quotes Dr. Sturtevant describing the model Ayrshire with short legs and short teats, and a mirror within her escutcheon. For once the doctors do agree!

Ex-Governor Smith paid an eloquent tribute to the dairy history of Vermont, but warned the farmers to be on the alert against their wide-awake rivals of the West. He advised greater thoroughness and the keeping of records on the farm, in order to raise the average of Vermont cows, which average a yearly yield of only 98 pounds of butter. While he lamented the distress of England and Ireland, he still congratulated this country upon its ability and opportunity to feed them. He made the remarkable statement that farm products, like beef and wheat, could be laid down in England by farmers living a thousand miles west of Chicago, at a profit, and at lower prices than those at which English or Irish farmers could produce them, even if they had their land rent-free, or owned it as Western farmers do theirs.

He was called upon to explain why it was, he being the president of the Vermont Central Railroad, that butter and cheese were carried from Chicago to Boston for less rates than that passing over that road from St. Albans to Boston. This looked like a fearful discrimination against local freights. The Governor, however, apparently gave universal satisfaction by proving that the butter from Chicago was not made in Chicago, but had paid as high rates to get to that city as Vermont butter pays to get to Boston; thus whatever charges were made from Chicago were that much more on the butter and in favor of the Vermont dairyman; that is, most of the Western butter is made in Western Illinois, Wisconsin and Iowa, and averages 100 miles from Chicago, and to get it there costs $1.40, $1.50 and $1.60 respectively.

L. S. Hardin spoke a piece on the subject of testing cows. He said that a number of prominent breeders of each class of dairy animals had organized the National Dairy Cattle Club for the purpose of recording the yields of dairy cows. This was done that the poor ones might be weeded out and the best be bred from, just as the process is now carried on of recording the performances and improving the breeds of trotting and running horses. He claimed that no dairyman had a correct estimate of the value of the cows in his herd, and instanced his own surprise at the mistaken estimates he had put upon his own cows before he recorded their yields.

Mr. Willard then took a range pretty much all over the dairy interests of the country. He pictured in striking colors the peaceful and harmonious pursuits of the farm when compared with the stormy and exacting life of a city merchant. Even oleomargarine, he thought, might do the farmers some good by cutting off the tail of the market and forcing all butter makers to make a prime article. He then reviewed the improvements of the dairy. Higgins's process of shipping butter, when in granules, in barrels of brine, had been tested by sending a lot of it to England, and when put upon the market it brought the same price as the best home-made English goods. He touched upon many other new ideas and had even a good word for Durand's cow milker. He was in favor of farmers keeping records, and concluded with the special charge that all the good things we have were not furnished by nature, but by art. He aptly put it thus: "No Short-horn cattle or thoroughbred horses roamed our primeval forests; no golden wheat or luscious fruits or wholesome vegetables grow upon the uncultivated lands." It seems to be, at least in some instances, a case of the sweat of the hired man's face.

J. D. W. French gave a most admirable essay upon the virtues of the Ayrshire race of cattle. He acknowledged that after listening to such an argument, Jersey men would go home Jersey men and Short-horn men would go home Short-horn men. But he came to speak to that large class that had not adopted any of the breeds. He thought the Ayrshire cattle were adapted especially to the wants of New England, with her rugged pastures and often thin soils. He touched on the history of the breed and dwelt with energy and force upon the proposition that the Ayrshire cow would make a greater amount of milk from a given quantity of food than any other breed. He has kept the record of his cows for six years, and is a firm believer in the necessity for such a method in improving the dairy value of cows. He told of the preacher who was called upon for a short address to a gathering of dairymen. He described the killing of the fatted calf. He was sure it was a blooded animal and had been cherished and preserved in the family *for many years*.

Mr. Adams, Secretary of the New Hampshire Board of Agriculture, gave many happy suggestions as to the needed improvements in farm management, such as harrowing growing crops, using new kinds of machinery, some of the riding harrows, droppers, etc., needing but one improvement, and that was a place for the horse to ride.

Governor Proctor pictured in striking colors the rising splendors of the State. All he knew of dairying was his first experience when as a handler of milk, he became large enough to wind up his daily petition with, "Give us this day our daily bread *and cheese*."

Prof. Englehart told all about how to keep the stable as sweet as a young lady's boudoir. He prefers sulphur, burnt with alcohol on a frying-pan, as the best disinfectant. Salt, he says, will absorb bad odors, and therefore should not be kept near coal oil, salt or dried fish, etc., if it is to be used in butter or cheese. He then described his methods for testing milk, as he was the milk inspector of Syracuse. The farmers did not seem to be favorably impressed with his reliance on the lactometers. He admitted a variation of 14 degrees in milk, but they were willing to agree that if the milk in the can in town showed a variation of 18 degrees from the milk when drawn from the cows at the stable, there was a strong probability that some one had been baptizing it. H.

Miscellaneous.

THE OTHER SIDE.

THE RURAL NEW-YORKER has received a goodly number of kind words and compliments during the past two years, a few of which, during subscription times or as campaign documents, it has thought well to place before its readers. It will seem, however, that all who examine the RURAL are not of the same opinion, as will appear from the following letter. It may be well to remind the writer that the RURAL NEW-YORKER being *national* in its field of work, cannot give *special* consideration to any *one* of the agricultural organizations of our country:—

"I have received the specimen of your paper. I have examined it carefully and find it a first-class, old-fashioned farm journal, conducted on the basis that all farmers are fools, and always will remain fools, so that they require a sort of dry-nurse in the shape of a weekly magazine to warn them of the stumbling blocks in their way, and to keep them from being imposed upon. I cannot believe that you are ignorant of the fact that some years ago there was an association started in this country to enlighten, educate, and improve the farmer. It now numbers over half a million of members; owns hundreds of halls that are used exclusively for their weekly or fortnightly meetings; has established hundreds of schools that are owned and controlled exclusively by farmers for the education of their own children; in short, it has done more in ten years to elevate the farmer, teach him to attend to his own business in a business-like way, and to grapple with the discomforts of his isolated life, than all the agricultural journals that have been published in the last forty years. I have looked in vain through your columns for any notice of this movement; and for you to pretend to publish a farmers' paper and ignore a fact of such vital importance to them, is a positive insult to their understanding. When you devote a portion of your paper to defending and teaching the principles of the Patrons of Husbandry, and to giving the farmers some account of what they are doing for their own advancement, you can consider yours a farmers' paper. Until you do so, you must be content to take a back seat among the "old fogies," who furnish the farmer with a paper at the lowest price and then throw in a jack-knife, or, if he will get a lot of fools in the same trap, will give him his choice from a pencil to a $300 piano. I took the sample copies you sent to our grange meeting last Saturday and told the brothers that if any of them, who were subscribing to our grange publications wanted a good agricultural paper, they could not do better than to take yours; but that their first duty was to support their own organs. There were between thirty and forty present. ROBERT H. GILMAN.

Lecturer of Milford Grange, Del., No. 6. Jan., 16.

WHAT OTHERS SAY.

FOOD ADULTERATIONS.—Our respected contemporary, the Boston Journal of Chemistry, speaking of "Food Adulterations," quotes from what several Chicago chemists have said, adding some very sensible suggestions and advice. What these chemists say is enough to frighten any nervous person out of his wits. One must believe that to eat is to be poisoned—slowly poisoned. The following are a few paragraphs of what the Boston Journal quotes more at length:

"I never use the pickles generally sold in our markets. I think the yellow pickles are quite as dangerous as the green. I know that lead is largely used in their manufacture. Verdigris is used in making the green.

I have examined a large number of specimens of oleomargarine, and have found in them organic substances in the form of muscular and connective tissue; various fungi, and living organisms which have resisted the action of boiling acetic acid; also, eggs resembling those of the tapeworm. I have them preserved, to be shown to any one who desires to see them. The French patent under which oleomargarine is made requires the use of the stomachs of pigs or sheep. This is probably the way the eggs get in. I have specimens of lean meat taken from oleomargarine. There can be no question that immense amounts of oleomargarine are sold and used as pure butter. I regard it as a dangerous article, and would on no account permit its use in my family. I do not dare to use the sirups commonly sold in our markets, and I use but little sugar, as I believe them nearly all adulterated. In regard to glucose, I am informed and believe that seven-eighths of all the sugar sold in Chicago is made of, or adulterated with, glucose. I have made more than a thousand microscopical examinations of milk in this city. I think that not over ten per cent. of the milk sold here by dealers is wholesome and unadulterated."

The Journal of Chemistry concludes its comments upon the above statements as follows:

"Dangerous frauds are no doubt practised to an extent demanding serious and prompt attention; but any assertion which leads the public to believe that every article of household use is dangerously sophisticated is calculated to do harm, and its falsity should be exposed."

DO FARMERS WISELY CHOOSE OCCUPATIONS FOR THEIR SONS?—At a late meeting of the Syracuse Farmers' Club Mr. Edwards said: "A farmer has two sons; one has strong physical development and a natural taste for farming; to use the hoe and follow the plow day after day is both congenial to his feelings and his health; his mind rests in quiet satisfaction as he looks out upon his father's broad acres, and views with manly pride the growing flocks and fattening herd, and estimates in dollars and cents their value. The other son lacks the physical strength of his brother, but has fine, sensitive nerves, and a deep thirst for scientific or legal knowledge. He goes to the fields with his brother, with heavy tread because it is his duty to go, but his thoughts are among the planets, trying to calculate their distances from earth, and the influence they have upon the seasons. Such a boy can never make a successful farmer, no more than the other can make a successful astronomer. Parents should at least be as wise in looking after the fitness of their boys for their chosen business, as they would in training their colts. But how is it? A farmer goes out to examine his young horses: there is four-year-old "Dick," large, strong, close-jointed, and mild-tempered, slow and steady, a good horse for the team. There is young Flora, smaller, long-jointed, with deer-like limbs, and high temper, can be made to trot in 2.20, worth $5,000. No farmer will ever make the mistake, and put Dick in training for the race-course and send Flora to haul stone. Now, his boys are just as unlike as his colts and need as different training. The judge naturally wants his sons to become lawyers, so, too, the minister, merchant, mechanic and farmer too often insist that their boys follow the inclination of the parent rather than their own. It is a fact that most of the failures result from not putting the right man in the right place. Had Franklin always been kept at the tallow chandler's trade, the lightning might never have been subservient to the will of man in transmitting our thoughts from continent to continent in a moment of time. Had Edison been put upon a farm, and kept there, his whisperings would not now be heard from city to city."

COLORING BUTTER.—Mr. Hawley, of the Onondaga Co. (N. Y.) Farmers' Club, finds that Indian meal fed to a Jersey cow will give both the color and aroma of grass butter. Buckwheat bran and oil meal both would make the color white.

Mr. Terry said it was absolutely necessary to put butter in the market that customers would take; they wanted colored butter, and it must be colored, or the dairyman would take the consequences. If the market says color, you must color with artificial means or by feeding.

Mr. Overacre urged the farmers to adopt the method of natural coloring. First select good cows, butter cows, then feed them well, and you will get good-colored butter.

Mr. Geddes said the question was simply the old one. When he was a boy they pricked horses' tails to make them carry them high and look spirited, and a horse could not be sold unless his tail was pricked. The demand in the market was for colored butter, and it must be colored by feed to the cow, or artificially when making. He had eaten butter in Philadelphia, that had cost $1.15 per pound, and on the table that stuff showed the carrot fiber with which it had been colored. People who wanted to eat their carrots in that way and pay $1.15 per pound, should be given the privilege they demanded. The next day, at the same table, he had eaten butter that cost 50 cents per pound at the corner grocery, and, for his taste, it was infinitely superior.

DRY COWS.—It is a common practice among some dairymen to give their cows, when dry, but scanty living. When a cow ceases to give milk, or is dried up, any feed is considered good enough for her. I think this is a great mistake, and the result is a diminished product of milk, both in quantity and quality, when she does come in. There is a large draught on the system to sustain the calf while the cow is carrying it; and to keep the cow in good condition good feed is as important as when she is giving milk. It is my opinion that one dollar's worth of food when the cow is dry is worth one and a half dollar after she comes in. An animal in poor condition cannot digest as much food as an animal in good condition. If the cow is poor when she comes in she will not digest enough food to support the system, and, at the same time, to make a large quantity of milk.—Monthly Bulletin of the American Jersey Cattle Club.

COWS IN MILK.—In many countries, says the Agricultural Gazette, part or all of the field work is done by cows, and if these cannot be well cared for, or if they are overworked, the flow of milk is immediately more or less diminished. On the other side, the advantages of a moderate exercise for the cows ought not to be underrated. Cows want exercise and fresh air as well as other animals, and how often do they get little or nothing of either? How can we expect a cow to be healthy if she is kept altogether in the stables where she inhales constantly bad air? and how can she bear healthy and fully developed calves under such circumstances? Moderate work for cows cannot be condemned in principle, provided they are not overtired, and the slight decrease of milk, which is unavoidable, is more than covered by the work accomplished. Cows in milk ought not to work longer than three hours a day.

THE CENTAL SYSTEM.—In my (cor. Mark Lane Express) opinion the people who would be most materially benefited by the uniform use of the cental would be the farmers themselves. The advantage of being able to compare the prices paid in different markets, home and foreign, would be very considerable. Depend upon it the more open and simple a trade is, the better it is for both producers and consumers. It is the middlemen who get the advantage of a dark or intricate system. They know more of the ins and outs of the trade than farmers can know, and they are often able to use their knowledge to their advantage.

TO KEEP WELLS PURE.—A correspondent of that sterling paper, the Inter-Ocean, writing from Battle Creek, Mich., says that he purified his well of water, which was subject to many worms, bugs and other insects as to render it almost unfit for drinking, by placing in the well a couple of good-sized trout. They have kept perfectly healthy and have eaten up every live thing in the water. In the winter season crumbs of bread or crackers are thrown in. The water is perfectly pure and sweet.

CATALOGUES, ETC., RECEIVED.

NOTE.—Readers are referred to our advertising columns for any particulars omitted in the following necessarily brief notices:

JAMES M. THORBURN & CO., 15 John St., N. Y. Catalogue of 95 pages descriptive of all sorts of seeds for the vegetable and flower garden, lawn, farm and nursery, embracing in its entirety probably one of the largest collections to be found anywhere. We take great pleasure in commending this catalogue to our readers and friends. Established in 1802, this firm is everywhere known and respected for its fair dealings. The catalogue will be sent to all who apply, without charge.

PROGRAMMES of Cook's Grand Excursions to Europe for 1880 by the Inman and Anchor lines of steamers. It is proposed to visit the chief points of interest in all European countries. Thomas Cook & Son, 261 Broadway New York.

Everywhere.

NOTES FROM FLORIDA.

St. Augustine, St. John's Co.—My land is mostly devoted to the Orange, Lemon, Lime Fig, Shaddock, Citron and Banana. I have the Magnolia grandiflora 40 feet in hight, the Eucalyptus, Date Palm, Sago Palm, Royal Palm and Cabbage Palmetto; also the Japan Plum, Pomegranate, five varietes of Honeysuckle, three Passion Flowers, two Wistarias, four Bignonia radicans, the Yellow and White Jessamine, English Ivy, five varieties of Lantana five varieties of Camellia Japonica, Aristolochia Sipho—this latter is a native here also—the White and Red Honeysuckle, and the Coral Plant. We have the Akebia quinata the great variegated Pittosporum, White and Red Oleander, the Yucca gloriosa, and Yucca filamentosa. Besides these we have about 100 varieties of the ever-blooming Roses. We have about 40 varieties in full bloom at this time. Of orange trees we have 75, but only eight are bearing now. The best products here are cotton, sugar cane, tobacco, sweet potatoes, peas—the cow pea flourishes here—beets, turnips, cabbage. Much is done in orange culture and that is rapidly increasing. Early vegetables are grown here for the New York market; Strawberries do well; so do tomatoes, squashes and melons. Corn, oats, rye, wheat and barley do not pay for cultivation here to any great extent. Many other semi-tropical plants could be profitably cultivated, such as the Tea Plant, Almonds, the Olive, Grapes, Peaches, Pecan Nuts, etc. But to be successful requires Northern Industry and Northern intelligence. This warm climate leads the native to be indolent and thriftless. The climate, however, is delightful. We have not yet had a frost this season, the mercury to-day is at 82°—the lowest this season was 42°. I came here for my bronchial trouble, and began coming south in 1834, and feel myself quite well informed of this climate. This is no doubt as healthful a climate as the world possesses. We have the advantage of a bright sun and the delight of a sea breeze.

H. A.

RURAL SPECIAL REPORTS.

California, El Dorado, Jan., 19th.—We have had the coldest winter ever known here; ice about 1½ inch thick, something unknown to our oldest inhabitants. For the first time there are no flowers in bloom in my garden. The ground is soaked completely with the heavy rains. But we do not grumble. On the contrary, every one looks forward to the best summer for gardening and agriculture ever known in our State. A few good late rains will, with what we have already had, make millions for the farmers. W. C. L. D.

Conn., Columbia, Tolland Co., Jan. 19.—We are having a very open winter. The prices paid for farmers' produce hardly keep up with the advance on necessary family stores, and some are still looking for the "better times." W. H. Y.

Illinois, Balleyville, Ogle Co., Jan. 24.—The weather has been very mild here this month, with considerable rain and but little snow. There was enough snow on New Year's and the day following to make tolerably good sleighing; but heavy rains set in on the 3rd. inst. and the snow soon disappeared, the frost came out of the ground, and there was mud everywhere almost, but especially on low undrained ground. On Monday night, 19th. inst. following a rain, some three or four inches of snow fell, but it did not last long; then on Thursday morning, 22nd, we had some two or three inches more of snow, but it is thawing quite fast. Winter wheat has not suffered much, we think, while bare, as there have been no sudden and severe alternate freezing and thawing; but it is not yet out of danger. Business has not improved any since the beginning of the new year, but seems to be getting worse for the farmers. The strike of the laborers at the stock-yards in Chicago, which lasted a month, had a damaging effect upon the producers, as well as upon the packers, and it fell with crushing force at last upon the "strikers" themselves, so no one was benefited, while all suffered more or less. The late break in the price of wheat is very discouraging to the farmers who have any to sell. It seems to be caused by speculators who have accumulated large quantities and refuse to ship it abroad where it would "do the most good;" and the present high rates of freight on grain by rail from Chicago to New York and other points—40 cents per cental, equal to 24 cents per bushel—are another cause of the grain blockade and the bursting elevators in Chicago. What the outcome of this will be no one can tell; but we hope for another "boom" in business, when Lake navigation opens. Wheat is now about 15 cents per bushel lower than it was a month ago. Other kinds of grain are somewhat depressed, but have not fallen so much as wheat. Our country markets, which are governed principally by Chicago, are in an unsteady condition, and dealers are at a loss to know what to do. As the roads are bad and the prices of produce weak and unsettled, there is very little doing. W. B. D.

Kansas, Morris Co., Jan., 20.—It is quite warm and wet here now, but a cold wave struck here about Christmas time, the mercury falling to 10 degrees below zero. A large amount of winter wheat was sown here last fall, which is looking splendid. Much of it was pastured last fall to avoid too large a growth. A very fair crop of all kinds of farm products was grown here the past season. This county is receiving a very large immigration, although not so large as counties through which pass one of the great thoroughfares of the State, but yet there is room for many more good farmers and mechanics and for all kinds of reputable business. Fruit growing here is as yet in its infancy, although a few farmers have apple and peach trees in bearing. Nursery stock is quite reasonable in price, good two or three-year-old apple trees (home-grown) can be bought from $8 to $12 per hundred. J. E. R.

Kansas, Coffeyville, Montgomery Co., Jan. 23.—We have lived here six years. It is a beautiful country, especially in spring and summer, when the whole prairie is carpeted with green, and dotted all over with bright-hued flowers. Many of them are advertised in the catalogues, such as Digitalis, Verbenas, Catchfly, Dutchman's Pipe, Virginia Creeper, Sensitive Brier and many others I know not the names of. There is one objection, however, to Kansas—the wind blows so hard here that, as an old lady once remarked, "It seems like it'll blow all the *side* off of Kansas;" but we have got used to it and do not mind it much, and two-thirds of the time it is very calm. People are flocking here "like flies around a drop of honey." They seem to think Kansas is "a slice from the juciest side of the earth," and I guess it is.

Mass., Raynham, Bristol Co.—Perhaps by this the Rural readers have heard all they wish in regard to Pearl Millet; but I have just arrived at what I judge to be a fair conclusion as to its merits and it may be interesting to the host of new readers at least to learn the results. The seed you sent me was sown about the last of May, at the same time, in like soil and under the same conditions as Western corn for feeding milch cows. The Millet was sown in rows about four feet apart, and one plant allowed to grow every two feet. The corn was planted in rows 3½ feet apart, and at the rate of three bushels of seed to the acre. As the Millet grew much more slowly the first of the season, it was more labor to keep it free of weeds, but after settled warm weather, it gained upon the corn until at harvesting, there was not much difference in the amount of forage; but while the violent winds prostrated and ruined a large part of the corn, the Millet was entirely uninjured. When about half grown, and again at harvesting, I fed a portion of it, which was as good as the corn. But the Millet, at whatever time it might be cut, would not start to grow again any more readily than corn cut at the same stage. So far it must be a success in that its perfect resistance to our heavy winds must be an advantage quite commensurate with the labor of the extra cultivation during the early part of the season. But as a winter feed it is not equal to corn. Although, owing to its standing erect, it was cured much better, yet my cows refused to eat it if other good food was offered. C. D. L.

Minn., Winnebago City Township, Faribault Co., Jan. 22.—This county is one of the southern tier, about 160 miles west of the Mississippi. It can with truth be classed as the garden county of the State. Farmers are jubilant over the prices they are getting for produce and stock. Wheat sells for $1.10 per bushel; timothy seed—of which there was a large acreage raised here—brings $2.25 per bushel; live hogs 4@$4.50 per 100 pounds. Splendid improved farms with a soil unprecedented for richness, producing wheat, corn, oats, flax, and sorghum of the richest flavor, can be bought for from $2,000 to $3,000, containing 160 acres. Unimproved farms are selling for about $10 per acre. Our market facilities can't be surpassed; the So. Minnesota R. R. Co. running two roads East and West through the center of the county, and the Sioux City and Blue Earth Branch running north and south from Mankato, and terminating at Fort Dodge, in Iowa, supplying the inhabitants with coal. So with the timber belts on the Blue Earth and Maple rivers, both running through the county and supplying all the wood needed for fuel besides water power for a number of grist mills. The climate is unsurpassed for its healthfulness. The 25th of December was the coldest day this winter, the thermometer marking 33° below zero. It has been very mild all this month thus far. H. F. S.

Michigan, Laingsburg, Shiawassee Co., Jan. 20.—We have had a pleasant open winter. About ten days' sleighing in December, but there has been no snow visible for weeks. Grass has grown; sheep have picked their living, and wheat is as green as in May, promising finely. Fodder was rather scant, on account of the severe drought, but the mild weather has helped, and most farmers in this vicinity will get through very well. Much more than the usual quantity of rain has fallen. To-day we are having quite a snowfall. G. M. K.

Michigan, Utica, Macomb Co., Jan. 26.—We are now having very fine weather for winter. It is almost like summer. We have had but very little cold so far. Wheat is looking fine. The prospect looks very favorable for a large crop the coming season. Our crops for the past season were very good, with the exception of corn, which was generally rather light, as it was very dry at the time it was setting. This is one of the best grain counties in the State. Utica is in one of the finest-located places in the State. It is on what is called the Shelby Plains, about six miles from Detroit. J. P. P.

Mo., Kingston Furnace, Washington Co., Jan. 23.—The winter is the mildest I have known for years, and very cloudy and wet. The area sown in winter wheat is very large, and the crop looks well. Those who sowed early were troubled by the fly, and in some cases had to resow. The wet and warm weather is unfavorable to lead mining which is the principal industry here during the winter. The business "boom" has kept the Western cities and railroads exceedingly busy. The feeling in favor of securing a portion of the immense immigration, which all feel sure is to take place from England during the coming year, is very strong. It exhibits itself in the formation of Immigration Societies and in advertising farms and lands at low prices. This is a number-one region for stock growing, well shaded, well watered and with good farming lands in the valleys and in many parts of the uplands. It still has a stock range along the pine-clad spurs of the Ozarks, reaching from less than 50 miles of St. Louis to the cane brakes of Arkansas. Herders could drive south as winter approaches; spend that season in the cane brakes, and return on the spring grass with their cattle ready to drive them from the range directly to market at St. Louis in two days' time. Herders here would prove welcome to buyers of stock and feed. Settlers could purchase lumber for shelter cheap and hire stock fields for part of winter feeding, and would have no quarrels on the plains with either sheep men or settlers. It is not a large field for the business and that perhaps is the reason why it is not occupied at all, or even known, but its nearness to market and base of supplies, its good range and freedom from storms, and the fact that it is open to the first comer without let or hindrance and with no necessity to invest a dollar in land for years, so that all the herder's capital can be put in stock—all this, I think, puts this range in the front rank for advantages for a moderate amount of either sheep or cattle or both. N. W. B.

N. Y., Elmira, Chemung Co., Jan. 24.—There is a marked contrast between the present prices of farm products and those of a year ago. The prices of the principal products are as follows:—Wheat, $1.40@$1.45 per bush.; corn, 63@65c. for 60 pounds; oats, 38@42c.; potatoes, 35@40c. per bushel. Good hay sells for $14 and loose oat straw at $8.00 per ton. Tobacco farmers are busily engaged assorting their crops. There is little activity in the tobacco market here at present. Probably one-half of the tobacco in this country has been bought up at prices ranging from 11c. to 15c. per pound. So far, our winter has been warm and open. The prospects for the coming winter wheat crop are not encouraging. Owing to the protracted dry weather last fall, it made but feeble growth and the open weather with no snow to protect the ground from alternate freezing and thawing, is unfavorable for it. G. A. G.

Ohio, Shelby, Athens Co., Jan. 24.—The weather is very mild. Grass and wheat look as green as in spring. Roads—well, I guess there is a bottom, but it is a good ways down. Wheat sells for $1.35 per bushel; oats, 33 cts.; corn, 45cts.; potatoes, 50cts.; apples, 50cts.; butter, 18 cts. per pound; eggs, 20 cts. a doz. A. K. S.

Virginia, Lexington, Rockbridge Co., Jan. 24.—It looks as if we could not get any ice here this winter. The weather now is as mild as it usually is in March or April. We have had but one slight snow-fall—hardly enough to cover the ground. Wheat looks fine. Flour sells for $6 per barrel; corn, 45@50c.; potatoes, 50c.; pork, $4.50; butter, 15@16c.; eggs, 10c. J. F. S.

Wyoming Territory, Jan. 11.—The great snow wave of '80 is here. We have 3½ feet of snow on a level—the heaviest fall we white men have ever had on Puget Sound. Business of all kinds is blocked, and many buildings have fallen from the pressure of snow. Wheat is the only farm product that commands a good price. Potatoes, 20 cts. per bushel; eggs, 25 cts. per doz.; hay $8 per ton, baled and delivered. The Skaget gold mines are the present great cause of excitement all through this region. A warm rain on this accumulation of snow would cause frightful floods and loss of property. C. H. S.

Wis., Lavalle, Sauk Co., Jan. 4.—Wheat sells for $1.15@$1.20; potatoes, 20c.@30c.; butter, 14@17c.; hay, $5@$6; beef, live, $2@$3; hogs, dressed, $4 80@$5. I have just returned from Central Ohio; crops were good, except corn, which was mostly a poor crop. From my own observation I judge but little will be fit for market. W. S. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

Beets vs. Turnips for Sheep.

J. F. A., Washington Co., Mich., asks the relative value of beets and turnips for feeding sheep at this time of the year.

Ans.—According to analyses of Drs. Voelcker and Langster, the nutritive elements of the roots usually fed to sheep are as follows:

IN 100 PARTS OF	Water.	Flesh formers.	Fat formers.	Woody fiber.	Ash.
Sugar Beets	81.5	1.00	15.40	1.3	.80
Mangels	87.78	1.54	8.60	1.12	.96
Ruta-bagas	89.40	1.44	5.93	2.54	.63
Yellow Aberdeen Turnips	90.57	1.80	4.64	2.34	.65
White Globe Turnips	90.43	1.14	3.96	2.00	1.02

Of all the roots usually grown, the sugar-beet is the best for sheep, being the most palatable, and containing the greatest proportion of solid nutritious matter. Considering the large quantity of water contained in them, roots may be considered as highly nutritious food, and when fed in conjuntion with dry fodder, and in proper proportions, are greatly conducive to the health and growth of the sheep. Their effect upon the quality of the wool, especially the lustrous wool of some of the long-wooled is very favorable. The proper quantity of roots to be given depends upon the kind of sheep. As a safe guide, it may be estimated that one bushel of roots will be a sufficient daily allowance for 10 sheep weighing 150 pounds each, live weight, if along with the roots, 1½ pound of hay and ¼ pound of meal or bran per head be given. But the daily ration of roots must be apportioned with care and judgment. For lambs five to six pounds daily will be sufficient; for two-year-olds and mature sheep, 10 to 15 pounds will be ample allowance; the smaller quantity being enough for a South Down, and the larger for a full-grown Cotswold, Leicester, or Lincoln. For a Merino a much less quantity should be apportioned, as this breed cannot produce a fleece of good quality, or great weight, without being supplied with enough oily matter to secrete the large amount of yolk which their fleece contains.

Laying out a Lawn.

G. E. S., Mt. Pleasant, Ohio, asks advice about grading around a house just built. There's plenty of cellar dirt to grade with, and ample opportunity to make a beautiful lawn, sloping just enough to carry off the water. The house is about 75 feet from the road. How should a terrace be made, and when sodded? What is the best method of planting some thrifty Maples, with trunks five or six inches through? How and when should they be moved? What other forest trees would be best for lawn shading?

ANSWERED BY S. PARSONS.

If the cellar dirt is already disposed about in heaps, it should be manured heavily after grading, with ammoniated manures, stable manure, etc. Such soil is usually very poor, and a good lawn needs to be of rich soil. If you must make terraces, which are not as desirable in many ways as a regular slope, construct them low and sod early in the spring. Sodding, however, may be successfully done during more months in the year than most other lawn-planting operations. If you wish to succeed in moving large forest trees—a difficult operation at best—you must cut back the branches well, trim all roots broken in digging, and move and dig so as to retain as much of the small fibers as possible. Let such trees be planted four or five inches deeper than the crown of the roots, and even in some cases, where the soil is naturally dry, eight or ten inches. Pound the earth firmly about the roots, placing the best soil nearest the fine fibers. The Elm transplants, perhaps, most easily of all forest trees. Birches and Poplars also may be moved with fair success from the woods. Beware, however, of Hickories, Pepperidges, Oaks, etc. Ordinarily it is not profitable to transplant shade trees from the woods. A thrifty tree, one and a half to two inches in diameter, grown in the nursery, will become, in five or ten years, far more attractive and shapely than any forest tree, not to speak of the smaller risk of death incurred. To make

transplanting forest trees more sure, dig around and cut their roots the year before moving, to obtain a new set of fibers.

The Audiphone and Dentaphone.

Several inquirers ask information about the Dentaphone and Audiphone.

ANS.—We have carefully tested both of these "helps to hear" in about a dozen cases of deafness from various causes and of different degrees. In several cases neither was of the least help. In such instances the deafness was total or nearly so, had been of long standing and was caused by violence, accidental or otherwise. On a deaf-and-dumb man the Audiphone had absolutely no effect, but a deaf-and-dumb child could, what she called, "hear" singing *under* the instrument, but not before it. In neither case was the Dentaphone of any use. Indeed, in more than half the cases tested, this device was of no practical benefit, but in several instances it seemed to help materially, and considering its low price, it cannot, therefore, be classed among the "humbugs." In about half the number of cases, the Audiphone was really serviceable, but in only two out of all the tests did it give entire satisfaction. In one of these the deafness had been produced by erysipelas about 18 months ago, and in the other a child had been made deaf a year before by concussion of the brain, the result of a fall. On the other hand, a man who four years before had been made almost totally deaf by concussion of the brain could obtain absolutely no aid from either device. When the auditory nerves are severely injured, neither is worth a cent. The loss of the eye-teeth and, still more, the use of false teeth, both diminish any good effects that might otherwise result from the use of either instrument. In recent cases, and especially where the deafness was not very severe, the Audiphone gave much more satisfaction than in severe cases of long standing. From our various tests we have come to the conclusion that in cases of comparatively slight deafness, it might be worth while to try the Dentaphone, and in all cases it would be well to test the Audiphone, were it not so high-priced. The chances seem to be about even whether the device will, or will not, be of any real service, but we do not expect that more than one in ten will be entirely satisfied; yet the knowledge that no help lies in that direction, is of itself soothing to the anxious deaf man.

Feed Table—Nutritive Ratio.

G. E. N., Afton N. Y., writes:—I want a little explanation on the feed table on page 39. In the nutritive ratio column meadow hay is 8.0, clover hay 5.9; does it mean that 5 9 pounds of clover hay are worth as much as eight pounds of meadow hay?

ANSWER BY PROF. E. W. STEWART.

ANS.—This means that in meadow hay, there is one proportion of albuminoids or muscle-forming matter to 8.0 of carbohydrates, or heat or fat-forming elements, and in clover hay one to 5.9 Our inquirer will see that linseed cake is 1 to 1.4. The nutritive ratio is to show the relative proportion of these two classes of constituents. But one of fat is reckoned equal to 2.4 of carbohydrates. The nutritive ratio is found by dividing the carbohydrates and fat (increased 2.4 times) by the albuminoids. As in meadow hay, carbohydrates and fat make 43.4, divide this by 5 4 (albuminoids) and you have 8 as the quotient, according to the nutritive ratio in the table. If N. had looked at the value column, compared with meadow hay he would have seen that clover is rated at 8 per cent. more than meadow hay. Some of the early agricultural chemists rated the value of all food according to its amount of nitrogen or albuminoids, regarding the albuminoids as the only nutritious elements, but now the value of a food is calculated from the carbonaceous elements as well. Dr. Wolff takes the following as the basis for estimating the value of a food: 4½ cents for each pound of digestible albuminoids; 4½ cents for digestible fat, and 9-10 of a cent per pound for carbohydrates. Now, if the reader will turn to the table, he will see that meadow hay has 5 4 pounds of albuminoids in 100 pounds, and one pound of fat; these two make 6.4 pounds at 4½ cents, or 27.7 cents, and 41 pounds of carbohydrates, at 9-10 of a cent, or 36.9 cents, added, make 64.6 cents per 100 pounds. Clover hay calculated in the same way, amounts to 69.7 cents per 100 pounds. This is 8-100 or eight per cent. more than meadow hay, which is taken as the unit of value. We trust this will make the table clear. Those foods that have the largest amount of albuminoids are most valuable.

Vertigo (Megrims.)

S. H., Lowell, Mich., has a valuable mare bought out of a sale stable last fall, so that he knows nothing of her history. She is naturally a kind animal, but sometimes she starts up suddenly and shakes her head as if stung by a bee in the ear, and pauses a moment as if expecting to be stung again; then jumps, shakes again and acts as if furious. The entire spell seldom lasts more than five minutes and the fit never comes on more than once or twice in driving all day, but he scarcely ever hitches her up without its occurring. Sometimes she acts like a wild horse, rearing up, but generally she only manifests the above symptoms, and he asks what is the nature of the trouble and a remedy therefor.

ANS.—This is a form of vertigo—a trouble caused by disease of very different organs. Thus, the same symptoms result from tumors or effusions in the brain, from obstructed blood-vessels, from heart disease and from plethora. Of course, a careful examination is necessary before the best practitioner could give intelligent advice; and, even then, this is one of those difficult cases in which it might prove unsatisfactory. The most generally applicable treatment consists in lessening the quantity of food and giving purgatives, followed by alteratives and sedatives; but it must be evident in such uncertain cases it is worse than useless for us to lay down any course of treatment. Unless she is very thin and weak, however, light feeding may cause an improvement; and, if so, *bromide of potassium* may be given in two to three drachm doses twice a day for a week or two.

Earless Corn.

J. E. R., Morris Co., Kan., says: "In gathering corn here we often find large, nice stalks without an ear on. This is so much the case that a field of corn often looks as though it would make a much larger yield than it really does. Then, too, we have sometimes found in the same field a stalk with a good ear, that also produced a sucker with a fair-sized ear on the top of it. Can you enlighten us as to why this is so? The land is alike all over the field, good, rich bottom land. Stalks without ears on are quite common here, and we would like to know a remedy for it."

ANS.—We cannot answer why this is so, except to say that such is the nature of the variety of corn, modified by climate, soil and culture. The only way that any given variety can be improved is by selection and cross-breeding. Thus, we should select our seed corn from the most prolific stalks and from the best ears. We should cut off the tassels (male flowers) of barren stalks so as to prevent them from fertilizing fertile stalks. Where practicable, it is a good plan to raise a small plot of seed corn as far removed from all other plants as possible. As soon as the ears have set, go over the plot removing all barren or comparatively unproductive stalks.

Muscovey Ducks.

G. B. C., Hanaca Falls, N. Y., asks whether Muscovy ducks are prolific layers, good mothers, good breeders and good table fowls.

ANS.—As layers, the Muscovy, Musk or Brazilian duck—for it is known by this trio of names—is inferior to the Rouen or Aylesbury, but probably on a par with the usual inhabitants of the duck-pond. The eggs are a dull white and seldom exceed three ounces in weight. The mother is ordinarily careful of her ducklings, but the drake shows no affection whatever for them. Muscovy ducks are prolific breeders, but in a warm climate they are better layers and breeders than in northern latitudes. Their period of incubation is five weeks. The flesh of the white duck is the most delicate; that of the black, the finest-flavored; and these are also the most prolific. The bird, though a voracious feeder, is easily fattened, and excellent eating, if killed just before it is fully feathered; but it is longer in becoming fit for the table than the common duck. At first the flesh is high-flavored and tender, but that of an old bird is rather rank and tough. The female is much smaller than the male, the former seldom exceeding five or six pounds live weight, while the latter often reaches nine or ten pounds. The male pairs readily with other domestic ducks and the offsprings of the cross are large birds, often seven or eight pounds live weight, but such hybrids are said to be generally unprolific.

Applying Lime.

R. A. W., Geneseo, N. Y., asks how many bushels of good air-slaked lime should be sown per acre on a stiff clay soil plowed last fall, and on which it is desired to plant potatoes in the spring; when and how should the lime be applied.

ANS.—Forty or fifty bushels of lime per acre is the quantity generally applied. But because lime is useful in one case, it by no means follows that it is useful for every crop. It is most useful when clover or grass is to be sown, and the usual practice is to apply it when fall grain is sown to be followed by clover in the spring, or on a summer fallow. Potatoes are injured in quality by freshly applied lime. They are made hard and will not boil soft or mealy; peas, also, are made hard by the use of lime. Oats, too, are injuriously affected by lime, while corn, wheat and clover are benefited. These are crops that are assisted more by mineral feeding; while oats, potatoes, peas, and some other crops require barn-yard manure more than mineral fertilizers. To use lime indiscriminately is therefore not advisable. Lime is *always* to be spread on plowed ground and harrowed in, and *never* to be plowed under. Being fine and heavy, it soon sinks downwards, and after three or four years will be found settled to the bottom of the furrows.

The Rural Only.

H. D. C., Clayton, Del. and others ask if we have "Ennobled Oats" for sale by the bushel, and the price.

ANS.—Such inquiries come from our *new* friends (may they prove steadfast in the ratio of their numbers), who are not aware that we make a *Specialty* of *selling* nothing whatever except the RURAL NEW-YORKER. Our seeds and plants are free to all yearly subscribers who apply and who care enough for them to be willing to share with us the postal charges, according to our announcement in our Fair No., and in our Supplement which will be sent free to all on application. Most of the seeds we offer are specialties which *cannot be procured*, except through our Free Seed Distribution. We guarantee every seed to be of last season's production, and as choice and valuable of their kinds as any novelties offered either in this or any other country. We have no disposition whatever to be modest or reticent as to the value of our seeds, or to have them associated with the ordinary seeds which may be found in any one of the hundreds of seedsmen's catalogues of the country. We have been at too much pains to secure them, and they have cost us too much for that. We have a pride in this matter, and aim to be the first either to introduce or to popularize improved or new varieties.

Value of Barley, Corn and Oats.

W. S. H., address mislaid, asks what is the relative value of barley as feed for cattle, especially for milch cows, as compared with corn or oats.

ANS.—Barley has a larger percentage of albuminoids, and consequently furnishes a better food for supplying the caseine in milk, but corn has some excess of oil over barley but not over oats. Oats, however, have more husk and not as much digestible food per hundred pounds as either barley or corn. Corn is the richest in starch, which goes to support animal heat, to form the milk sugar or whey and perhaps the oil in milk. It is generally conceded that corn meal is most excellent food in the production of butter. It does not increase the quantity of milk as much as barley or oats. Now this statement of the peculiar qualities of these foods shows that the best food can be only obtained by mixing all these together. Each one possesses some qualities the others do not, and the feeder should study, not to find the best single food, but how to combine the best food from the variety which he has at hand. Variety is required to make the best food.

The Chichester Rifle.

H. J. S., Rochester, N. Y., and several others asks what is the character of the rifle advertised by circulars by the Chichester Rifle Co., of Jersey City.

ANS.—We visited the store of the Co., to find out all about this weapon, and saw there a large assortment of them. They are certainly, as advertised, a new style of rifle, much resembling a lanky, overgrown pistol, or like some of the air-guns frequently seen in gun-smiths' windows. The cut in the circular, several of which have been sent us, represents great execution done at long range by this formidable weapon, but we are strongly impressed with the conviction that there is more "long-bow" than rifle shooting about the concern. It *may* be worth the price as a boy's dangerous play-thing, but any one who sends on $4.50 expecting to get a rifle worth at least double the money, is pretty likely to be vexatiously disappointed. It seems designed for target practice.

Grapes.

R. A. W., Genessee, N. Y., asks where can he obtain the following Grape-vines:—Uhland, Downing, Ithaca, Imperial, Don Juan, Cassady, Marine's Seedling, Onondaga.

ANS.—Uhland can be had of Bush, Son & Meissner, Bushburg, Mo. Downing or Ricketts's No. 1. is still in the possession of the originator, Jas. H. Ricketts, and has not yet been offered for sale. Ithaca originated with Dr. Parker, Ithaca, N. Y., and has not, we think, yet been offered to the public. Don Juan and Imperial are now in possession of Messrs. Merrell & Coleman, Geneva, N. Y., and have not been offered for sale. They own the stock. Cassady is now so nearly obsolete, it is doubtful if vines of it can be had. A. Hance & Son have vines of it in their Trial Vineyard, and can probably supply grafts. Marine's Seedling and Onondaga must be new sorts not yet offered the public—at any rate they are new names to us.

A Spavin "Cure."

W. S. M., Bendersville, Pa., asks whether Kendal's spavin cure, sold by W. H. Schieffelin & Co. of this city, is a humbug.

ANS.—This firm is one of the largest dealers in drugs in N. Y. city or in the country, and would not deal in humbugs. They say, however, that they have no personal knowledge of the merits of this "cure;" but that no complaints have reached them with regard to it, though they have sold a great deal of it, and it has therefore been tested very extensively.

Miscellaneous.

J. B. T. W., St. Charles, Ill., asks, 1, what are the constituents of what is there called sugar-corn meal; 2, would it be injurious if fed to dairy stock; 3, about what is its comparative value as compared with wheat bran for that sort of stock.

ANS.—1, We know nothing of the feed. It is, quite likely, the refuse of corn after extracting glucose for the adulteration of the cane sugar and sirup of commerce; 2, if so, nearly all the sugar and starch are extracted, and there would be a heavy discount on its value; pure corn meal is worth little more than wheat bran as a dairy feed, even less for simple milk. This would probably be worth far less; 3, can't say about injurlousness. Sulphuric acid is used in obtaining glucose. We shouldn't like to risk the feed without analysis. Submit samples to the Ill. Agr'l. Col. Chemist.

A. K., Shelby, O., in cribbing his corn found a double ear 8½ inches long, 10½ around, solid for two inches, then there were two well-formed ears, one 16-rowed; the other 14-rowed, containing altogether over 1900 grains, and he asks whether such things are rare, and whether the seeds would be likely to reproduce double ears.

ANS.—Such abnormal growths are not very rare. We have seen three ears joined at the bottom. We have never seen them, however, so large as the twin ears above described. Twin apples or fruits of any kind are homologous cases. Such monstrosities are rarely reproduced in their seedlings.

W. S. H. asks, 1, Whether Heik's Nursery Co., of Dayton, Ohio, is reliable; 2, what are the qualities of the Weaver plum; an agent of the above firm has been selling specimens at $1 per tree, warranting them to be hardy and curculio-proof, and showing specimens preserved in alcohol in glass jars.

ANS.—1, The above company is represented to be of "excellent" standing by the mercantile agencies here. 2, We have never heard of the Weaver Plum. There is no such thing as a curculio-proof plum (as we believe) that is fit to eat. All standard fruits are described in horticultural papers and books. Persons ought never to be influenced by the appearance of fruit in jars displayed by strangers.

A. S. S., Waco, Texas, asks the name of a good standard work on the propagation of fruits and flowers, its price and where it can be had.

ANS.—We do not know any single standard work treating of both subjects. For fruits, Thomas's American Fruit Culturist is as good as any. Price $3.75. For flowers, Henderson's Floriculture is good. Price $1.50. Both can be had through the American News Company, N. Y.

E. P., Verbeck, Kan., asks where he can buy evergreens and if he can raise evergreen trees from seeds.

ANS.—Of R. Douglass, Waukegan, Ill. If correspondents would take the trouble to consult our advertising columns, they would find a great many such questions answered satisfactorily. We advertise none but reliable firms. Evergreens are easily raised from seed.

SEVERAL.—Regarding the Doura—or that particular kind of Doura of which we wrote as sending up at least eight stalks from one seed—apply to R. H. Allen & Co.—see advertising columns. Judging it from one season's test at the Rural Farm, it was pronounced by the farmers thereabouts the most *profitable* fodder plant they had ever seen. We should like to have our inquirers send for a small quantity, try it, and report the results to the the RURAL NEW-YORKER.

O. L. S., Canastota, N. Y., asks, 1, what is the best work on apple culture; 2, its price; 3, where can it be bought.

ANS.—1, Thomas's American Fruit Culturist is as good as any; 2, $3.75; 3, from the American News Co., N. Y. City.

O. C. D., Wellville, Va., asks what is the best kind of corn to plant for fodder in drills.

ANS.—For that section Blount's White Prolific is likely to be as good as any for that purpose. Try it.

F. B. Columbia, Pa., wants to know if red cedar posts will last as long in the ground as locust posts.

ANS.—Locust is more durable.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JAN. 31st.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, FEB. 7, 1880.

SHORTLY TO APPEAR.

On The Kinver and an entirely new French Yellow Globe Mangel as sweet as a sugar beet and as productive as other mangels—illustrated.

Leguminous Plants—grasses and valuable fodder plants, by Professor W. J. Beal—illustrated.

Stock Notes by Professor E. W. Stewart, L. S. Hardin, Richard Goodman, M. C. Weld, Col. F. D. Curtis, A. B. Allen and others.

Important Addition to the Rural's Seed Distribution.

Special Articles from Professor S. W. Johnson, Professor F. H. Storer, Professor G. C. Caldwell, Dr. A. R. Ledoux.

A Series of short articles upon the cultivation of our choicest vegetables—illustrated.

Dairy Specialties by Henry Stewart, L. S. Hardin, Professor L. B. Arnold.

Fruit Notes by Pres. T. T. Lyon, Gov. Furnas, Dr. T. H. Hoskins, Sec. Garfield and others.

Poultry Notes by Forrest K. Moreland, Henry Hales and others.

Life Engravings of the Chinese Yam (Dioscorea batatas) "Cinnamon" vine; the Tulip tree and fruit &c., &c., &c.

TO NEW SUBSCRIBERS.

We find that many of our new subscribers have not seen our Free Plant and Seed Distribution supplement and consequently know nothing as to its terms. We will therefore send this supplement free to all who apply until further notice.

As originally announced in our Fair No. of Sept. 6, the Plant and Seed Distribution will be completed about March 1st. This for the benefit of our new subscribers.

The Rural New-Yorker, from careful tests and inquiry, confidently recommends to its readers the following Peas as among the most desirable in cultivation:—For earliest, Early Dan O'Rourke. Philadelphia is the earliest pea and the poorest. Alpha (Laxton) bears balloonish pods, but the vines are prolific and the peas large, very green and delicious. For second early, McLean's Little Gem is best. This is ready for the first picking about one week later than Dan O'Rourke. For an early pea that grows to such a hight that it does not absolutely require brushing, and for general excellence, this is very generally placed first. The American Wonder matures at about the same time and is the only variety that disputes a claim to the first place with the Little Gem. Champion of England and Eugenie we prefer for the main crop, and British Queen for the latest.

An armed truce is the condition of Europe. The Continent is a vast camp; the best efforts of every nation are directed towards rendering its army as numerous, as efficient and as thoroughly prepared for instant action as possible. Jealousy, revenge, dread of reprisal, lust of conquest and aggrandizement, hatred and distrust—all combine to hasten the advent of the next war. When it comes, it will not be a struggle between two nations; the probability is that nearly the whole Continent will be involved in its sulphurous fumes, and that neither the Channel nor the shop-keeper's love of peace will be able to keep Great Britain from voluntarily entering or being forced into the fray. The advanced age of most of the chief leaders, such as the emperors William and Alexander, and of Gortschakoff, Beaconsfield, Bismarck and Von Molkte, may at first glance seem a valid cause for shrinking from the toil and strain of warfare; but each of them knows full well that the conflict must come soon, and the Germans at least, confident in their present superiority, must naturally wish to precipitate the inevitable while their country is well prepared for the struggle, and while they themselves are in a better condition than they ever can be in the future to guide their legions and share in their triumphs. It looks therefore, as if war might break out at any time, and though we must deplore a calamity so terrible to humanity, we cannot forget that it would be an excellent thing for neutrals.

THE JURY DISAGREE.

Not an uncommon occurrence—nor, when it occurs, should it be unexpected. Questions usually referred to juries are such as in civil cases the parties interested are not able to agree upon themselves, and in both civil and criminal are usually covered with masses of conflicting evidence of persons who are willing, perhaps, but unable to see the same things in the same light. And what is the edict of the law? It says you shall see alike, no matter what your organization, your power of sifting evidence, your ability to judge of the trustworthiness of witnesses from their general appearance, or to reject the sophistries and special pleadings of the attorneys. The law says you must and shall think as the men on your right and on your left think, or failing to do so, you shall be kept as prisoners during the pleasure of the Court, which has the power to confine you day and night without fire or food, or without beds or bedding, or even comfortable places to sit, until you force your conscience to such a point as to be willing to tell a lie in the cause of justice (!) and say one thing when in your inmost soul you believe another.

He who writes this has sinned with the rest, and from his experience in the jury-room is of the belief that not one verdict in ten gives the true opinion of one-half of the jurors. Verdicts in civil cases are usually the results of compromises, especially where damages or other money awards enter into them. All who know about them are well aware that it is not unusual to take the sum each juror thinks right and proper, add them together and divide them by 12, to arrive at a just and legitimate conclusion, on the ground that the average of the opinions is likely to be nearer right than that of any one, and on that ground individuals excuse themselves from receding from their conscientiously formed beliefs. In criminal cases where the verdict must be guilty or not guilty, it might seem that an agreement would be more easily reached. But this is not so; there is in the mind of every man a fear of doing an injustice that cannot be undone. The Court instructs that the prisoner shall have the benefit of any doubt. Much, if not all, of the evidence of guilt must be circumstantial, and circumstances which to one would seem to be overwhelming proof, to another are not worth a moment's consideration, and both are equally sincere and honest. It is not in the possibility of their natures to see things alike—but the law says they must. Sometimes they defy the law and remain in a state of disagreement until the Court discharges them, leaving the case in the same condition as before the trial commenced.

The result of the recent Hayden trial in Connecticut, where after a long and tedious trial of three months, the jury did not agree, eleven being for acquittal and one for conviction, should, it seems to us, awaken public thought to the necessity of the correction of jury law. We have nothing to do with the merits of the case, but merely present it as one where immense sums of money have been spent in its prosecution and defence, and the case is just where it was before the trial commenced. The prisoner, neither convicted nor acquitted, has been released on $5,000, bail and should the State no longer prosecute, Mr. Hayden must continue to live as a man charged with murder, tried and not acquitted. If it be thought necessary for 12 men to agree before a verdict be decided upon, we should not object; but they should agree by their own volition and not by force. If we were members of any of the State Legislatures now in session, we would strive to have a bill passed providing that two-thirds or three-quarters of any jury should agree. If that proportion of twelve men is not sufficient, then let the jury consist of sixteen. When the jury retire, the foreman should invite expressions of opinions, or discussion of the merits of the case, and when the question was submitted to vote, the first one should be final and decisive of the matter. The questions would be differently framed for civil and criminal cases, but the result would be the same—the first vote should decide.

But as we are not legislators, we send this out to our readers, some of whom are, in hopes that it may awaken attention to the subject, and, like a little leaven, continue to work until this reformation of our statutes, so much needed, shall be accomplished.

THE VALUE OF A DOLLAR.

We once employed for a short time in ditching, a man who at twenty-one years of age was worth some fifteen thousand dollars, but who lost most of it on the whole foolishly, and was compelled, for a time, at least, to support his family by working for daily wages. One night when we paid him, he said, "I'm much obliged both for the wages and the tuition." We supposed he referred to instruction in laying tile-drains, but he said "No, I mean instruction as to the value of money. I never knew what a dollar was worth before. But after working all day in the ditch to earn one, I'm not likely to spend twenty-five cents of it for a cigar or any other nonsense."

We could point out scores of city boys who have become miserable spendthrifts from the lack of just such knowledge. Their fathers were more or less wealthy, but the sons were not put into the office, or mill, or shop, and made fairly to earn their money by tiresome labor, either physical or mental. Their fathers said to themselves: "My sons shall never have to drudge as I did," and so the boys did *no* labor, bore no responsibility and never learned how money was fairly and honorably earned, and, of course, never knew its value or its proper use.

In a certain rural district we know, we can count, within a radius of ten miles, more than as many young or middle-aged farmers who have since their majority, "run through" from ten to thirty thousand dollars each, that their hard-working fathers left them; and all because they never learned the *value of a dollar*. One such, on his sudden accession to his property, thought to impress some of his young friends at a hotel where they had stopped for dinner, by spreading a hundred dollar bill on his slice of bread and butter and eating it with great apparent relish. He did "impress" the one he might have married, with the belief she had better not marry a man who was both spendthrift and fool; and the young man in less than twenty years saw the time when he was glad to get the bread and butter, without the hundred dollar bill for a relish! In youth he had never been taught to labor, had had a large stock of spending money compared with the other farmers' sons, and supposed the only limit to the amount was "the old man's stinginess."

Sometimes the same evil results follow a very different and "heroic treatment." We have in mind a well-to-do farmer who kept his sons at severe farm labor from early childhood and never gave them any spending money or any chance to earn it, or any interest in farm or stock, or in the profits of their labor. Of course, they hated farming. Of course, they wanted spending money, like other boys. Naturally and actually failing to get it otherwise, they "took" butter, eggs, maple sugar, etc., and sold them to procure it. *He* called it stealing, "thrashed" the boys severely and put such valuables under lock and key. *They* called it "taking" a small part of what they earned, and finally ran away from home and left "the old gent" to find other boys, and *pay them* for their labor.

But the subject grows upon us. Examples multiply in our memory, of the sad results that have followed unwise teaching, or no teaching, in regard to the value and proper uses of money. We merely wish to say, we believe children, especially boys, but girls also, in whatever station in life, should be taught to earn, to lay up, and wisely to spend money. If born to a heritage of wealth, they should be taught that its possession brings greater responsibilities, and its proper management, when they grow up, will bring even a heavier tax on their mental and moral powers and faculties, than would the earning of a livelihood. We think they should even be taught some useful employment or mode of earning money, both as a discipline and safeguard. We have great sympathy with the English and Continental occasional practise of teaching even the sons of wealth some useful employment. We believe wealthy parents should teach their children wisely to manage their estates, so that they shall not be compelled to will them away lest they be squandered by their heirs.

On the other hand, if children are born simply to a heritage of labor, we believe they should be taught that labor is no disgrace, and taught how to labor well; lay up and invest their earnings wisely, and gradually in this good land relieve themselves of the necessity of oppressive over-wearisome toil. We believe that children after in some way earning money, should be permitted to invest or spend it, under general advice if they seek it, as they on the whole choose, at least for a time. They should be permitted to choose in childhood, and if possible, taught to choose wisely. How shall they learn to choose wisely in manhood if they are never permitted in childhood to choose, and even to choose unwisely, but gradually taught to choose wisely. "Poor Richard's" silly purchase of the whistle taught him a lesson, and was, on the whole, the best bargain he ever made. A few pennies, dimes or even dollars, unwisely spent in childhood, nay, spent in utter foolishness, and regretted in bitterness, may save in manhood the squandering of a fortune, or the wreck of a life.

BREVITIES.

It now appears that the "Washington Market" sweet corn is the "Egyptian" sweet corn.

Those who have learnt "The Value of a Dollar," are generally those who prefer to pay as they go.

Englishmen should read the speech of Horatio Seymour before the State Agricultural Society. It will tell them as well, perhaps, as the reports of Messrs. Read & Pell, the cause of their "agricultural distress.

A Syllogism.—A weed is a plant the object of whose existence has never been discovered. There are a great many men, the object of whose existence "no fellah" can find out. Therefore, a great many men are weeds!

"It might be shown," says Horatio Seymour, "that the extremes of heat and cold in the northern belt of States, will ever be among the most important influences in stimulating the energies, the prosperity and civilization of the American people."

The Germantown Telegraph has never had a specimen of the Clairgeau Pear (grown on quince stock), that has been fit to eat. We have never heard of an instance of its attaining any excellence as a dwarf. But on pear stock, though quite variable, it is sometimes very good.

All subscribers wishing our seeds and plants should send six cents' worth of postage stamps—that is, two for the seeds—four for the Raspberries. The rest of the postage and all other expenses we bear. All who have not seen it, should send for our seed supplement which explains the whole matter.

Here is Doctor Chamberlin's acknowledgement of the prize won in the contest for the greatest yield of Blount's Prolific Corn, and paid by The Rural New-Yorker: "Draft of one hundred dollars came all right, for which receive thanks." The other seven successful competitors have not yet favored us with any acknowledgment of the receipt of their prizes.

Inexperienced fruit growers in selecting plants, are too prone to look at the top and to *overlook* the bottom. We would impress upon them the fact, that unless the roots are well developed and covered with small or fibrous rootlets, the *less* top the better. In selecting grape vines, e. g., the roots are all-important. The canes should be cut almost entirely away. It is *never* economy to purchase old vines.

We see an advertisement going the rounds indorsed editorially by some journals, of a tomato *very much* earlier and *much* better than any other variety. This is hard to believe. It might be, perchance, one or the other, though that would be saying a good deal—but we cannot believe it is both. It is probable that we have reached the limit of earliness in the tomato and that further increments in this direction will be made only at the sacrifice of quality.

It will be seen by those who read the Department "For Women," that Miss Ray Clark takes the position made vacant by the retirement of Miss Faith Ripley, who has ably and faithfully conducted it for several years past. We respectfully commend Miss. Clark to the entire confidence of our lady readers, assuring them that their inquiries, or communications of any kind, will receive prompt attention. It is, indeed, one of the objects of the Department that lady readers should therein communicate freely with each other, while the Department in this way is made interesting and instructive to all.

While we have shown our disposition to exclude all untrustworthy advertisements from our columns, and while we intend to exercise the same or a greater degree of caution in the future, we are the more desirous that those who *do* advertise in our columns should be made to know the value of this journal as an advertising medium. If our readers would kindly mention the Rural New-Yorker in any correspondence they may hold with advertisers, they would assist us in this matter. The increase in our circulation up to this date has been all that we could reasonably have asked, and we shall strive in every way in our power to prove to our readers as well as to our advertising patrons that we shall make generous returns for their confidence and support.

Peter B. Mead tells us, in speaking of remedies for plant insects:

If your "old man" smokes, utilize him, and put a plant before him with every pipe. The novelty of this thing will amuse him at first; but he will probably tire of it after a while. Keep him at it, however. Reason and wrestle with him. Tell him how bad it is for the bugs and how good for the plants. Keep him down to it. In the end, he will either give up smoking or take to the work kindly with the consciousness that at last he is doing some good in the world. Then your turn will come. Take him in your arms and kiss him and he will be the happiest man alive. There is too much smoke that does no good in the world.

The interesting article from which we take the above, will appear in an early number of the Rural.

Pomological.

SELECT APPLE LIST OF NEBRASKA.

We are indebted to Gov. Furnas for the following Report of a Special Committee of the Nebraska State Horticultural Society:

In 1877 the Nebraska State Horticultural Society announced a "Select list" of seven varieties of Apples, best suited in all respects, to culture in the State, both for market and family purposes; two summer, two fall, and three winter. These were Carolina Red June, Cooper's Early White, Malden's Blush, Fameuse, Rawle's Janet, Ben Davis, and Wincsap. An additional list of 12 varieties was given, adding to the foregoing, Red Astrachan, Rambo, White Winter Pearmain, Domine, and Talman's Sweet. At the meeting, January, 1879, the list was increased and slightly changed by adding Sweet Bough, Duchess of Oldenburg, Porter, Peck's Pleasant, Bailey's Sweet, and Willow Twig, and substituting Jonathan for White Winter Pearmain, the latter having of late "scabbed," so badly as to render it almost worthless. The Jonathan being further tested, has given universal satisfaction, and was therefore placed in its stead.

At the meeting last named the undersigned were appointed a special committee to prepare and present the points of excellence claimed, and found to exist in Nebraska for the list as it now stands, giving a full description of every variety. In furtherance of the objects for which the committee was appointed, the following report is presented:

The descriptions are principally from "Downing's Fruit and Fruit Trees of America," to which are added the peculiar or particular characteristics obtained by experience in Nebraska. The list presented has had twenty years' experience in the State and Territory. In every instance the varieties presented have shown greater size and finer color than Downing's descriptions call for.

While there are many other varieties, so far as tested, that show themselves well adapted to the soil and climate—and it is believed time and further experience will give them a place on our "select list"—the list as it now stands, comes as near perfection, in all essential requisites, as the Society has been able to find, coming within the limits of the number of varieties named. The General List *recommended* heretofore at various meetings of the Society, as having been found worthy so far as tested, has not been changed.

Summer Varieties.

Red June.—We call this apple simply Red June. The proper name, as given in standard pomological books, is "Carolina Red June." Tree very vigorous, upright; an early and very abundant bearer. Fruit, medium size; skin, smooth, deep red, sunny side almost purple, with light bloom; flesh very white, tender, juicy, brisk sub-acid; ripens after early harvest; fair table, excellent market.

Red Astrachan.—It is a Russian apple—hardy as an oak. Tree vigorous, upright, and an abundant and regular bearer; a little tardy coming into bearing; fruit rather above the medium, smooth, roundish; in sun, deep crimson; in shade a little greenish-yellow; flesh, quite white, crisp, moderately juicy, rich acid; not first quality for eating; good cooking and valuable for market. Ripens July to August.

Maiden's Blush.—Tree rapid grower, spreading head, and bears large crops; fruit medium, skin smooth, waxen appearance, pale yellow in shade, brilliant crimson next to the sun; flesh white, tender, sprightly, pleasant sub-acid; good for both table and market. Ripens from last of August to October.

Sweet Bough.—Known in our Society, and generally, by that name. Catalogue name, "Large Yellow Bough." Tree, moderately vigorous, round head, abundant bearer; fruit above medium, oblong, ovate; skin smooth, pale greenish to yellow; flesh slightly creamy, crisp, rich, sprightly, sweet; one of the best early sweet apples. Ripens July to August.

Cooper's Early White.—Has been tested by Mr. Masters, particularly, for 20 years. Is of Western origin; was brought to Nebraska by Mr. M. Its quality is above medium as an early variety; tree strong, robust, rather rough-looking; little tardy coming into bearing; fruit medium, roundish, little flattened, pale yellow waxened appearance, with a faint blush tinge of green at the stem; flesh white, crisp, sprightly; fruit makes a fine appearance; at our exhibits, at home and abroad, has attracted more attention than any other variety raised in the State; handles well, sells well, and is valuable in all respects.

Duchess of Oldenburg.—A Russian apple; while not of first quality, it always finds ready sale. Tree vigorous; head spreading; requires little or no pruning; fruit medium; skin smooth; finely marked and streaked with red, on a golden ground; flesh juicy, sprightly sub-acid; ripens late, August to early September; is a fine market variety, but must be handled at once, when ripe and ready.

Autumn Varieties.

Fameuse.—An old French variety, from Canada; tree moderately vigorous; round head; fruit medium, roundish, somewhat flattened; skin, ground of pale red on shady side, fine deep red in sun; flesh remarkably white, very tender, juicy, with slight perfume; a valuable market sort.

Rambo.—Tree vigorous, spreading, productive; fruit medium, flat smooth, yellowish white in shade, streaked and marble with pale-yellow in sun, and speckled with large rough dots; flesh greenish white, very tender, rich, mild sub-acid; good for table, kitchen and market; ripens October to December.

Peck's Pleasant.—Tree moderately vigorous, spreading grower; fruit above medium; skin smooth; when first gathered green, with a little dark red; when ripe, beautiful clear yellow, with blush on sunny side; flesh yellowish, fine-grained, crisp and tender, with a delicious, high, aromatic, sprightly, sub-acid flavor; commands high price in market where known; November to March.

Bailey's Sweet.—Tree vigorous, spreading, productive; fruit large, roundish conical, obscurely ribbed, yellowish, striped with red and sprinkled with minute dots; flesh white, tender, not very juicy, almost melting, honeyed sweet flavor; ripens November to March.

Porter.—Tree moderately vigorous, forming low, round, spreading head; fruit rather large; color clear, glossy, bright yellow, dull blush next to sun; flesh fine-grained, sprightly, agreeable, sub-acid; valuable market fruit; ripens in September.

Winter Varieties.

Ben Davis.—Tree vigorous, round, erect head, bearing early, regularly, and abundantly. Fruit above medium to large. Form roundish, truncated, conical, often sides unequal, splashed and striped with two shades of red. Flesh white, tender, moderately juicy, pleasant sub-acid; is not No. 1 as to quality, but one of the very best market varieties; keeps, handles and ships better than almost any other variety; is a beautiful and attractive apple, and, consequently, always sells well; is pronounced, generally, "the apple for the million."

Winesap is so well known everywhere and by everybody, that description seems almost needless. Tree rather irregular, not forming a handsome head; a vigorous and rapid grower; comes into bearing early, and bears regularly; very productive—holds its fruit late without injury—fruit medium, rather roundish—skin smooth, dark red—flesh yellow, and of a fine, crisp, rich, high flavor—ripens November to May—one of the best both for table and market.

Domine.—Tree a rapid grower, early and prodigious bearer—fruit almost fac-simile of Rambo in appearance, only a more lively color—a sprightly, juicy, long-keeping, winter variety—it is excellent from December to April.

Talman's Sweet.—Tree upright, vigorous grower, and very productive—fruit globular—when ripe, whitish yellow, soft blush on one side—flesh quite white, rather firm, fine-grained, and of a rich, sweet flavor—probably one of the best market sweet apples—ripens November to April.

Jonathan.—Tree vigorous, upright, spreading, round head, hardy, and very productive; an early and regular bearer; fruit medium, regularly formed, roundish, conical, or tapering to the eye; skin thin and smooth; ground clear, light-yellow, nearly covered by lively red stripes, deepening into brilliant red in the sun; flesh a little pinkish, very tender, juicy, with a high vinous flavor, almost equal to Esopus Spitzenburgh. With those who have tested it in Nebraska thoroughly, it is called "the coming apple." Its quality is superb as a table apple, and, when well known, it will always command good prices in the market; it is not so long a keeper as many other varieties. Thus far, the Jonathan has shown no "ills," and is good almost from the time of gathering.

Rawle's Janet—more familiarly known as "Janetting," "Gannet"—has a host of synonyms. Tree vigorous and spreading, not an early bearer, but regular when it comes into bearing; a later bloomer than any other variety, thus avoiding late freezes. For this reason alone, it is particularly valuable with us; fruit rather large, yellowish; shaded with red and striped with crimson; flesh whitish-yellow, tender, juicy, pleasant, sub-acid, is both excellent and popular, a good keeper, one of the most valuable market varieties; it is classed in Nebraska, "Iron-Clad."

Willow Twig.—Tree vigorous, spreading somewhat drooping; fruit medium, light yellow, with russet dots; flesh yellowish green, not very tender; pleasant sub-acid; valuable for late keeping, and of the best market varieties.

Robert W. Furnas, E. N. Grennel, V. C. Utley, Hiram Craig, J. T. Allan, Samuel Barnard,

Recommended List.

At the annual meeting of the State Horticultural Society, March 1, 1875, J. H. Masters, Hiram Craig, R. W. Furnas, S. B. Hobson and J. T. Allan, were appointed a committee to revise the list of fruits recommended for general cultivation, and instructed to report only those varieties which had been thoroughly tested and proved successful.

The committee made the following report, which is not as extensive as it might have been, as it is deemed advisable not to recommend too many varieties, believing it best to give attention to those which are most desirable for profit, combined with excellence of flavor:

Summer Apples.—Early Harvest and Summer Pearmain, first quality; Early Pennock; Buffin's Early, best early variety; Williams' Favorite.

Autumn Apples.—Jersey Sweet, hardy and reliable; Gabriel, one of the very best; Fall Wine; Drap d'Or, very hardy; Hubbardston Nonsuch, a good bearer.

Winter Apples.—White Winter Pearmain, very successful; Yellow Bellflower; Roman Stem, good for late winter; Clyde Beauty, excellent for early winter; Grimes's Golden Pippin, of fine quality; Swaar; Perry Russet, very profitable; Esopus Spitzenburgh; Northern Spy; Red Detroit, hardy but slow bearer.

The committee appointed at the last meeting of the Horticultural Society add to this list the following:

Early Red Streak, Sweet June, Autumn Strawberry, Autumn Swaar, Early Trenton, Sops of Wine.

Miscellaneous Fruit List.

The fruits in the following list have all been well tested in Nebraska from ten to twenty years, and are presented by the State Horticultural Society, as, in most respects, worthy and reliable.

Crabs.—Transcendant, Hyslop, Hewes.

Pears.—Summer—Rostiezier, best early; Bloodgood, early and good; Doyenne d'Ete, small, very sweet; Buerre Gifford.

Autumn—Buffum, an erect, strong grower, bears well; Howell, ranks among the best; Seckel, unsurpassed in flavor; Duchesse d'Angouleme; Buerre Diehl, fruit large, a good bearer; Louise Bonne de Jersey; White Doyenne, a prolific bearer; Sheldon, does well; Doyenne Boussock, a strong grower; Buerre Bosc, recommended by the president.

Winter—Buerre d'Anjou, best winter pear; Lawrence, does well; Vicar of Winkfield.

Cherries.—Early Richmond, best for profit; Belle Magnifique, very successful; Reine Hortense; English Morello, very profitable; May Duke.

Plums—Jefferson, Miner, Lombard, Green Gage, German Prune, Imperial Gage.

Peaches.—Hale's Early, Crawford's Early, Early York, Stump the World, Troth's Early, George IV., Smock, Crawford's Late, Ward's Late, Morris White, Old Mixon, Early Beatrice, Amsden, Alexander, Newington Free, Jacque's Rareripe, Heath Cling.

Apricots.—Breda, Moorpark, Early Golden, Peach, Hemskirke.

Grapes.—Concord; Hartford Prolific, best early; Delaware, better than Concord and equally hardy; Iona, Ives's Seedling, Martha, Creveling, Lumelan, Salem, Goethe (Rogers's Hybrid), very fine and hardy.

Strawberries.—Ellsworth, Agriculturalist, Green Prolific, Wilson's Albany.

Blackberries.—Early Wilson, very reliable; Kittatinny; Snyder.

Gooseberries.—Houghton's Seedling, Whitesmith, Cottage Girl, Smith's Improved.

Currants.—Red and White Dutch. White Grape, Cherry Versailles.

Those who grow fruit for market will find a very great advantage in assorting fruit before placing it on sale. A few extra apples in a barrel or basket show an unfavorable comparison with the inferior. A few inferior destroy the value of the superior. Perfect apples, of uniform size, color and shape, always command superior prices. Better throw away the inferior than mix them with the extra and select. In matter of transportation, it costs as much for the poor as the good. Sales and profits are largely in favor of the latter.

Planting Fruit Trees.

For an orchard of Standard Apples, Pears, Cherries, Plums, Apricots, Prunes, Peaches, Nectarines and Quinces, the soil, excepting new grounds, should, before planting, be made mellow by repeated plowing, and kept constantly cultivated for several succeeding years. For this purpose, potatoes, beets and other low-headed crops are best, as they give the trees the frequent benefit of the plow, cultivator and hoe, and leave them in the full enjoyment of the necessary stimulants of the air and light. Every species of fruit tree and plant prefers a peculiar soil in which it flourishes best, and requires less manure and culture, producing better fruit than in soil less congenial, yet so different are the various species that almost every soil, from the peat bog to the sandy plain, is adapted to fruit, and all the intermediate soils between these wide extremities are adapted to various species.

The first care on getting trees home should be to dig a hole in the ground, fill it with water, stir in enough soil to make it moderately thick, and then plunge the roots of the trees in it until they are thoroughly coated with mud. Then keep trees of each variety tied together as they are received (unless the branches are so large that the soil can not reach all the roots, in which case they should be divided), "heel them in"—that is, bury the roots, to the depth of four or five inches, in loose, well pulverized soil, in such manner that when ready to plant, you can pull up each variety by itself, without uncovering the remainder. By so doing, you will have the root of each tree damp and in good condition when planted. As trees are often killed and always injured by being left to the mercy of the hot sun or cold winds until all can be regularly planted, it will be seen that these precautions are very important.

Should trees be received in a wilted or frozen condition, as is sometimes the case from unavoidable detention on the road, they should be at once buried in the earth to within a few inches of the tops, and there left until they recover. If frosted however, the roots should not be touched with the hands, or subjected to the rays of the sun or any artificial heat, before they are placed in the ground.

Let the hole be dug from eighteen to twenty-four inches in depth, and large enough (the larger the better) to receive the roots without cramping; throw back and scatter the sub-soil, and partially fill the hole with good surface earth, so as to fit it for the tree to stand about as deep as when in the nursery.

Prune off the ends of the roots, leaving them fresh and free from bruises, and put the tree in the place prepared; cover the roots lightly with rich, mellow earth, pour on water, and work the tree gently up and down, alternately adding earth and water until every cavity is well filled; or, better, work the earth thoroughly among the roots with the hand.

Trim up the tree to four or five limbs suitable to form a top, and cut each of the side limbs back to a bud, within four or five inches of the body, leaving the central, or leading, limb from eight to twelve inches long; but where there are no side limbs suitable for this purpose, the tree should be divested of all its branches and headed back to a hight proper to form the top. If planted in autumn, this pruning should be deferred until early in the spring; but it should by no means be neglected altogether, as nothing so much conduces to the success of transplanting and to the subsequent beauty and prosperity of the tree.

If the trees come to hand while the earth is too wet to receive them, bury their roots until the condition of the earth is more favorable. If the roots become dry from too long exposure, place them in water, and let them remain there from eighteen to twenty-four hours. To protect them from the drought, nothing is so effectual as to spread a covering of straw, loose litter or leaves about their roots after the transplanting is completed. This keeps the earth light and moist, and renders the too often injurious process of watering unnecessary.

AGRICULTURAL NEWS.

A company has been organized to construct an irrigating canal from the Platte River, Colorado, eastward to the great plains south of Denver. Length 86 miles; width 20 feet; depth several feet, cost $100,000, results the cultivation of 60,000 acres of the finest wheat land in the Union....In Lawrence Co., N. Y. 200,000 cows net $5,000 a day profit on their milk....The Ayrshire Breeders' Association held their annual meeting lately in Boston. In the treasury $908.33. It was voted to petition Congress for stringent legislation relative to stamping out pluro-pneumonia. Officers for the current year:—Pres., Dr. Pierce of Providence, vice-presidents; Peter Coutts of Cal., J. L. Gibb of Canada, J. F. Converse of N. Y., Alonzo Libby of Me., J. L. Turner of Texas; Sec. and Ed. of Ayrshire Herd Book, J. D. W. French of North Andover, Mass., re-elected; Treas., J. F. Brown of Providence, R. I.; Exec-Com. W. Birnee of Springfield, Mass., S. M. Wells of Westfield, Ct., C. H. Hays of Portsmouth N. H., J. F. Hyde of N. Y., Herbert Meriam of Weston, Mass....The officers of the lately striking Butchers' Union of Chicago have misappropriated $7,000 of the funds raised to support the strike—much wrangling as to which of them is the guiltiest....Jim Keene and his wheat combination are, it seems, in the meat business, too. While the prices of meat were highest in Chicago they unloaded a considerable quantity, and then during the recent heavy decline they bought in heavy quantities, and the rise which began on Monday last was due to their influence....There was a general snow storm in Cal on Monday—an application of a dressing of the poor man's manure....Last spring a bill allowing farmers to sell leaf tobacco of their own production to other persons than licensed dealers without paying special tax was referred to the Committee on Agriculture, of the National House of Representatives, which has just reported it favorably to the House. The manufacturers now insist that it should properly have been referred to the Com. on Ways and Means, and strenuously oppose the passage of the bill. It has a very strong support, however, among those who from policy or a principle of fairness, are beginning to pay attention to the agricultural interest....On Jan. 26th, a bill was introduced into the Lower House of Congress, By Mr. Mason of N. Y., to incorporate the Cosmo-American Colonization and General Emigration Bureau of the United States. The bill incorporates Thurlow Weed, Cardinal McCloskey, and twenty-eight others as such bureau, the capital stock of which shall be not less than $1,000,000 and may be increased, and the object of which is to be the encouraging, promoting and conducting of emigration from the overcrowded cities and other districts of the United States, and from Great Britain and other parts of Europe to the several States and Territories of the United States needing immigrants, and for other humane and commercial purposes....Owing to the disease of the vine, the area of the vineyards in France has decreased by about four hundred thousand acres since the year 1874; though a great portion of the soil in which the vine formerly flourished is unfit for any other culture. The area of vineyards in the country is at present about five million acres. ....John Bright advocates as relief for Irish troubles that Parliament should appoint a commission with full power to sell the farms of land, lords to tenants willing to buy them and advance three-fourths of the purchase money, the principal and interest to be paid in 50 years—the sale to be compulsory only where the land is owned by London companies or guilds, which is the case with large tracts here and there....."Fluke" on the liver is a very fatal disease among sheep near Banbury England....One of the boys on an English reformatory ship has died from trichinosis, although the pork had been thoroughly boiled for a long time—hitherto considered certain destruction to the parasites. Of course, it is noised abroad that American pork formed part of the dietary....The importation of pork from this country in any shape has been prohibited in Spain, Italy and Greece through alleged fear of a trichinosis epidemic....The largest shipment of grain that ever took place down the Mississippi started from St. Louis to N. O., week before last; 270,000 bushels of corn loaded on barges towed by a powerful steam tug....In 1879 nearly 22 million pounds of foreign wool were sold in Boston and 25 million pounds imported into N. Y., while woolen manufactures worth $20,773,785 were also landed here. Plenty sales for more home-grown wool....Salt is now being manufactured for fertilizing purposes exclusively—not classed, of a reddish tinge, price about $6 25 per ton, So says the Grange Bulletin....The National Grange is circulating a petition to Congress to amend the patent laws so as to make the manufacturer and vendor of patent articles alone responsible for infringement—success to that check upon patent swindlers and extortioners!....Several sales of land are reported near Gainsville, Ga., at 100 per cent. advance on last year's prices....The Ag. Dept. of Ga, estimates that 80 per cent. of the farmers who raise their own supplies make money, while 75 per cent of those who give liens and mortgages and pay high interest on supplies advanced, don't make both ends meet ... Mule market very lively in Ky., prices advanced $20 on good mules, but, like good Indians, they're scarce....The mule and horse trade in the South is said to be better than since '73....There's a small "boom" in broom corn culture about Danville, Ky....$5 per 112 pounds is the contract price for 300 acres of hemp to be raised this year in Fayette Co., Ky....20,000 bales of hemp "to arrive" have been lately sold here at 5c to 6¼c... Old hemp sells in interior Ky for $6 per 112 pounds; new, for $5; good seed very scarce and high-priced.... The convention of the butter-tub manufacturers of Vt., N. H. and N. Y., met at St. Albans, Vt., on Jan., 29 and advanced the price of tubs an average of one cent each... The Western Iron Association met last Friday at Pittsburgh and put up prices on iron....

For Women.

CONDUCTED BY RAY CLARK.

TO THE "RURAL" LADIES.

In the last issue you were informed of the departure of Miss Faith Ripley, by an announcement from her own pen. While entertaining personal regret that your relations have been severed, it is hoped that your interest in the "Woman's Department" will remain the same.

As her successor, I ask the continuance of your hearty co-operation in this particular work. The object is to make the department as interesting and instructive as possible. To do this your kindly aid will be needed now as in the past.

In soliciting articles it is left to your own judgment as to the selection of topics, but it is preferred that the matter be condensed as much as practicable. Mutual criticism thereby furthering the knowledge or thought of a particular subject—is requested. Prose is at all times of more value than poetry. Accept my best wishes to engender pleasant relations. Yours truly,

RAY CLARK.

HOME ECONOMIES.

I THINK the depth of woman's intellect is well proven in our "Club," even to masculine minds. Indeed, I began to fear that the current of their minds ran so very deep that we, who quaffed

FIG. 39.

nearer the surface, would find nothing to suit our needs. I fear, the silent way most of us accept and enjoy our part of the "RURAL" would not be justified. When we look for so much, ought not more of us contribute something to aid others in well-doing?

The many ways of making home beautiful without great expense, are duly appreciated by the busy energetic mothers, in farmers' homes, who love all beautiful pleasant things. They know how hard it is to procure the little luxurious comforts found in village homes. The longings to feast the eyes on art and beautiful surroundings, are no less strong, though unsuspected by their loving husbands toiling so faithfully to make home happy. How could they complain or add to their cares by wishing for pretty tasteful surroundings beyond their strength to supply and means to furnish.

The spirit of "Jessie Seabright" in "Log-Cabin Sketches" is needed everywhere among farmers' wives; a hungering for the beautiful and an indomitable energy that will surmount every obstacle to obtain it, even in a "log cabin."

A determination to make her home a comfortable abiding place for her husband and children and a talent to make the most of what one has at hand, are what one needs, as a farmer's wife especially. I have heard of one who threw into the rag-bag nearly enough to clothe a family. She was a farmer's wife who would have been glad of the extra money that would have been saved had she known how to make the best use of available material. The many hints of economical using of materials have been of such service to me that perhaps a few hints of mine may also benefit others.

A cloak was fixed nicely in this way:—The cloak was plain beaver, cut long sacque. We got three quarters of a yard of black velvet on the bias, two and one-half dozen buttons, one yard crinoline. In the house was a well-preserved black satin vest, out of date. We determined to sacrifice that for piping. The cloak was cut over, close-fitting back, and with velvet collar; cuffs, pockets and facings also of velvet, corded with the satin. The cloak looked very nice indeed. A slight expense made it very satisfactory to the owner.

Old Hats:—Did you ever find old hats a nuisance? Shall I tell you what to do with them? Old straw hats may as well be burned, though sometimes the brims may be sewed together for kettle mats, saving your table many a black mark. But wool or fur hats may be serviceable. A fine soft felt, binding worn rather rusty, and altogether shabby, was served this way:—Binding ripped off, thoroughly scrubbed with hot, clean suds; then a dye of extract of log-wood and blue vitriol took the rusty look away, and left it black as new. Some gros grain ribbon neatly stitched on for binding and band, and the hat was given a new lease of life, as best.

I found an old Scotch cap the other day. I plunged that into suds, then dyed it, and with a bit of silk vest-binding, a fore piece of new enameled leather, made the cap do nicely for a school cap for George. Now little mothers, economically inclined, try soap-suds and dye on old hats and rid the house of a nuisance.

Old waterproof cloaks were made over for our school girls' balmorals, by putting in black dye and pleating on ruffle of new waterproof with red flannel pinked, and trimmed with plain bias band above. One-half yard red flannel brightened two balmorals, and the girls are quite proud of them. As the cloaks were very rusty and outgrown, they were much more serviceable as balmorals, and will be durable. May these hints help some worker like myself. VINA.

THE TEACHER'S MANUAL OF DICTEE.

FOR a long time the natural desire to improve and extend education in the higher branches, had caused the beginning of school life and training to be neglected, but the tide of attention seems now to be turning the other way, and there is a notable tendency to put the best teachers and the best appliances into the primary schools. There, the best and most enduring impressions can be made; there, the young minds are like fair white paper,—blank; and even the muscles which must work together with electric readiness for the production of euphonious and intelligible speech are as yet neither warped by ill use, nor inert through disuse. The improvement of *elementary* instruction, of the primary grades of schools—is now the foremost care of the ablest friends of general education, not only with us, but in Great Britain, France, Belgium; and other countries. Entirely new modes are adopted: the first steps are made easy and pleasant, and in lieu of the book held before the little learner's eyes until it inflicts myopy and induces hatred of books and letters, the school room is made an interesting, happy place; the slate and the blackboard are chief means of gaining acquaintance with letters, and pleasant, natural reading is acquired without any of the bewildering trouble of spelling or tasking in any way with very little use of a book. A *desire* to learn is first infused, and then the child's literary education is as good as secured. The teacher is only a useful aid after that, and not an absolute necessity. There is no urging or driving to be done. If the art of Reading is well taught from the beginning, the faults that spoil its effect upon the hearer get no hold, and it soon becomes easy to the learner, and delightful to the listener. The arts of Spelling, and of Pencil-craft (Writing and Drawing) are less readily taught, and it is especially to this, although in great part to Voice-culture too, that the French method of Dictee applies. It is said to abbreviate the time and toil required for the mastery of English spelling very greatly, while it promotes art and precision in pencil-work, and secures full and complete enunciation and correct pronunciation. It is certainly founded on reason, and its method of exercise in spelling is that which we all eventually fall into—that of calling up in the mind the figure—the detail of letters—of any word that we have seen but once, perhaps, and copying them as we write. Children soon learn to recall these letters if there is some inducement to notice them, just as they recall items of dress or other objects that have arrested their attention, and there seems no reason why we should spend such a length of weary, disheartening time in vainly trying to teach spelling by the ear.

The manual in question gives entirely original definitions of vowel sounds, consonant sounds, and the classes of each. These are questions that lie at the very root of language, and will greatly interest every true teacher. The dictee uses a very simple but neat and linear shorthand to give, visually, the pronunciation of the words to be spelled, in order not to show the letters, which are to be recalled in the manner above alluded to. This secures a thorough drill in pronunciation and in the phonetic features of every word, but only the current mode of spelling is shown or taught.

FIG. 40.

FIG. 41.

A curious feature of the work is that it is printed from electric pen stencils. This is done in order to give illustrations in place with the lettered text.

W. G. W.

HAVE the courage to give occasionally that which you can ill afford to spare. Giving what you do not want nor value neither brings nor deserves thanks in return; who is grateful for a drink of water from another's overflowing well, however delicious the draught!

DESCRIPTION OF CUTS.

NOS. 40 AND 41.—BACK AND FRONT OF HOME-DRESS.—The dress is of dark violet cashmere; the skirt is trimmed with one deep kilting, and in front with twelve narrow kiltings; the tunic and jacket are deeply bound with Pekin, and trimmed with fringe. The back is shown in No. 40, and the front in No. 41.

No. 42.—HAT FOR LITTLE GIRLS.—Is of gray beaver, trimmed with ostrich-feather trimming and Sultan satin ribbon.

No. 39.—FAN.—This is a fashionable style of fan of feathers, mounted in mother-of-pearl. The feathers should match the color of the dress with which the fan is used.

CORRESPONDENTS' CORNER.

THIS is a question which may be out of your line but it is one which we have not been able to settle among ourselves, and would like to have your opinion on it, as editors know almost everything. A young man wishes to take a young lady to (say) Pinafore; she has sisters, both older and younger than herself. Should he also ask them, and if so, how far should this rule hold? Another of similar sort: Two young men are quite intimate and one of them gets married. His bride and young man number two, are not friendly, though acquainted, and he is not invited to the wedding. Is it his place to call on the couple after they get to housekeeping? CORRESPONDENT.

The first question we leave to some one better versed in etiquette than ourselves, merely suggesting that it is an open question, to be settled by the individual. To the second question we would reply that, if the young gentleman wishes to conform to the rules of society, he will not call. If invitations to the wedding were issued, and he a former friend, was ignored, it should be presumed that his company is not wished, unless a special invitation is afterward received from both parties.

WHERE can I get Lemon's Analine Dyes, and what do they cost? M. E. B.

ANS.—They can be procured at almost any grocer's or druggist's store. Price 25 cents a bottle.

WILL you please give a recipe for removing mildew? MRS. F. M. B.

Linn Co., Mo.

ANS.—Presuming the question to refer to mildewed clothing, we would say that there are several recipes, one of which is fresh buttermilk. Dip the article in the milk and expose it to the sun. We do not vouch for the efficacy of this or any other mode, however, as the removal is a very difficult process.

How shall I cut the girls' school dresses? Dark cotton plaid. Girls ten and twelve years of age; style of cuff and collar, also; and aprons suitable for school. M. A. A.

Canandaigua, N. Y.

In issues of earlier date will be found cuts and illustrations of dresses, aprons, etc., suitable for children; to these we refer the above questioner.

Literary Miscellany.

NEIGHBOR JONES.

I'm thinking, wife, of neighbor Jones, the man with the stalwart arm—
He lives in peace and plenty on a forty-acre farm.
When men are all around us with hearts and hands a-sore,
Who own two hundred acres, and still are wanting more.
He has a pretty little farm, a pretty little house:
He has a loving wife within, as quiet as a mouse;
His children play around the door, their father's heart to charm,
Looking just as neat and tidy as the tidy little farm.

FIG. 42.

No weeds are in the cornfield, no thistles in the oats;
The horses show good keeping by their fine and glossy coats;
The cows within the meadow, resting 'neath the beechen shade,
Learn all their gentle manners from a gentle milking maid.

Within the field on Saturday, he leaves no cradled grain
To be gathered on the morrow for fear of coming rain;
He lives in joy and gladness, and happy are his days;
He keeps the Sabbath holy; his children learn his ways.

He never had a lawsuit to take him to the town,
For the very simple reason there are no fences down;
The bar-room in the village for him has not a charm;
I can always find my neighbor on his forty-acre farm.

His acres are so few that he plows them very deep;
'Tis his own hands that turn the sod, 'tis his own hands that reap;
He has a place for everything, and everything in its place;
The sunshine smiles upon his fields, contentment on his face.

May we not learn a lesson, wife, from prudent neighbor Jones,
And not sigh for what we haven't got—give vent to sighs and groans?
The rich arn't always happy, nor free from life's alarms,
But blest be those who live content, though small may be their farms. [Atlanta Constitution.

WILFUL'S CHRISTMAS EVE.

CHAPTER I.

(Continued from page 78.)

"But you need not wake papa, nor stamp on my toes to emphasize your protest," expostulated Gertie. "Not even my stepmother, though she's a wonderful woman, can marry you against your will; and you have one, Lella."

"But she can mortify me, and humble me, and degrade me in my own eyes, and—"

"The gradient is one in twenty," broke in Mr. Lockwood, rousing himself with a yawn. "What did you ask me, Gertie? Bless my soul, how cold it is! How's the weather, my dears?"

"The wind has dropped, and the country is hidden by the snow that has fallen steadily for the last hour," answered his daughter, rubbing one of the windows to look out. "It will soon be quite dark."

"And there's no moon, and they keep the sorriest of horses at the inn from whence we shall have to drive to the Priory," said her father, dismally.

"Perhaps the General will send his own carriage for us," suggested his daughter.

"Not very likely. He values his horses too much to let them undertake such a journey after nightfall; eight miles each way, and the worst of roads; the valley that lies between the moors and his place will be almost impassable after such snowstorms."

"Then don't let us attempt it," said Lella. "Let us behave like sensible people, and go back to London."

"If Miss Darton had behaved sensibly and truthfully in the first place," cried an acrimonious voice from the opposite corner, "we should have been safely housed at the Priory before the snow commenced. It is hard, after years of incessant efforts to mould a character into rectitude, to discover deceit and trickery where one might reasonably have looked for something better."

"Don't Lella! what's the use?" whispered Gertie to her friend, as the latter would have commenced a passionate retort. Think of papa, if you won't have pity on me! It makes him so uncomfortable."

Lella thought Mr. Lockwood deserved all he had to endure for his spiritless submission to his wife's tyranny; but she loved his daughter, and for her sake closed her lips firmly, drew her veil over her hot cheeks, and sat in rather sullen silence, while

the train labored on through the snowdrifts and the deepening obscurity.

"Once or twice there was a temporary stoppage, and the speed was lessened more and more; but the occupants of that first-class carriage were either drowsy or absorbed in their own thoughts, and failed to notice these ominous signs of the difficulties with which the engine-driver was contending, till the train came to a standstill altogether.

"But this isn't —— Station: I can't see the lights!" exclaimed Mr. Lockwood, letting down a window, and attempting to look out. "Gracious me, what weather!" as the snow was driven in his face, nearly blinding him. "Guard!—I say, guard, where are we?"

"Four miles and a-half this side——, sir, and snowed up!" was the reply.

"But—but what are we going to do?"

"That's just what every one else is asking, sir, and I'm sure I can't answer them. This is about the wildest bit of country the line runs across; but there is a village some two miles off, where you'll maybe get shelter till the morning."

Mr. Lockwood drew in his head, and regarded his companions with such an air of dismay, that Lelia found it irresistible, and burst into a merry peal of laughter.

CHAPTER II.

UNDER WHAT SIGN?

As the discomfited Mrs. Lockwood refused to imitate the other passengers, who set off in a body to make the best of their way to the village of which the guard had spoken, she and her companions soon found themselves comparatively alone. At first she decided that the most dignified proceeding would be to remain where they were till one of the railway officials had procured a vehicle; but with some trouble they succeeded in convincing her that nothing of the kind was to be had; and the cold becoming more and more intense, she consented at last to make an effort to reach the village on foot.

But she had so sharply berated the guard, whom she persisted in considering to blame for what had happened, that he gave the necessary directions in the gruffest and curtest manner. The equally angry lady threatened to report him for incivility, and hurried Mr. Lockwood away, when he would have bespoken the services of the stoker as their guide. The consequence was, that after wading through the snow till they were nearly exhausted, and Baker, the maid, was in tears, the fact became evident that they had lost themselves.

"What's to be done now?" asked Mr. Lockwood, as they huddled together under a bank that sheltered them from the drifting snow. "I think we had better make our way back to the train."

"I can't do it," answered his lady, faintly. "You are cruel to propose it. I should perish in the attempt. You had better leave us here while you go in search of assistance."

But Gertie and Lelia clung to his arms, protesting that he should not run any such risks.

"It is his duty to do it," Mrs. Lockwood muttered selfishly.

"And it is ours to prevent it," Gertie took courage to retort. "We must and will keep together, let what may happen."

Here Baker burst into louder weeping, and wished she had never been prevailed upon to leave London.

"My good girl, pray be quiet!" implored Mr. Lockwood, almost beside himself with apprehension for the safety of the four helpless women dependent on his exertions for their rescue. "Lelia! Gertie, my darling! didn't the guard say something about a roadside-inn somewhere in this direction?"

"Yes, but mamma would not hear him out, and one cannot tell how far astray our wanderings have led us."

"I can see a light!" cried Lelia, suddenly, "and at no great distance. See where it shines out again, as if somebody had drawn back a curtain to look out at the night!"

"Thank Heaven!" ejaculated Mr. Lockwood, fervently. "It must be the inn of which we were speaking. Courage, girls; there's a chance of getting shelter at last. Wipe away your tears, Baker; you'll see London again, never fear. Now, wife of mine, it's *your* duty to make another effort; so come along, and let us all try and reach the house we have been lucky enough to find."

Mrs. Lockwood was too much exhausted to resent this sly thrust, and hung heavily upon his arm as he strode manfully on. Cheered by the steady glow of that bright lamp, everyone followed his example; but the difficulties of the route were tremendous; they soon found that they were traveling across country; that there were low stone walls to climb and drifts to wade through. Twice Baker, who was short and fat, sank into a hole, where she stuck fast, howling dismally, till Gertie and her father came to her assistance; and everyone was so exhausted, that even Lelia's bright orbs shone through tears of thankfulness, when they found themselves standing in front of a long, low, old-fashioned dwelling, that looked delightfully snug and pleasant to the weary party.

Mr. Lockwood's rap at the door brought to it a portly dame, whose cry of mingled astonishment and terror caused a door on one side of the passage to be thrown open, and Lelia fancied she caught a glimpse of a couple of masculine forms standing just within it.

But Mrs. Lockwood, whose spirits revived as soon as she knew she was safe, cut short the civil explanations of her spouse, by addressing the woman herself.

"Are you the landlady of this inn? Then let chambers be got ready for us directly. There must be good fires lit in them, and I shall require a hot bath, and some white-wine whey, and my bed carefully warmed; and pray don't keep us standing here, but show us where we can thaw our hands and feet, and take off our wet wraps."

The woman hesitated a moment, then ushered her unexpected guests into an exquisitely neat kitchen, where a huge wood-fire was burning on the hearth. Even Mrs. Lockwood was too glad to bask in its glow to be as fastidious as usual, and condescended to say it was very comfortable. Long after she had retired with Baker to the neat little room hastily set in order for her reception, Gertie and Lelia continued to sit with their feet on the hearthstone, drying their skirts, shaking the snow-crystals out of their tresses, and chatting merrily with their father, who pronounced himself too comfortable to stir from the huge old leathern arm-chair in which he was reclining.

"I wonder whether we shall be able to continue our journey to-morrow?" observed Gertie, as, in pity to their yawning hostess, they rose at last to follow her upstairs.

"I hope not," answered Lelia. "I hope we shall be snowed in by morning, and that there'll be no signs of a thaw till the larder begins to be empty."

"You foolish child, you'd soon find yourself moped to death in a country inn."

"Not I!" was the gay reply. "I'll find myself plenty to do, and when all other resources fail me, I'll sing all my old songs, and make Baker and her mistress warble choruses to them."

The notion was so absurd, that both girls went upstairs laughing over it; till Lelia, chancing to look back, saw that the door in the passage below had opened again, and as before, she caught a glimpse of masculine figures.

"I fancy we are not the only belated travelers staying here to-night," she observed to Gertie, who was, however, too well satisfied at the sight of a comfortable bed to discuss any subject but the relief of resting her aching limbs upon it.

Youth and their excellent constitutions enabled the young girls to shake off the ill effects of their fatigue and exposure. They slept long and soundly, and were already at their toilette, when Baker came in, red-eyed and dismal, to announce that her mistress was too ill to rise and firmly believed that she was going to have rheumatic fever.

Gertie dutifully proceeded to her chamber, and came back to confide to her friend that Mrs. Lockwood's indisposition seemed to proceed principally from the state of the weather. There was every prospect that Lelia's wish would be gratified, for the snow continued to fall so steadily that all the approaches to the cottage were blocked, and their hostess predicted that some days must elapse before they would be able to cross the wide expanse of moor that lay between her dwelling and the nearest town.

"Did you remind Mrs. Lockwood that it is our duty to be resigned to the inevitable?" asked Lelia, saucily, as they ran down stairs together.

"No; I behaved myself, which is more than you know how to do; was civil and sympathizing; promised to send up as dainty a breakfast as we can procure here, and to ask for the latest newspapers, and a mounted messenger to carry to the Priory a report of our position."

"I hope you'll not be able to get one," said Lelia. "I shall protest against any poor fellow risking his life for such a purpose. I'd rather spend my Christmas here a thousand times, than be compelled to be civil to my lord the Viscount."

"Now, for my part, I should dearly like to see him," Gertie declared; "but where are we to take our matin meal? Are we to go into the kitchen again? Oh! no, the cloth is spread here," and she stepped through the door Lelia had noticed on the previous night, and found herself in a low-ceiled, quaintly-furnished parlor. "Empty eggshells and crumbs of bread! Was papa too hungry to wait for us?"

"If so, he has not breakfasted alone," said her friend, pointing to the two empty cups on the table.

"Oh! please, miss, please 'm," said a shy, awkward handmaiden, who had followed them into the room, "missis is boiling some coffee and baking some cakes for you, and I'm come to clear off these things out of your way."

"Who has breakfasted here? Cannot we have the room to ourselves?" asked Lelia.

"Please, 'm, there ain't no other, only the kitchen, and it's the two gentlemen, Mr. Lee and the t'other one," the girl answered incoherently.

"I told you there were people here," said Lelia, "What a bore!"

"I wonder who they are?" mused Gertrude. "They call everyone *gentlemen* at these places. Perhaps they are commercial travelers."

"What they call bagmen in 'Pickwick,' I suppose," added Lelia, advancing towards the bay window. "I think I've seen them sometimes at Brighton — Jewess-looking fellows, who talk through their noses, and wear a quantity of jewelry. I hope they will have the good sense to confine themselves to the kitchen."

A smothered sound, very much like a laugh, at the other end of the apartment, made her turn sharply round, and stand transfixed and crimson with confusion; for two young men, who had been seated by the fire reading, had risen, and were bowing politely to the fair intruders.

Mr. Lockwood, who had been in the porch, surveying the weather, bustled in just then, and his genial manner relieved the embarrassment that had fallen upon the quartette.

"The Reverend Norman Lee," he read off the card the elder of the young men put into his hand. "Very happy to make your acquaintance. I was an Oxford man myself. And so you are doing a little quiet reading here"—he glanced at the Greek author open on the table—"with your—your brother?"

"Only by adoption," said the other, with a smile. "My name is Robert Sidney; and Lee, who is my old college friend and tutor, beguiled me here for less studious purposes than renewing our acquaintance with the classics. But this snow has spoiled our shooting, and made prisoners of us."

"Then come and be introduced to your fellow-captives—my daughter, Gertrude; my wife's ward, Miss Darton."

Mr. Lockwood was a little vexed that his cordiality to his new acquaintances was not seconded by Gertie or Lelia, who seemed to have lost all their customary ease of manner; but he endeavored to atone for it by his own civility, and would not listen to Mr. Lee's proposal that he and his friend should carry their books into the kitchen.

A PLEA FOR ONIONS.

I NOTICED in the RURAL an article from an English paper regarding *Onions*, and feel inclined to believe the fact of their *usefulness* as a medicine, in this wise—During the prevalence of epizootic in this country we had 400 bushels of onions—prices were very low, and when the disease came in the neighborhood, we commenced feeding the onions at the rate of a peck twice a day for each horse. The consequence was that in our case the epizootic was *very* slight—only old horses showing *any* symptoms, while all around us it was very bad. Of course, we gave the onions all the credit, not knowing any other difference of treatment.

Canada. ANNIE L. JACK.

A CHRISTMAS AFTER-THOUGHT.

MRS. ANNIE L. JACK.

Now the holidays are over, and we settle down to the regular routine of winter work, it is safe to ask one's-self if the "play's worth the candle," and if we are satisfied with the results in holiday making? Does Christmas mean to us but the interchange of gifts, given and received because such is the custom? Does it mean to the children simply Santa Claus and turkey, or are there deeper and nobler aims that influence our lives after the giving and receiving is over?

In "Every Day House" the living rooms are trimmed with ground pine, holly, and other evergreens; cards are brought out that speak of good wishes, and hung among the greenery.

The Christmas tree stands in the parlor until January is fairly on its way, and each child leaves part of its fruit to be distributed to some of the little ones of the neighborhood, who speak of *the* tree as if it were public property to enjoy. We like this. It adds to our pleasure that it is so, and we hope in this way to make the holidays *last* a little way into the year.

But I often think these days are, with too many of us, like a Sunday face that is put off with our best clothes when we go out to fight with the world.

How can we say a mean or slanderous word of the neighbor to whom we addressed the fervent "Happy New Year!" or think hard thoughts the next week of the friend to whom in the melting holiday mood we have sent a timely gift? Yet such is human nature; and it would be well for us all, if in our homes we could inculcate the charity for all men, that would lead us to make New Year wishes last "all the year round."

MARSH'S CYLINDER-BED FOOT LATHE.

THIS is the most perfect combined machine we have ever seen, and is made in the most finished and workmanlike manner. Its great merit lies in its capacity for doing so many different kinds of work. It is a machine shop, in itself, with tools, lathe, saws, (circular and scroll), and attachments. With this lathe a farmer is in a measure independent of the machinist; and the boys may acquire a familiarity with working in metals and wood, that will be of service to them in any station of life; and for those out of employment, the possession of this machine is a steady living. The Battle Creek Machinery Co., Battle Creek, Mich., will sell it for $32.50, and we give it away for a club of 95 subscribers.

PHILADELPHIA BROADCAST SEED-SOWER.

Broadcast Seed-Sowers are becoming popular. With a good machine of this kind the grain can be scattered much more evenly than it can possibly be done by hand. We do not mean to persuade farmers that they can no longer sow their grain by hand, but we do believe that a machine of this kind ought to be found on every farm, not only because it does excellent work, but also from an

economical point of view; a boy can sow as much and do the work as well as the most experienced hand-sower can, in the same time. The one here shown is made by Benson, Maule & Co., Philadelphia, Pa., and since its introduction has made a fine record. Its chief merits are an exceptionally large seed-reservoir, perfect, and wide-spread cast, and non-liability to get out of order. The range of its usefulness is note-worthy, it being capable of sowing the largest and smallest seeds. A gauge-plate, handily placed, makes the change instantly for different seeds, and quantities. The price is $6. We will supply it for a club of 12 subscribers.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE KITCHEN CLUB ON CHILDREN'S DRESS IN WINTER.

MRS. ANNIE L. JACK.

THE Kitchen Club met at Miss MacGregor's and were quite a cosy-looking company in her bright, cheerful kitchen. Some of the ladies had their work with them, and I remarked that nearly every one had a stocking and was busy knitting. Mrs. Demarce said, in answer to a question, that she had knit fourteen pairs of stockings during the month of December. She is a consumptive looking little woman and I was not surprised to hear Miss MacGregor remark that it had been asserted by physicians that knitting steadily was bad for the lungs. Of the truth of this assertion I am not prepared to vouch. Our grandmothers, who lived into the nineties, strong and vigorous, were often great knitters—but it may not be good exercise for people who are weak of lung or chest. For my own part I only confessed to a tiredness of fingers as my present experience. At tea we were favored with Miss MacGregor's specialty, which is a cookie that is always crisp. She does not pretend to have any special recipe, but makes them as follows: "Half pound butter. Half pound sugar, rubbed well together. Three eggs, beaten well, flour enough to make a stiff paste. Roll thin, cut with a round, notched cake cutter, prick with a sharp fork, and bake in rather a quick oven." "Haven't you left out something?" I said. "Yes," answered Miss MacGregor, quickly, "I generally have a little sour milk and put in a couple of tablespoonsful." We were to talk of children's clothing but I do not know that we made any wise or new remarks. The chief thing was conceded to be warmth, neatness and good taste. The fashion of dressing little girls to imitate their elders was condemned by all the ladies present, as was the costly and elaborate trimming so much in vogue. Mrs. Labarge suggested that the dresses of little girls be made longer in the skirt, and all the underwear be closer fitting, as giving added warmth. The kilted pants of boys coming just to the knee were universally condemned, and we congratulated each other that many people would not be led by the prevailing style. Mrs. Tompkins who has eight half-grown boys, wished there was some fashion by which their arms and legs would not always be too long for their clothes, at which we all laughed and consoled her with the remark that she had always one ready to step into the out-grown clothes, and that boys were so much easier dressed than girls. This she doubted if one took the mending into consideration. So with many pleasant remarks, some interchange of patterns, and a tea where harmony reigned and gossip was rigidly excluded, we bade each other a cordial good-bye.

PIG'S-FOOT OIL.

So long as Wager's grandmother was alive she always had me rub the little fellow's chest and the soles of his feet with pig's-foot oil, if at night he chanced to be hoarse from a slight cold—rubbing in the oil with a warm hand by the fire. How much good was effected by this I do not know, as one never can fortell with certainty what the result of an indisposition will be if let alone. But the application of the oil always seemed to act as a relief, and was sometimes applied again in the morning, if any trace of hoarseness remained. The oil or grease which rises on the top of pig's feet when being rendered into "souse," should be carefully removed, made free from sediment by straining, put into a wide-mouthed bottle not over a finger long, and duly labeled. It is then "handy" for the sort of use above mentioned.

M. W. F.

EVERY DAY MEALS, CANNING MILK, ETC.

Mrs. Annie L. Jack proposed that farmers' wives should send in an "*unembellished*" bill-of-fare for a day, and, as I hope to see others, I will give ours for a day in warm weather.

Breakfast: Boiled potatoes, the objectionable fried pork, *often*, well-cooked and crisped, but *not* "swimming in grease"; lettuce or something fresh from the garden; good, sweet *hop-yeast* bread (white and brown), butter, and a good cup of coffee. Dinner: Boiled rice and milk, *cold*, prepared while getting breakfast; bread and butter, and, in their season, some fresh vegetables from the garden; viz.: some green peas, string beans, green corn or anything we may wish. Supper: Bread and butter; fresh fruit; sponge cake and tea. Nothing elaborate, but wholesome and so easily prepared that many days I have no fire from morning till night, which is both comfortable and convenient for me.

Will Mrs. Annie L. Jack tell us something about those Muskoka ducks? We were much interested in her former account and would like to get some, if possible.

If those who are obliged to do without milk a part of the year will put new milk and cream, scalding hot, into glass cans and seal tightly, they will find that it will help in many ways. It is nice for mashed potatoes and many other vegetables. It can be canned during the last weeks of milking.

A square of cotton napkiuing, nicely hemmed and spread over a tin milk strainer, will take out fine hairs and tiny specks from milk.

Sewing machine oil stains may be easily removed by using plenty of soap with COLD water, and rubbing vigorously. I have erased them in this way for ten years. ANN B.

Nunda, N. Y.

EXTRACT FROM A PRIVATE NOTE—(Without Permission.)

PLEASE tell your Editor that in his list of qualifications of the RURAL, I think he makes too little of "our" department—not in space—but by ignoring your devoted work and its *value* to the paper. A large class of his readers are women, and they *influence* the men—ahem! in their choice of a paper. In speaking to farmers' wives of *any* magazine or paper, I notice their *first* question is—"Are there good household hints and fashions in it?" But he extols Governor so and so's valuable paper on Agri—or some other culture; Professor Somebody's on Pom—or some other ology—and lets your work, well, perhaps, stand on its *own* merits—and the *faithful* Woman's Department likewise. A. L. J.

HOUSEHOLD HELPS.

I WILL say to my house-keeping sisters, who know the labor of beating eggs for pound cake, that the cake will be just as nice if they are not beaten at all. If you will cream the butter and sugar together until smooth, then stir in first a handful of the flour, next two eggs, another handful of flour, two more eggs and so on until you have it all mixed; add the flavoring, stir a few minutes and it is ready for the oven.

I could not be induced to try the above recipe for some time after I heard of it, but since I have tried it I do not make cake any other way. I think if my sisters will try it they will like it as well as I do.

Lawns and calicoes should always be washed in cold water, if you wish to preserve their colors. Warm or hot water either will fade them. Never use the kind of soap that is put up in bars or papers, by certain dealers to whiten or make clothes clean without boiling. To wash calicoes, &c., with common turpentine, or country made soap will brighten the colors. All such goods should be ironed on the wrong side. I wish some of my sisters would give me a recipe for doing up mourning calicoes, to prevent the starch from showing white on them.

A plaster made of soft soap and gum camphor will scatter swellings, boils, &c., just as well, if not better, than iodine, and is sometimes easier to obtain, especially in the country. M. H. S.

HOUSE-CLEANING HINTS.

An Excellent Whitewash.

Whiting five pounds, skimmed milk two quarts, slaked lime two ounces, linseed oil one pint. Put the lime in a stone-ware vessel and pour the milk on it, till it looks like cream. Then crumble in the whiting and grind all together as you would paint, after which add oil. You must keep your mixture constantly stirred, as the oil rises to the surface. This whitewash looks beautiful and cannot be rubbed off with a cloth when dry.

Furniture Polish.

The following recipe for polishing furniture I have always found satisfactory. Take spirits of turpentine in the proportion of two ounces to one of linseed oil, apply with a rag, and polish with buckskin, and afterwards with the hand. This polish looks splendid on pianos or organs and gives them a newness not otherwise obtainable.

I wish some lady would give me a recipe for the best manner of preserving citron, either for preserves or otherwise; also how to cook "Kale" so as to make it tender and palatable.

Chloride of lime put on a saucer under a piano or in the back part of an organ, is a sure preventative against mice.

MRS. M. J. GALPIN.

To Paper Whitewashed Walls.

Make flour starch, as you would for starching calicoes, and apply it to the wall with a whitewash brush. Let it become dry, then when ready to put on the paper, again go over the wall with the starch, also the paper, and apply. Walls may be papered in this way, which have been whitewashed for years in succession.

Alum is one of the best additions to whitewash to prevent its rubbing off.

Smoky walls may be improved by adding plenty of indigo to the water before mixing in the lime and other ingredients. M. A. L.

News of the Week.

MISCELLANEOUS.

Monday, February 2, 1880.

At Haverstraw, N. Y., there has been serious trouble between the property owners and the Albany and Jersey City Railroad Company, about the occupation of some land, each party claiming that the other was tresspassing. A fight lately took place between the attorneys on the two sides, each backed by several hundred men. No blood shed, but the trouble is unsettled....There was a light fall of snow in San Francisco on the morning of the 26th ult....The Grant "boom" is not quite so boisterous at present as it has been for some time past, and some of the most sanguine prophets even predict his retirement from the field....Masonic emblems have recently been discovered in Egypt, which indicates that the fraternity dates back to the construction of the pyramids....In the Shepherd's Fold, a so-called charitable institution of this city, has recently been discovered a veritable wolf in the form of avarice. The institution was under the sole control of a Rev. Mr. Cowley and his wife. They took in little children whom they pretended to give the most tender care, receiving funds from the public and in many instances also from the parents or guardians of the children. It was found that the litte ones were starved, beaten and maltreated in every way by the Rev. Cowley. No servants were kept and the children had to do all the work including washing and scrubbing, cooking, nursing each other when sick, etc. The matter was finally brought before the court where the foul management was revealed....Messrs. G. Carlberg and L. C. Elson, editors of the New York Musical Trade Review, which has lately suspended publication, have been engaged on the editorial staff of the Boston Musical Herald....Joseph Gillespie, a murderer, was hanged in Alexander, N. C., on the 30th ultimo. He was an accomplice in the murder of W. G. Fowler, a merchant of Moorisville, N. C., in October, 1878. Fowler was a quiet, respected citizen and the murder excited great indignation....

The inter-oceanic canal across Central America, now being projected by M. de Lesseps, has aroused some patriotic sentiment at Washington. The Monroe doctrine, which is, in short, that it is not good policy for the United States to allow any foreign power to interfere in any way with affairs on the North American continent, has again been revived. Politicians of every shade are unanimous in maintaing that if any canal is built, it should be mainly with American capital, and under the protection and control of the United States government. According to advices of January 30th, the French government has officially disavowed any intention to set up a protectorate in this country, or in any way to make itself responsible for the plans of M. de Lesseps.

The Ute Indians continue a subject for discussion in Congress. Gov. Pitkin of Colorado has for the past few days been giving evidence before the committee on Indian affairs, relative to the outrages and subordination of the Indians in that State. . . MONTREAL, Quebec, Jan. 30.—Mr. Parnell's visit to this city has been postponed *sine die*, and it is asserted by a morning journal that owing to the strong public feeling against his visit here, he will not come at all.

BANGOR, Me., Jan. 27.—The Supreme Court unanimously decline to recognize the Fusionist body at Augusta, and declare that the House and Senate now holding sessions in the State House is the legal Legislature.

AUGUSTA, Me., Jan. 27.—The Fusionists are very much depressed. At the reception of the news from Court, Major Smith said he believed the controversy had now ended. He said that while the previous opinion of the judges was based on the Republican statement there was room for reasonable doubt, but in view of the fact that the court had decided against them on a Fusion statement, they could but gracefully submit. He had got through playing Governor, and should go home. Major Smith's views will be adopted by the better part of the Fusionists, who will take their seats in the Legislature. Henry Ingalls, a leading member of the Fusion House, says he is not prepared to give an opinion to-night, but has always been in favor of yielding to the Court.

NEW ORLEANS, La., Jan. 26.—The steamboat Charmer, with 2,100 bales of cotton, was burned fifteen miles above the mouth of the Red River. Eight lives were lost, viz.:—Two chamber-maids, two cooks, two cabin boys, one fireman, one deck hand. The boat and cargo was valued at $13,000, . . From Battle Creek, Mich., the following is reported: A few weeks ago Edward Bingham brought home two living boa constrictors from South America, which were placed in the High School Museum. Miss Kittie Rhodes, aged 10 years, the janitor's daughter, has obtained such control over them that they obey her commands of tone and gesture. She recently introduced and exhibited them at a public entertainment, putting them through a course of tricks taught by herself.

FOREIGN.

In Ireland the famine is increasing in severity, especially in Connaught and the west. Last week there were three deaths from starvation. The attention of the whole civilized world is attracted to the deplorable condition of the island. The British Government is starting public works to give the poor employment, charity is sending alms from all sides; but the distress is only thereby prevented from being more widely fatal. Meanwhile political agitators are using the desperation of a starving people to further their own ends....In England the prospect of an early dissolution of Parliament seems to be the chief topic of general interest, outside the agricultural distress at home, the famine in the sister isle and the menacing aspect of the Continent. The late brisk revival of trade all over the country, has helped Beaconsfield and the Conservatives. Yet Gladstone and the Liberals expect to be able to elect a majority to the next House of commons, and thus once more to get control of the Government and its vast patronage:...In France, also there is talk of the dissolution of the present Assembly, in which case the Imperialists will insist on an appeal to the people to decide the future form of government. Factions still bitter: Bonapartists, Orleanists, Legitmists or Bourbonists, united individually, but differing from each other in nearly everything but opposition to the Republic; while the adherents of the latter are divided broadly into three factions, united only in opposition to the monarchists. Quietly the army is being perfected, every able-bodied man in the country being liable to fill its ranks....In Germany Bismarck's recent increase of the army is the subject of most interest. This mighty machine will soon have every regiment and corps completely full—to be directed against whom? Either France or Russia it is pretty sure, or perhaps against both, in which case Austria according to the late agreement, would take a hand. Krupp's great gun foundry is so busy that 2000 fresh workmen have been taken on, yet the men work half the night. Steadily and rapidly all over the country quiet preparations are being made for war, or for such a display of might as shall gain all desired concessions from neighboring nations...., Austria is watching Italy where the "Unredeemed Italy" party are vigorously insisting on a war to "free" Trieste and the adjoining territory. Italy is just now proud of the completion of the most powerful iron-clad afloat; while famine oppresses 92,000 people in the Southern or old Neapolitan provinces. Great floods and much destruction of property just cablegrammed ....Spain is busy recuperating from the late inudation in the south. The attempted assassin of the King the other day, turns out to be insane. The emancipation of the Cuban slaves, though decided, still causes much bitter discussion as to the *modus operandi*, and details....Russia has her hands full suppressing the Nihilists by death and Siberia, restoring her *prestige* in the East, lately injured by her serious defeat by the Turcomans; keeping one watchful eye on the British in Afghanistan, and another on the German warlike preparations. There is talk of re-establishing the Kingdom of Poland, with an independent sovereign or with the Czar crowned especially in that connection, as the Emperor of Austria is crowned King of Hungary. This morning's cablegram announces a project for incresing the already enormous army by 150,000 men....The general aspect of Europe is anxious, vigilant, expectant and decidedly belligerent.

A CARD TO DAIRYMEN has been published by Milton B. Fraser, of Rome, N. Y., giving notice that on January the 21st he sold to Messrs. Whitman & Burrell, of Little Falls, N. Y., his entire business in cheese factory furnishing goods, apparatus, etc., together with his U. S. Letters Patent for gang cheese presses and hoops, and his goodwill in the business. The purchasers will continue the business in Rome for the present, and as they now own the right to the Sternbergh patents and are the licensees of Hubbell & Co., they can sell the Frazer presses and hoops, or any other, and give purchasers the right to use them, free from all claims from any parties whatsoever.

MESSRS. WALTER BAKER & CO., the celebrated Chocolate manufacturers, of Boston, have just entered upon the second century of their business career with the prestige which is won by long-continued success,—a success born of enterprise and perseverance, and achieved by unswerving business integrity and a desire to excel where others were satisfied with merely doing well. Prompt to perceive and quick to adopt every advantageous scientific discovery or mechanical invention that would tend to the perfection of their preparations of Cocoa, etc., they have now the satisfaction of knowing that their goods are "the standard for excellence and purity throughout the world," having received the first premium at all International Expositions. As the healthful, strengthening and medicinal properties of Cocoa preparations are rapidly becoming more widely known, the demands on the resources of Baker & Co. are correspondingly greater, so that we may safely predict that their success in their second century will be even greater than in the past.

EGGLESTON TRUSS CO. Chicago, Ill.—*Gents*:—A short time ago I met Mr. Carmichael, of Traverse City who has been wearing a Truss of your manufacture for some time with great satisfaction, the rupture being closed, I have no doubt, permanently. I have known Mr. Carmichael for some years and think his case a remarkable one. The rupture was one of the worst I have ever seen. I wish you would send me your catalogue and price list. I have a bad case of umbilical hernia in a child, which I am in hopes your apparatus may help. Also others. Yours, &c,

Sherman, Mich. DR. H. D. GRISWOLD.

Grocers and Storekeepers

pay 3 to 5 cents a pound for extra butter made with Gilt-Edge Butter Maker. It increases the production 6 to 10 per cent. Reduces labor of churning one-half. Gives a rich golden color the year round. Sold by druggists, grocers and general storekeepers. Send stamp for "Hints to Butter-Makers." Address, Butter Improvement Co., Buffalo, N. Y.

HO! FOR EUROPE.—All persons desirous of visiting Europe or the East economically, and at the same time under peculiarly favorable auspices, should read Dr. Tourjee's advertisement, and send for his 48-page prospectus for 1880.

COUGHS AND COLDS are often overlooked. A continuance for any length of time causes irritation of the Lungs or some chronic Throat Disease. "*Brown's Bronchial Troches*" are an effectual COUGH REMEDY.

My mother drove the paralysis and neuralgia all out of her system with Hop Bitters.—*Ed. Oswego Sun.*

The Markets.

SPECIALS FROM ALL CENTERS.

Until Saturday, Jan. 31.

Baltimore.—Since last report Southern red wheat is unchanged; amber from 2c. to 3c. lower; No. 2 Western red winter up 4c; corn 1c. higher, oats a shade higher; hay steady.

WHEAT.—Southern red at 1.37@$1.40; do. amber at 1 45@$1.45; No. Maryland at $1.47½; No. 2 Western winter red, spot and January at 1.43@$1 43½; Feb. at 1.43½@1.43¾; March 1.46@$1 46¼; April $1.47 1-2@$1.48; May $1.48¼. CORN.—Southern white at 59@61c.; do. yellow 57 1-2@58c., western mixed, spot, January, 57¼@57 1-2c.; February at 56 1-2@56¾c.; March and April at 54¼@54½c; May 54¾@54⅞c.; steamer, 54 1-2@55c. OATS steady; southern at 48c.; western white at 48c.; do. mixed at 47@48c.; Penn. at 49c RYE dull at 90@92c. HAY steady; prime to choice Penn. and Md. at $7@$18

Boston.—For a change cattle and wool reports take the place mostly of usual reports this week. Little or no change in prices of other products from those last quoted.

CORN quiet; sales of mixed and yellow at 61@63c. OATS steady, but in moderate demand; sales No. 1 and extra white at 51@53c.; No. 2 white at 49½c; No. 2 mixed and No. 3 white at 47@49c. RYE at 95c. SHORTS selling at $20@20.50; fine feed and middlings, $21@22. WOOL—The demand continues good; prices are very firm and well sustained, with a decided upward tendency; holders are very indifferent about selling large lots of desirable grades, as it is evident that such wools cannot be replaced except at higher prices; all grades and qualities are in demand. Sales of Ohio and Pennsylvania fleece, X and XX, at 50@52c.; No. 1 fleeces at 55@56c; Michigan, Wisconsin and other fleeces at 48@50c.; Michigan medium and No 1 at 53@55c. Combing and delaine fleeces firm and in fair demand at 50@57½c; fine medium unwashed wools are selling at 30@45c, the latter price for choice and medium. Pulled wools are quite firm, selling fairly at 45@60c., and choice supers at 60@62½c. In California wool nothing of consequence was done, prices of fall ranging at 20@40c.

BRIGHTON CATTLE MARKET—Prices of beef cattle ₩ 100 lbs., live-weight—Extra quality, $5.62½@6; first quality, $5.12½@5.50; second quality, $4.62½; third quality, $4 25@4.60; poorest grades of coarse oxen, bulls, &c., $3 25@4 12½. There has been a large supply of cattle brought in from the West during the past week, a large portion of which were bought expressly for the English markets, especially those of the best grades of beeves. Cattle cost higher at the West than they did the previous week, but the trade here except for shipping cattle, has not improved any over that of one week ago. Many of the best cattle which were brought up for shipment to London and and Liverpool cost from 6@6½c. per pound, live weight, but there were but few if any bought at that price by butchers to slaughter for the Boston markets. There was a fair supply of beef cattle among those from Maine. WORKING OXEN.—We quote sales of 1 pair four-year-olds, girth 7 ft., live weight, 3,000 lbs., at $135; 1 pair five-year olds, girth 6 ft., 9 inches at $125; 1 pair extra nice ones, live weight 3,200 lbs., girth 7 ft., 2 inches, at $160; 1 pair, girth 6 ft., 10 inches, live weight 2,900 lbs., at $135; 1 pair, girth 6 ft., 8 inches, live weight 2,700 lbs., at $110; 1 pair, girth 6 ft., 4 inches, live weight 2,600 lbs, at $85 1 pair, girth 6 ft. 2 inches., live weight, 2,200 lbs. at $85; 1 pair, girth 6 ft., 6 inches, live weight 2,600 lbs., at $110; 1 pair, girth 7 ft., live weight 3,000 lbs at $129. MILCH COWS.—Extra $45@70; ordinary $20@44; springers, $18@50; farrow cows, $13@27 per head. SHEEP AND LAMBS, were nearly all owned by butchers, and cost, landed at Brighton from 5 to 7c. per lb., live weight. SWINE the fat hogs were all owned by butchers, costing from 5¾@5½c. per lb. live weight.

Buffalo.—Little or nothing doing in grain; scarcely enough to make quotations; cattle somewhat higher; hogs from 5c. to 10c. higher.

FLOUR steady with a fair demand. WHEAT offering No. 1 hard Duluth at $1 30. CORN—Sales of four cars of No. 2 old Western at 48½c on track. RYE—In fair demand but nominally unchanged; sales, 6,000 bushels of Canada on private terms. Nothing doing in other grains. CATTLE—Sales of fair to good native shipping steers at $4 25@4.70; bulls at $3 00@3 20; mixed butchers' at $2 95@3 30. SHEEP AND LAMBS—Weak and lower; buyers holding off to obtain concessions; a few sales of fair to good Western sheep at $3 00@3 25; sellers holding choice at $3 50; 20 cars remain unsold HOGS—Demand fair and firm; best grades disposed of; good to choice Yorkers at $4 50@4 85; fair light at $4 70@4 75; heavy and medium at $4 80@4 90; coarse rough to common, at $3 10@4 25; pigs at $4 35@4 40.

Chicago.—Since last report No. 2 Chicago spring wheat has gone up again 3½c. and other grades proportionally; corn has fallen from ½c. to 1c.; oats 3-4c. lower; butter steady; cheese somewhat higher; potatoes and fruit steady; hogs 5c. lower; cattle lower.

CHICAGO.—Wheat unsettled; No. 2 red winter at $1.22; No. 2 Chicago spring at $1.18 1-2 cash; $1.18 3-4 February; $1.19 7-8 March; No. 4 do. at $1.04 1-2 rejected at 88c. CORN dull, at 46 3-4c. cash and February; 41 1-2 at 41 5-8c. May; rejected at 34 1-2c. OATS dull and a shade lower 32 3-4c. cash and February; 36½c. May. RYE steady and unchanged BARLEY at 78c. BUTTER. The demand continues light from all classes of buyers, and the feeling in the trade is one of weakness. Good to choice creameries 28 and 33c. per pound; fine to fancy dairies, nearly equal to creameries, 24 and 25c.; good to choice fresh-made dairies 19 and 21c.; fair to good dairies, in shipping lots, 16 and 18c.; common to medium qualities 13 and 15.; roll butter 15 and 17c. CHEESE.—Exporters were taking hold pretty freely of low grades. Prime full cream sells at 14 and 15c, the prices given being for round lots. Good to the cheddar creams at 13 and 14c. per pound, and slightly sharp goods at 12 1-4 and 12 1-2c., white goods to best flats were bringing 12 1-2 and 13c, and the ordinary to fair stock 10 and 12c. BEANS.—There is but a limited demand, the only sales being made are in a small way. Good to choice hand-picked Eastern mediums held at $1.40 and $2.50 per bushel, and navys at 5 and 10c. above this range. Western quotable at $1 15 and 25 for common to good, and stock that requires recleaning and picking over was nominal at 60c. and $1 per bushel. GREEN FRUIT—The market for apples remains very quiet. For poor stock peddlers are about the only buyers, and a good many consignments are keeping very badly. Common to only fair stock sells slowly at $2@2 50 ₩ bbl, and good to choice at $2 75@3. Car-lots sell at about the same prices that are asked in a small way. CRANBERRIES were in fair request and firmly held at $7 50@9 ₩ bbl., the outside figure for choice cultivated. HAY—Good grades of both prairie and timothy are in fair request on local and shipping account, and former prices were named. Current quotations for car-lots on track range as follows: No. 1 timothy $14@14 50 ₩ ton; No. 2 do. $13@$13 50; mixed timothy $11@12, upland prairie $11@11 50; No. 1 prairie $9@10; No. 2 do. $8@8 50. Small bales sell at 25@50c. ₩ ton more than large bales. Sales were: On Track: By Sample—1 car No. 2 timothy at $13; 1 car upland prairie (to arrive) at $11 50; 1 car choice No. 1 prairie at $10 50. Free on Board—1 car No. 1 timothy at $14 50. POTATOES—Common mixed and dirty-appearing lots

were dull. We quote peachblows at 50@55c. ₱ bush for good to choice, on track, and do. early rose at 44@48c, with other varieties and mixed cars slow at 35@40c. In a small way 5@10c. ₱ bush, higher figures are obtainable SWEET POTATOES—Quotations range at $4 50@5 @ bbl. for choice to fine Jerseys, and at $3 50@3 75 for good to the best Illinois kiln-dried stock. SEEDS—Good to choice medium clover at $4 75@5 per bush.; ordinary to choice timothy at $2 70@2 85; flax at $1 65@ $1 70, on a basis of pure, and good to choice Hungarian and millet at 85c.@$1. HOGS—mixed packing at $4 30@4 55; light at $4 35@4 55; choice heavy, $4 50@4 75. CATTLE—Market slow; shipping at $3 75@5 40; native butchers' active and firm at $3@4; stockers and feeders steady, but slow at $2 60@3 80. SHEEP—Market overstocked and weak; common ½@¾c. per ℔ lower at $3 70@ $5 70. WOOL—The asking rates from store for eastern Iowa, Wisconsin and Illinois wool range as follows: Tub-washed bright 56@60c. ₱ ℔: do. dingy and coarse 50@55c.; fleece washed medium 48@52c.; do. fine 45@48c.; do. coarse 45@47c.; unwashed medium 35@38c; do. coarse 33@35c., do. fine bright 28@31c.; do. heavy 24@28c.; bucks' fleece 20@22c. Consignments from western Iowa, Nebraska and Kansas sell at about 2c. @ ℔ less than this range, and burry and poor-conditioned lots at 3@5c less.

Cincinnati.—Since last report wheat, oats and corn are unchanged; rye and barley 2c. lower; choice Western Reservoir butter has fallen 1c. on lower kind, steady on best, choice Central Ohio from 2c. to 3c. lower.

WHEAT at $1.28. CORN weak at 43c. OATS quiet at 42c. RYE dull at 85c. BARLEY dull at 88c. Choice Western Reserve 23c.@25c.; choice Central Ohio at 17c.@20c. HOGS quiet; common at 3.50@$4.30; light at 4 35@$4.60; packing at 4.45@$4.65; butchers at 4 70@$4.80; receipts, 3,700; shipments, 1,200.

Detroit.—Since last report there has been a fall in futures in wheat, but everything with regard to cash sales is so unsettled that no satisfactory figures can be given this week; corn from 2c. to 4c. lower; oats 1-2c. lower; clover seed held at 35c. higher, but nothing doing at that price; dressed hogs steady.

WHEAT unsettled; extra white Michigan no sales; No. 1 white Michigan spot, no sales; February, $1 23¾; March, $1 23¾; April, 1 30¾; May, 32¾; milling No. 1 nominally $1 20. CORN dull, with not much inquiry; No. 1 yellow at 45c.; high mixed at 44¾c.; No. 1 mixed at 44c.; No. 2 do. at 43¾c. OATS firm and active; No. 1 white at 41@ 41½c.; No. 2 do. at 40c.; No. 1 mixed at 40@40¾c; No. 2 do. at 39c. CLOVER SEED dull; prime nominally at $4 65@4 70. DRESSED HOGS scarce at $5 15@$5 20.

Milwaukee.—Since last report No. 1 Milwaukee hard wheat has gone up 2½c.; do. soft, up 3c.; corn and oats ½c. lower; oat, rye steady; barley 1c. higher; live hogs about the same, except on higher grades 25c. lower; dressed, 10c. lower.

No. 1 Milwaukee hard at $1 20; do. soft at $1 19½; No. 2 Mil. spot, January and February, $1 18; March, $1 19¾; No. 3 do., $1 04¾; No. 4 do, 98¾c.; rejected, 90c. CORN—No. 2, 37½c. OATS 32½c. for No. 2. RYE quiet at 74c. for No. 7. BARLEY dull; No 2 spring at 70c. LIVE HOGS quiet at $4 25@ $4 50. DRESSED hogs dull and lower at $4 90.

Philadelphia.—Since last report, Western rejected wheat has gone up about 10c.; Penn. red 2 1-2c. to 3c.; other grades also up; corn steady; oats 1 1-2c. higher; butter steady; eggs 1c lower; cheese 1-2c higher; seed mostly unchanged; hay steady; rye straw 50c lower; other straws steady.

WHEAT—Western rejected at $1 37; Penn. red, on track, at $1 43; amber at $1 41; No. 2 red, in elevator, car lots, at $1 43. RYE—But little offering; Penn. 90c. CORN—Fair local consumptive demand, with some export inquiry, but not much disposition to operate in futures. Sail yellow, on track, at 58c; mixed Western at 57c; Western ungraded at 56@57c; rejected at 55c; Southern white on track and afloat, at 60 1-2c. OATS—No. 2 white sold at 49½c March; 48½c bid and 49 1-2c asked for No 2 white January; 48½c bid and 50c asked February; 48c bid and 48 1-2c asked March. BUTTER moving slowly; creamery extra at 32@34c.; Bradford county and New York extra at 25@26c; Western Reserve extra at 23@25c.; do. good to choice at 17@22c; rolls dull; Penn. extra at 14@16c.; Western Reserve extras at 17@19c. EGGS quiet; Penn. at 16c; Western at 15@16c. CHEESE strong; New York factory at 14 1-2@15c.; Western full cream at 14¼@14½c.; do. good at 13 1-2@14c.; do. half-skim at 13@14c. COFFEE—Dull and weak. SEEDS—Clover seed has been exceedingly dull, and the bulk of the offerings are again of poor quality, which is not wanted. Sales of 1,000 bushels Western and Pennsylvania, in lots, at 7@9¼c., as in quality—nothing but very choice high-colored Wisconsin or Ohio will command the latter price. Timothy seed is firm at $3 ₱ bushel. Flax-seed is scarce and in demand at $1,60. Cal. linseed sold at $2.53½. Orchard-grass commands $1.75. BEEVES—The market is moderately active and prices are steady; the heavy demand for export trade has made the wholesale rate high, and butchers are complaining that they cannot pay the price. We quote extra at 6@6¼c.; good at 5¾@5¾c.; medium, 5@5¼c.; common, 3¾@4¾c; bulls and cows, 2½@3¾c.; calves, 5½@6¼c. Sheep were in good demand. A choice lot sold for 6¾c., average weight 150 pounds. We quote extra, 100 to 130 pounds, 6@6¼c.; good, 90 to 100 pounds, 5¾@6c.; good, 80 to 90 pounds, 5¼@5¾c; fair, 70 to 80 pounds, 5¼@5½c.; common, 4¾@5c. LAMBS were scarce and in demand. Extra at 6¾@7c.; good, 6¼c.; medium, 6c.; common, 5¾c. HOGS, good at 6¾@7c.; medium, 6¾c.; common, 6@6¼c. FRESH COWS were moderately active and sales were reported from $20 to $50 ₱ head. HAY, prime is in steady demand at $19@20 for cut, and $18@19 for baled. STRAW is dull at $20@21 for rye, $12 for wheat and $13 for oat.

Toledo.—Since last report corn ½c. higher; clover seed 15c. lower. WHEAT dull; amber Michigan spot at $1 28; No. 2 red winter, February at $1 28¾; March at $1 31; April at $1 33¾; May, $1 36¾; No. 3 red Wabash, $1 13. CORN dull; high mixed at 41c. No. 2 spot at 40¾c.; February at 40¾c.; May at 44¾c. OATS nothing doing.

St Louis.—Since last report wheat has gone up 2¾c. on No. 2, red fall, steady on No. 3; corn 1¾c. lower; oats 1c. lower; hogs from 5c to 15c. lower; cattle steady.

WHEAT.—No 2 red fall at $1 22¾ cash; $1 21¾@ 1 22¾ February; $1 25¾@1 26 March; $1 28¾@ 1 28¾ April; $1 28¾@1 29¾ May; No. 3 do. at $1 17 bid. CORN 34¾@34¾c. cash; 34¾@35¾c. February; 34¾@36c. March; 37½@37½c. April; 38¾@ 38¾c. May. OATS lower at 36¾c. cash; 38¾c. May. HOGS, light shipping at $4 20@4 35; packing at $4 30@4 50; butchers' to select at $4 50@4 60. Cattle sales of native steers at $4 50@5; no prime or choice offered; butchers' steers of 1,100 lbs average were taken by the Canning Company at $4@ 4 25; feeders at $3 75@4 10; stockers at $2 75@3 50; cows and heifers, $2 40@3 25. SHEEP scarce and firm; light at $3 25@4; heavy at $4 25@5.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 31, 1880.

BEANS AND PEAS.—The bean market is firm, marrows showing best strength. Mediums quiet for local use the weather being unfavorable for consumption. W. kidneys salable at full figures. Pea and Red Kidneys dull. Sellers do not look for a break in prices while receipts run light. Green peas in few hands and firm at 1.80@$1,85; So. B. E. peas per 2 bu. bag, $2.25. Marrow beans, prime, $1.70@1.75, other, $1.55@1.65; medium, prime, $1.50@1.55; other 1.35@$1.40; pea, 1.50@$1.75; w. kidney, $1.60@1.80; red, do., $1.55@1.75; black, 1.75@$1.80.

Receipts of beans for week, 1,552 bush.; exports, 1,673 do. since Jan. 10, 12,100.

BEESWAX.—The movement is slack, but offerings are light and prices unchanged; quoted at 24¼@25¾c for Western and Southern.

DRIED FRUITS.—Apples have had more of a movement at inside prices, partly on export account Other descriptions are quiet and unchanged. Quotations for apples—New N.C., at 7@8¾c. for fair to good; 9@9¾c. for choice; 10@10¾c. for fancy sliced. Patent evaporated, apples, choice, in cases, at 13¾@14c.; do. good and prime, 12¾@13c.; N. Y. State sliced, new, 7¾ @8c.; do. quarters, 6¾@8c.; new southern quarters scarce and nominal; new North Carolina peeled peaches 17@18c., do., Georgia, 13¾@16¾c. Peaches—Delaware evaporated, peeled at 24@28c.; do. unpeeled at 13@15c.; new halves at 8@8½c., and quarters at 7@ 7¾c. Blackberries at 9¾c. bid for new. Raspberries at 25c. Pitted cherries at 18@19c.

Exports for week, 84 bbls. apples.

BUTTER.—Several weeks run of trade that has not run up in volume to the expectations of holders of State, have caused weakness to develop into decline. All grades of State are in buyers' favor and unless business improves with the help of a more favorable style of weather in Feb. and March, the shipper will have some pretty long lines to dictate upon. Many lines of State have been pretty thoroughly sorted over and customers begin to scatter, giving fresh Western, and for that matter, perfect oleomargarine the preference to off flavored State. Many dealers know how materially their fine ends have been broken off as they give regular quotations for offerings of dairy bodies. Western butter as a quantity is easier in sympathy with State, but still holds the brisk portion of business. Exporters are dealing fairly, paying 18@20c for Western, with a large offering of factory to be had at 16@17c. and State 21 @22c.; when they bid higher for the latter the stock is needed for local use. Rolls dull and turn out poorly in appearance this mild weather.

State pails and tubs, choice, small lots, 27@28c.; fair to prime, 22@26c.; winter made, 25@26c.; full dairies, choice, 25@26c.; fair to prime, 20@24c; firkin dairies, choice,; other bodies of dairies range at 18@25c.; poor State, 18@19c.; creamery, fancy, 34 @35c.; fair to good, 27@32c.; early-made, 21@26c.; Western imitation creamery, 22@24c.; dairy fresh, 24@25c.; other, 18@21c.; factory, finest, 21@23c.; other, 15@20c.; very poor Western 10¾@12¾c; rolls, 18@19c.

Receipts for week, 23,600 packages. Exports, 8,000 packages.

FRESH FRUITS.—Exports for week, 3,900 bbls.; since Jan. 1st, 32,100 do.; same period '79, 15,200 do. Russets mainly now go forward. The home market is quiet, and for line lots from store or boats, or for fresh receipts prices are easy. Some fancy, high-colored and extra-sized lots quoted in a small way, 50@75c, above.

Spitzenbergs, ₱ bbl., $3.50; Baldwins, choice, $2.75 @3; poor to fair, $1.75@2 50; Greenings, $2@2.75. Poor stock it well out, unless the weather of the past week has made a renewed supply. Cranberries firm for bbls, and tending higher for fine crates. Cape Cod, fancy, ₱ bbl., $3.50@4; other capes and Eastern, $6.50@8.25; N. J. crates, $2.25@2.62. Char. strawberries, 60c.@$1 ₱ quart. Catawba grapes dull at $2.50@ 3.50 ₱ case. Florida oranges are in better demand, with some odd lots of better quality. These specials bring $4@4.50, but the run of ht. bbls is quoted, $2.50 @3 50 Peanuts steady; receipts for Jan., 12,500 bags; nearly double, compared with Jan. '79. Hand-picked, Va., 5¾@6c. ₱ ℔.; extra prime to fancy, 4¾@5¼c.; good to prime, 4@4¾c. Hickory nuts not wanted; 50@75c. Pecans, 10c.

FURS AND SKINS.—We annex the late revision in prices consequent upon the higher market abroad. Beaver and Opossum at the London sale were more profitable for shippers than other fine skins. The catch of skunks has been large and prices are easy. Red fox is scarce. Bear, wolf and robe-style, skins are dull, as the demand here has been very light this mild winter. Cub bear as low as $2. Beaver, ₱ ℔, $1.75@2.50 N. & E.; $1@1.50 W. & S. W.

Bear, Northern Black, $7@10; S. & N., yearlings, $4 Beaver, N. & E. skin, $1@5; do., W. & S., 50c.@$3; Badger, 75c.@$1; Cat, Wild, 20@40c.; Fisher, N. & E., each, $7@9; do., S. & W., $3@4; Fox, Silver, as to beauty, $15@30; do., Cross, N. & E., $3@4; do., Red, N. & E., $1.00@1.75; do., S. Penn., N. J., and N. Ohio, $1.50@1.70; do., Red, S. & W., 50c.@$1; do., Gray, N. E. cased, 70@80c.; do., Gray, S. & W., 40@60c.; Fox, Kit, 30@50c.; Goat, American, ₱ ℔., 10@15c.; Lynx, each, $1@2; Marten, States, dark, $1.50@2.50; do., pale, $1@1.25; Mink, N. Y. & New England, $1@1.50; do., Canada, Michigan and Minnesota, 60@80c.; do., N. J. Penn. and Ohio, 60@70c.; do., Md., Va., Ky. Ind., Wis. and Iowa, 50@60c.; do., Missouri and S. Muskrat, N. & E., fall and winter, 10@13c.; do., do., West. Penn. and Ohio, fall and winter, 9@11c.; do., S., fall and winter, 8@10c. Otter, Ky., Va., N. C. Kansas, etc., $5@7; do., N. and E. and Northwestern, $3@8; do., Penn., N. J. Ohio and Western, $5@7; do., S. C. and Georgia, $4@6; Opossum Northern, cased, 10@30c.; do., Southern and open Northern, 5@12c.; Raccoon, Mich., N. Ind., N. Ohio, 65@80c.; do., Ill., Iowa, Wis. and Minn., 60@70c.; do., N. Y. and E. State and N. Penn., 50@55c.; do., N. J., S. Penn., Ind., Mo., Neb. and Kan., 30@50c.; Geo., Ark., Fla. and Ala., 25 @40c.; Skunks, prime black, No. 1, cased, $1@1.10; do., No. 1, open, 90c.@$1 do., half striped, 45@60c.; do., striped, 25@30c.; do., white, 10@15c.; Wolf skins; mountain, large, $1 50@2; do., prairie, prime, 50@60c., Fisher, $6@10.

CHEESE.—Prices have worked up still further this week, and closed strong on the moderate stocks and a steady call from shippers, who have taken this week 25,585 boxes.

Quotations are for Strictly fancy, 14¾@15c.; choice at 13¾@14¾c.; good to prime, at 13¾@14¾c; fair to good, at 12¾@13¾c.; half-skimmed at 11¾@12¾c. State farm dairy: Good to prime 13@14c.; fair to good at 12@12¾c. Wis. factory: Fine, 14¾@14¾c.; good to prime 13@14c. Ohio factory: Cheddar, fine, 14¾@14¾c.; do., fair to good, 12@13c.; flat, fine, 14@ 14¾c. flat, good to prime, 13¾@13¾c.; flat, fair to good, 12@13¾c.; half-skimmed, 11@12c. Pineapple, State, 13@14c. do. Eastern, 15@16c. Young America, 14@16c. Imitation English, 14@16c.

Receipts for week, 6,936 boxes.

Exports for week, 25 000 do.

Liverpool cable, 75s, an advance.

Steam to Liverpool continues low, 25s.

COTTON has been active and closed strong at for Jan. 12.97@12.99c; Feb. 12 98@13c.; March 13 24@13.25c; April, 13.46@13.47c.; May, 13.66@13.67c.; June, 13.82@ 13.84c.; July, 13.94@13.96c.; August, 14.04@14.06c.; September, 13.35@13.40c.; October, 12.53@12.56c.

Quotations for spot cotton are based on American standard of classification, and no cotton in store running in quality not more than half a grade above or below the grade quoted.

Strict good ordinary	11¾	Middling	12⅛

EGGS.—Receipts for the week, 5,950 bbls.; do. last week 3,800 do. The market has ruled very unsatisfactory. Buyers' wants are few, but when centered upon special fresh stock, sellers find the surplus of old, stale or foul eggs very oppressive. Even good fair marks have been neglected.

Near points, per doz., 15@20c.; State and Penn., 15¾@16¾c.; strictly fresh Western and Southern, 16c.; fair marks Western and Tennessee, 15@ 15½c.; inferior, including state Canadian, 13@14c.; State, limed, 11¾@12¾c.; Canadian, 11@12c.; Western, 10@ 12c.

ESSENTIAL OILS.—An insignificant stock of peppermint holds very firm prices. Peppermint, in tin, glass, Hotchkiss, $3.50. H. & P., $3.25. Spearmint, $2.25 Wintergreen, $2.50. Wormwood, $5. Tansy, $2.50. Sassafras, 55c.

FLOUR.—The market has tended lower and has been very dull.

Prices are $4.40@$5 25 for inferior to very choice superfine State; $5.25@5.50 for inferior to good extra do., odd lots and lines; $5.50@5.85 for good to very choice do.; $4 50@5.35 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $5.25@5.50 for inferior to good shipping extra do., and $5.50@ 5.85 for good to very choice shipping extra do.; inferior to about choice white wheat extras, $5.65@6.60; choice to very fancy do. $6,65@8.00, the latter an extreme; red and amber winter wheat, inferior to fancy trade and family, at $5.70@7.50; round hoop Ohio, $5.40@5.90; and trade and family brands of do. at $6.00@7.50; the latter rate for very choice; St. Louis at $5.65@6.60 for inferior to good extra; $6.50@8 00 for good to very fancy; Minnesota clear, very inferior to fancy, at $5.40@6.00; Minnesota "straight," very inferior to very choice, at $5.75@7.50 and patent inferior to fancy, at $6.50@8.50; unsound stock at from $3 00@5 25; city mill extra at $5.25@6.75 for ordinary to fancy for West Indies do. for England, $5.25@5.75 for poor to choice; do. trade and family extras, $6.75@7.75; do. for South America, $6.40@6.75; No. 2 at $3.75@4.60 for poor to very fancy.

BUCKWHEAT FLOUR is selling at $1 85@2.10.

CORN MEAL.—Sales at $2.75@$3.10 for yellow Western and $3.30@3 35 for Brandywine.

GRAIN.—Wheat has been feverish and unsettled, but closed weak at a decided decline. Latest sales are of No. 1 white at $1.40@1.42½; do., January, at $1.41@ 1.42; do., February, at $1.41@1.42½; do., March, at $1.44@1.45¼; do. May, option, at $1.44¼@1 44¾; No. 2 white, at $1.39@1.40; ungraded white at $1.38½; No. 2 red at 1.43@1.45¼; do January, at $1.43@ 1.44¼; do., February, at $1.44@1.45½; do., March, at $1.47@1.49½; do April option, at $1.48¾@1 50; do. May, at $1.50; No. 3 red at $1.37@1.38; ungraded red at $1.36@1.40; No. 3 spring, at $1.23@1.31; ungraded spring at $1.23@1.25. Rye at 91@95 for Western and State. Corn is fairly active and relatively strong. Latest sales are of old No. 2 at 61c. afloat; do. new, in lots, at 61@61½c.; do., January, at 62c. bid; do., February, at 60c.; do., March, at 58¾@ 59¾c.; do., May, at 54¾@54¾c.; New York steamer mixed at 61¾c.; do., January, at 61c.; ungraded mixed western at 60 3dic.; New York No. 3 at 60@ 60¾c.; round yellow, old, at 70c.; steamer yellow at 61½c. Oats are fairly active and irregular in price; latest sales are of No. 1 white, at 50c.; No. 2 white at 48½@49c.; do. February at 48¾c.; No. 3 white at 48c.; New York No. 1 at 48½c.; New York No. 2 at 48¼@ 48¾c.; New York No. 3 at 47¾@48c.; ungraded white western at 49@51½c.; ungraded mixed western at 47¾@49c.; white State at 51¾@53c.; mixed State at 48¾@49c.; No. 2 Chicago, at 48¼c.

HAY AND STRAW have a good demand and prices are strong. Shipping hay quoted at 75c.; retail lots at 80@85c. for medium, and 85@90c. for prime; clover at 65@70c Straw at 95c.@$1 for long rye; 65@70c. for short rye, and 55@60c. for oat.

Exports for week 2,020 bales; since January 1, 9,275 an increase of 6,450 compared with 1879 at this date.

HOPS.—There is a difference of opinion respecting the market, some parties reporting a very dull trade and sales difficult, except at lower prices than we quote, while others show sales at the figures. It would probably be difficult to move large lots at the figures. The quotations are for:

	Cents per ℔.
New York, fancy	38 @40
New York, new crop, good and choice	34 @37
New York, new crop, medium	31 @33
New York, new crop, low to fair	29 @30
Eastern, new crop	27 @35
Wisconsin, new crop	27 @35
Yearlings	7 @18
Olds, all growths	4 @10
Pacific Coast, new	30 @35
Pacific Coast, olds (nominal)	5 @10
Bavarians	45 @60

POULTRY AND GAME.—Dressed poultry shows no improvement; a little cold weather has been offset by warm and rainy days when holders had some surplus. Anything above current wants at this part of the season, is dangerous property. Ducks are in fair demand; they and some squab are favorably affected by the lightly supplied game market Capons have declined.

Turkeys, N. J., 12@13c.; State, Mich., Ohio and Penn., 11¾@12¾c.; other Western, 9¾@12c.; Philadelphia dry-picked, 12@13c.; do. chickens, 11¾@12¾c.; N. J. do. 10¾@11¾c.; State and Western, prime, 9@10¾c.; prime to fair, 7@8c.; Phila. fowls, dry-picked, 9@10c.; N. J. State 8@10c.; poor to prime other, @7c. Ducks, choice, 14@15c.; other, 10@13c. Geese, choice, 10@11c; N. J. and State, 9@ 1c.; Western, 8@9c. Squabs, white, ₱ doz., 3.75@4; dark, 2.25@2.50. Capon, large, ₱ ℔ 18@ 20c.; small and slips, 15@16c.

Cooped stock abundant in buyers favor. Fowls, 8@10c.; roosters, 6@6c. turkeys, extremely low 7@10c.; ducks, pr 55c.@$1; geese, choice, $1.87; other, $1.12@ @ 75; pigeons, 35@40c.

The closing prices for quail, $4.00; partridges, $1.12 @1.50; grouse, $1,12@1.25; rabbits 35c; hares, 35@40c., these items have no legitimate sale after this date. Wild pigeons, $1.37@1.75 for acorn fed and fine trapped. Canvas back ducks, $2.25@2.50; red head, $1@$1.25; Mallard, 75@80c. Black and Broadbill, 50@ 60c.; Teal, 40@50c.; common, 20@40c.

PROVISIONS—Hog products have less demand and closed weak, with mess pork quoted $12.90@12 95 for new mess for January; $12 90@12 95 for do for February; $13 for do. for March and $13.10@13.15 for do for April. Bacon at $7.30 for long clear and $7.40 for short clear. Beef Hams at $16.75@17. Beef at for extra mess at $11@12; plain mess, $10.50@11; packet, $11.50@12.50; tierced beef, city extra India mess, at $20@22.50, and Philadelphia do. at $—.

Lard—Western steam at $7 90 for new on the spot; $7.85@7.87½ for new for February; $7.87½@7.90 for March; $7.95 for April. Stearine at 7¾@8 for Western. Tallow at 6¾c. for prime.

SEEDS—Clover is stronger with a better demand; quoted 8@9 for prime to extra choice Western and 9¾@10¾ for State; Timothy at $2.90@3.

VEGETABLES.—The shade of advance in potatoes noted last week has been lost; local buyers have considerable railroad stock to draw from, and can do better than from store. The enlarged export is owing to a temporary demand for the West Indies. A few Bermuda have sold at $6@7. Sweet potatoes getting out of date; prices easy. Onions firm. Fla. string beans quoted $3@4 ₱ crate; do., green peas, $1@1.25 small crate Bermuda tomatoes, $1@1.25 ₱ box; do., beets, $3@3.25 ₱ crate.

Nova Scotia B. Rose, per bbl., $1.50@1.62; do. Prolific, d.-h., $1.37@1.62; do. Mercer, $1.25@1.50; Maine, Early Rose, d.-h., $1.75@1.87; State, d.-h., $1.50@$1.62; do. b. $1.37@1.50; State Peachblows, red, $1.75@1.87; do. white, $1.37@2.00; Snowflake, $1.37@1.62; State Peerless, $1.25@$1.50; N. J., do., 75c.@$1. Sweet potatoes, 3 00@$3.25. Norf. Spinach, per bbl, $1.50@1.75; kale, $1@1.25. Squash, marrow, $1@$1.25; do., Hubburd, $1.25@1.50 ₱ bbl.; cabbage, $3@7 per 100; onions, white, per bbl., $4.50@4.75; yellow, $3; red, $2.75@3; Chester, $4.50@$4.75; beets, $1@1.25; Russia turnips and carrots, 50@87c.; celery, per doz.

WOOL.—Has not been active, yet holders are quite firm at late prices. Latest sales are:

X, XX and above Ohio at 51@53½c.; X and XX State at 45½c.; X and XX Pennsylvania at 48c.; No. 1 Oregon at 43c; scoured California at 71@75c.; fall California and Lambs' at 19@37c.; fine spring Texas at 35 @36c.; fall do. at 26@35c.; Utah at 33@37½c.; domestic noils at 48@52c.; Montevideo at 33c.; mixed East India at 18@30c.; Bagdad at 30@33c.; Cape at 32½c.; Australian at 58c.; do. old clip at 45c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Jan. 31.

BEEVES.—Receipts for the week, 11,934 head; do. last week, 13,783 do. The market during the week has been marked with fluctuations, and at no time on or since Wednesday has it favored the seller. A car load of premium cattle, 1,561 lbs average, brought 11½c.; dressed 58 lbs. Exporters have operated quite liberally this week, and have helped to prevent a serious decline in upper class stock. Common to good steers sold at 7¾@9¾c., dress, 55@ 56 lbs.; prime, 9¾@10¾c.; selections, 10¾c. Quality generally good, and herein much of the falling off in price consists this week.

COWS AND CALVES.—Receipts have slightly moderated, but prices are no better. A better average quality was offered. Good State cows have sold at $35, $40 and $50 per head. No call for heavier receipts.

VEAL CALVES.—Market steady for live at good prices; dressed in good demand when choice. Live calves, N. J. and Buck's Co. choice, 8@8¾c.; State and other N. J., 6¾@7¾c. Mount Holly, 300 lbs., down to 200 lbs., 5@5¾c. Buttermilk, 4@5c; grass, 2¾@3¾c. Dressed, fair to choice, 8@10¾c.

SHEEP AND LAMBS.—Receipts for the week, 29,481 head; do. last week, 26,258 do.; do. market rather over-stocked and sellers were anxious to part with stock. Sheep ranged 5¾@6c. with extra wethers at 6¼c. Lambs, 5¾@7¾c.

SWINE.—Receipts for the week, 21,673 head; do last week, 31,039 do. An advance on 'change gave prices for live an upward push and prime Western corn fed were worth 5@$5.35 per 100 lbs at the close. Country pork light 6¾@7c.; dressed 6¾@6½c; heavy, 6c.; dressed 6¾@6¾c.; Western dressed are of no account; now in fact they will never again form much of a branch of trade as far east as this.

Reading for the Young.

THE INUNDATION.

In many homes, and particularly in those in which Uncle Mark has some niece or nephew belonging to the Horticultural Club, the scene here presented will have repeated itself so often as to be quite familiar. The little girl is a gardener and a lover of flowers. In her solicitude for their well being she is administering the remedy that so many little girls (and many big ones, too,) think a sure cure for any and all ailments of the plants —water And she is giving it a thorough soaking. The large watering-pot is evidently too heavy for her, for being unable to manage it, she pours a liberal shower on the cushioned chair, from which it flows like a little Niagara Falls, to the floor, where it threatens to form an inland lake in a small way. She could most likely have avoided this "inundation" if she had taken the rose off the watering-pot and poured the water out of the spout. It is to be hoped that her mamma will not scold her when she discovers the flood. She ought to take into consideration the good intentions of her little daughter, and how troublesome it is for her to use the large pot. To be sure she could have watered her vine much easier if she had let the pot stand on the floor. She would not then have to lift the pot so high and there would be no occasion to pour water on the chair; but she does not stop to think of this. Her only thought is to give her plant water, and water it gets in abundance. All little gardeners should study this picture that they may avoid similar inundations.

THE INUNDATION.—Fig. 43.

LETTERS FROM THE COUSINS.

The Bobolink.

A little girl sends this description of the much-loved Bobolink:

Uncle Mark.—The Bobolink, or Bobolincoln, as he was formerly called, generally comes to us about the middle of May and remains until the middle of June. His color is black or blue black, at first, but he don't keep this coat of feathers very long. He soon stops singing and changes his coat to a kind of greyish brown, which is not so pretty. His song is very pretty, and he seems to say "Robert Lincoln! Robert Lincoln!" In size he is about medium, being between the sparrow and robin. Although they fill our meadows and pastures in large numbers, they do not gather in large flocks, as do some other birds. By their graceful movements, strongly contrasted plumage and cheerful notes, they enliven our fields and seem to constantly challenge the admiration of the beholder. He soon leaves us and goes farther south—generally to Virginia and South Carolina—where he frequents the rice fields. In South Carolina he is called the reed bird. When he gets as far South as that he does not care for dress; all he cares for is to get enough to supply his table, so he is a sort of a gourmand.

St. Lawrence Co., N. Y. May I. Moreland.

Dear Uncle Mrk:—I have had a great desire to join your Horticultural Club but thought you had so many little nieces and nephews that all the corners would be filled; but I see by the Rural that you still take new members for your club. We have not taken the Rural very long but think it an excellent paper. I read the cousins' letters weekly and would like to become one of them. Our garden did not do so very well last season, it was so dry. I have some house plants, and they are doing very well, for I am so fond of flowers. I attend to them every day; mamma has some English Holly seed and planted some of them in a box and cared for them, but they failed to come up. She has some more seeds, and she would be very thankful if Uncle Mark would tell her how to treat them so as to insure their germination and growth. I have two little brothers, Oliver and Leonard, who would like to become members of your club. Each of them had a little patch of ground for a garden last season, which they attended to in their own way and they raised beans, peas, watermelons, popcorn and Hollyhocks, and with pink and blue Morning Glories, Gourds, Madeira Vine and five leaved Ivy. I take care of all our flowers this winter. I must close, but will write again soon. Yours, Minnie Chapel.

Cortland Co., N. Y.

Uncle Mark.—Will you please accept me as a new cousin? I am 12 years old next month. I have one sister, and two brothers. I wish much to join your Horticultural Club if not too late. I did not have a very large flower bed this summer, but mean to have one larger next summer. We had a children's wigwam this summer and last; as shown in one of the older Rurals, it was covered thoy did very well considering the season was so dry. They watered their plants several times, but did not give them enough to keep them growing well, so now they say they will do better next season if it should be a dry one; the weeds had not much chance, for their hoes was going on some part or other of the garden nearly every day. Papa is going to give each of them a larger patch this year; I hope they will do well and then perhaps Oliver will write and tell you how he succeeded, so please put our names down as members of your club. Your niece, Wild Rose.

Burlington, Kansas.

Dear Uncle Mark.—I have written to you and the cousins once before, but so long ago that I presume I have been forgotten. I saw my other letter in print, so I venture to write again. I very much enjoy reading the letters from the cousins, but am not so much of a gardener as most of them. I am quite fond of flowers, and enjoy working out of doors, in the garden or yard. I always raise flowers, but the chickens bother me a good deal by digging them up. I am quite a housekeeper, and like to work in the house much better than out of doors. I wonder if all the nieces know how to cook. Especially do I like to make cake. I have written quite enough, so I'll bid you adieu. From your loving niece, Zephyr.

Michigan.

MAGAZINES FOR FEBRUARY.

Appletons' Journal.—Contents: A Stroke of Diplomacy, from the French of Victor Cherbuliez; The Comedy Writers of the Restoration; Miracles, Prayer and Law, by J. Boyd Kinnear; Life in Brittany; The Seamy Side, by Walter Besant and James Rice. Chapters XXVII—XXIX; Teaching Grandmother—Grandmother's Teaching. by Alfred Austin; The Russian Gypsies, by Charles G. Leland; First Impressions of the New World, by the Duke of Argyll; Editor's Table: The World's Paradises—The Pulpit and the Stage—Trees in Cities.

The Russian Gypsies.—It is, I believe, seldom observed that the world is so far from having quitted the romantic or sentimental for the purely scientific that, even in science itself, whatever is best set forth, owes half its charm to something delicately and distantly reflected from the forbidden land of fancy. The greatest reasoners and writers on the driest topics are still "genial," because no man ever yet had true genius who did not feel the inspiration of poetry, or mystery, or at least of the unusual. We are not rid of the marvelous or curious, and, if we have not yet a science of curiosities, it is apparently because it lies for the present distributed about among the other sciences, just as in small museums illuminated manuscripts are to be found in happy family union with stuffed birds or minerals, and with watches and snuff-boxes, once the property of their late majesties the Georges. Until such a science is formed, the new one of ethnology may appropriately serve for it, since it of all presents most attraction to him who is politely called the general reader, but who should in truth be called the man who reads the most for mere amusement. For Ethnology deals with such delightful material as primeval dumbo-cephalic skulls, and appears to her votaries arrayed, not in silk attire, but in strange fragments of leather from ancient Irish graves, or in cloth from lacustrine villages. She glitters with the quaint jewelry of the first Italian race, whose ghosts, if they wail over the "find," "speak in a language man knows no more." She charms us with etchings or scratchings of mammoths on mammoth-bone, and invites us to explore mysterious caves, to picnic among megalithic monuments, and speculate on pictured Scottish stones. In short, she engages man to investigate his ancestry, a pursuit which presents charms even to the illiterate, and asks us to find out facts concerning works of art which have interested everybody in every age.

Ad interim, before the science of curiosities is segregated from that of ethnology, I may observe that one of the marvels in the latter is that, among all the subdivisions of the human race, there are only two which have been, apparently from their beginning, set apart, marked and cosmopolite, ever living among others and yet reserved unto themselves. These are the Jew and the Gypsy. From time whereof history hath naught to the contrary, the Jew was, as he himself holds in simple faith, the first man. Red Earth, Adam, was a Jew, and the old claim to be the chosen people has been apparently confirmed by the extraordinary genius and influence of the race, and by their boundless wanderings. Go where we may, we find the Jew—has any other wandered so far?

Yes, one. For wherever Jew has gone, there, too, is the Gypsy. The Jew may be more ancient, but even the authentic origin of the Romnany is lost in ancient Aryan record, and, strictly speaking, his is a prehistoric caste. Among the hundred and fifty wandering tribes of India and Persia, some of them Turanian, some Aryan, and others mixed, it is of course impossible to identify the exact origin of the European gypsy. One thing we know, that from the tenth to the twelfth century, and probably much later on, India threw out from her northern half a vast multitude of very troublesome indwellers. What with Buddhist, Brahman, and Mohammedan wars—invaders outlawing invaded—the number of out-*castes* became alarmingly great. To these the Jats, who, according to Captain Burton, constituted the main stock of our gypsies, contributed perhaps half their entire nation. Excommunication among the Indian professors of transcendental benevolence meant social death and inconceivable cruelty. Now there are many historical indications that these outcasts, before leaving India became gypsies, which was the most natural thing in a country where such classes had already existed in very great numbers from early times.—*Appletons' for February.*

Eclectic Magazine.—Contents: Lord Beaconsfield. I. Why We Follow Him, By a Tory. II. Why We Disbelieve In Him, by a Whig: First Impressions of the New World, by the Duke of Argyll; The Letters of Charles Dickens, by William Minto: History and Politics, by Prof. Seeley; Early English Ballads; A Gossip about Goethe, in his Birthplace; Teaching Grandmother—Grandmother's Teaching, by Alfred Austin; White Wings; A Yachting Romance, by William Black. Chaps. XVII. to XIX; The Literary Calling and Its Future, by James Payn; Escape from Pain; The History of a Discovery, by Sir James Paget; A Sonnet in Dialogue. To E. W. G., by Austin Dobson; Mademoiselle de Mersac. Chaps. XXVIII and XXIX; Carlyle's Political Doctrines, by William L. Courtney; Sunshine and Shadow; Prof. Asa Gray. With Portrait, by the Editor; Literary Notices.

The Electric Light in the British Museum.—The practical utility of electric lighting was fairly tested on Saturday morning during the heavy fog which shrouded the metropolis. For more than a century readers at the British Museum have been compelled to suspend work on the occasion of a fog, and to leave the reading-room; but on Saturday morning shortly after ten o'clock, when many readers, unmindful of the improvements of the age, were about to quit with their papers, the electric light was turned on, and, without any apparent preparation, the spacious room was suddenly illumined as by a magic ray of sunshine, to the great satisfaction of all present. There was a murmur of applause. For with the new carbon which Messrs. Siemens have manufactured at their Berlin works, and with the gilt reflectors suggested by Mr. Bond, the principal librarian, the light is about as good a substitute for sunlight as can yet be devised. Since the latter part of October the electric light has been continuously used in the national reading-room of an evening until seven o'clock, and an average of more than two hundred students and literary men have been able nightly to proceed with their researches to that hour, instead of leaving off, as formerly, when the shades of evening fell. It is reported that one of the staff, Mr. Nichols, has worked closely for two hours for a fortnight by the light, with a view to try the effect on the sight, and finds that there is not only no inconvenience, but that the optic nerve is strengthened, and that glasses are quite unnecessary as a protection.—*Eclectic Magazine for Feb.*

PERSONAL ITEMS.

Gen. Grant has sent two trotting stallions, bay descendants of "Ethan Allen," as a present to the Mikado of Japan.

Jennie Flood, whom U. S. Grant is to marry, has just had $2,500,000 in registered 4 per cents given her as a wedding dowery by her father, the San Francisco nabob.

Young Ulysses Grant, "Buck," as he is generally called, has had a rich streak of luck. He has been speculating in stocks in New York, and is credited with having cleared $100,000.

Senator Lamar is very eccentric in his habits. Sometimes he will almost starve himself and then eat voraciously. He has fits of melancholy that last a long time. He is never very buoyant. His ordinary demeanor is that of grave and stern decorum.

The widow of President Tyler, in her petition to Congress for a pension, says that her means of support were swept away by the late depression of real estate, and she continues, "In fact I find I have scarcely anything whatever left to live upon and it is only in this extremity that I appear before you."

The Solid South to woman, are for Hop Bitters, using them as their only family medicine.

New Publications.

Emerson's Anthem Book.

By L. O. EMERSON. Price $1.25, or $12.00 per doz.

It is a pleasure to look through this fine book, and Choir Leaders will all be pleased with the general beauty of the music, and the great variety. There are more than 90 Anthems, Motets, Sentences, etc., including an Anthem Doxology and some fine new Hymn Anthems. Also 18 Responses and Chants. Music for Christmas, Easter, and all other special occasions is provided.

THE SLEEPING QUEEN, (30c.). Fine Operetta by Bailey.

HAVE YOU SEEN
"WHITE ROBES,"
the new Sabbath School Book? It is a grand good Book and is meeting with unexampled success.
Only published two months ago, it "takes" so well that the publishers are forced to issue edition after edition to keep pace with the demand. To state it tersely,

WHITE ROBES

has gone straight into the hearts of all lovers of Sabbath School Music, and the fact is due to its purity, freshness and originality.
Send 30 cts. in stamps for a sample copy. $3 per doz.

Temperance Jewels (35 cts.), by J. H. TENNY, should be used by all Temperance and Reform clubs.
Any Book mailed post free for retail price.

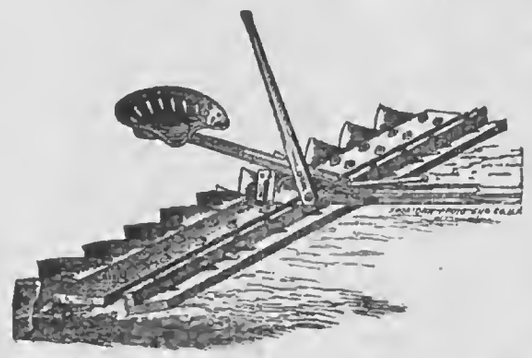
Implements and Machinery.

"ACME"
Pulverizing Harrow,
Clod Crusher and Leveler.



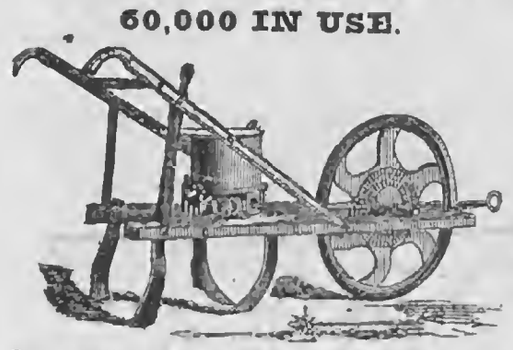
Has twelve steel coulter teeth and ten steel cutting spurs. Cuts over six feet wide, and two to four inches deep. The only implement combining Pulverizer Crusher and Leveler performs all three operations at one time in the most perfect manner. Works perfectly on light soil, but is *especially adapted to sod and hard clay where other Harrows fail.* Agents wanted. Send for circular. NASH & BRO.,
Harrisburg, Penn., and 22 College Place, New York.

Sawing off a Log,
Easy and Fast.

Our latest improved sawing machine cuts off a 2-foot log in 2 minutes. A **$100 PRESENT** will be given to two men who can saw as much in the old way, as one man can with this machine. Circulars sent free. W. GILES, 741 W. Lake St., Chicago, Ill.

A. H. Frank, Buffalo, N. Y., owns and controls Eastern and Middle States.
CAUTION.—Any sawing machine having a seat for the operator, or treadles for his feet, is an infringement on our patents, and we are prosecuting all infringers. SO BEWARE WHO YOU BUY OF.

HOOSIER CORN DRILL!
60,000 IN USE.



Drops, with great regularity, one grain in a place, either 12, 16 or 20 inches apart, does the covering uniform in depth, and is both time and labor saving. A given area of corn planted with this machine contains as many plants as when hilled, but their arrangement is such that *each* plant has access to the *same* amount of plant-food that must necessarily be *divided* between from 3 to 5 plants when huddled together in a *hill.* Hence a healthy start and vigorous growth of the plants and the consequent production of large, well matured ears, by which the quality is improved, and the yield increased from 10 to 20 bushels per acre, over hill planting are natural results following the use of our Corn Drill. Send for circular.
HOOSIER DRILL CO., Richmond, Ind.

MATTHEWS' SEED DRILL
The Standard of America.

Admitted by leading Seedsmen and Market Gardners everywhere to be the most perfect and reliable Drill in use. Send for Circular. Manufactured only by

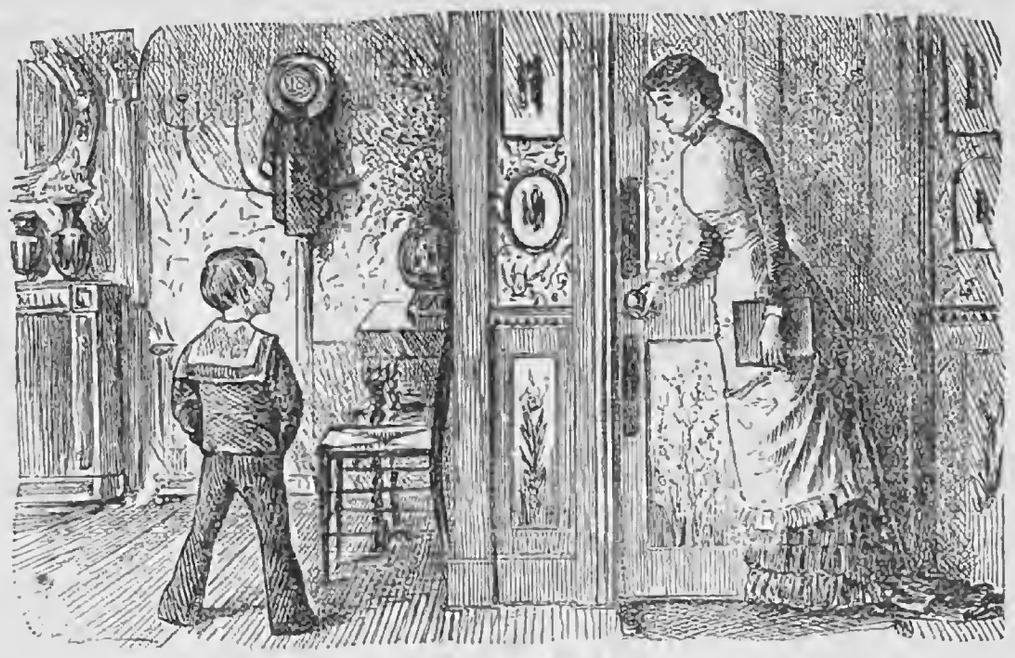
BRIEFLETS.

We can no longer supply back numbers of the RURAL NEW-YORKER. All subscriptions will be extended one year from the date of their receipt. . . The White Hydrangea "Thomas Hogg" is truly a valuable acquisition. It is nearly hardy and will stand the average winter of this climate with proper protection. A small plant purchased of a nurseryman last spring, bloomed with us through the entire summer and fall until frost. . . Of all the hardy, tall-growing grasses, we are still of the opinion that the Zebra-striped Eulalia is the most desirable. . . We have yet to find that the Cuthbert Raspberry has made one enemy. Its weak point is not yet discovered. . . With the Berkshire hog for stock and chufas for fattening, the South can be made the cheapest bacon-producing region in the world. . . Prophetic people are proverbial nuisances. . . Said General Jackson once: "I never place any reliance on a man who is always boasting about what he'd have done if he'd been there. You may depend upon it such a fellow never gets there." . . Mr. Nelson Ritter tells us that farmers should discuss the methods of marketing produce. He would rather raise an acre of strawberries than sell them. Nine-tenths of the people have no taste; they buy by the eye a red apple, yellow butter or a big pear without any regard to quality. . . It was once sneeringly said to Abraham Lincoln by a third-rate lawyer, "You used to drive swine to market when a boy." "Yes," said the President of this great Republic, "and *you* studied law, and it was soon found out that you and I had both mistaken our callings. . . Timidity in concession is for poor souls, who, if they concede much, may have little or nothing left. . . Do I, by coloring the butter, defraud my neigbor? Do I empty his purse? Do I give him an inferior article? No. Do I please his taste? Do I please his eye? I do. Where then is the immorality?—Report in Rural Home. . . There is a likelihood that the Mass. Ag. College will be consolidated with Amherst Barkis has not said whether he was willin' or not. . . When first offered, we tested the American Wonder Pea, introduced by Mr. Bliss, and reported upon it favorably. It is now offered by seedsmen in general, a proof that our report was not astray. . . Are "Egyptian Sweet" and "Washington Market" the same variety of sweet corn? If so or not, they resemble each other closely and both are first-rate sorts, though late. . . Peter Henderson says that Beauty of Hebron is one of the most valuable potatoes of recent introduction. . . How many distinct varieties of Asparagus are there that catalogues should tell us that the Colossal (Conover's) is the best? . . Probably Early Jersey Wakefield is one of the best varieties of early cabbage grown. . . We feel like thanking the Western Stock Journal and Farmer for its support of our views against horse-racing at agricultural fairs. . . It is often said that farmers have no time to attend to the garden. Why not give the garden time as well as the field? It will pay as well and oftentimes better. . . Mr. Hardin asks, in the Ag. Gazette of London: "Milk, pale, innocent, life-giving milk, what is there about it that should rob every dealer of his ordinary sense of human responsibility?" We would reply that there is nothing *in the milk*. . . Our readers, in ordering pears for spring setting, should not forget, among winter kinds, the Winter Nelis (one of the best—tree free from blight); Beurré d'Anjou (early winter), Dana's Hovey, Lawrence, Josephine de Malines and Beurré Gris d'Hiver. We respectfully urge it upon our readers not to order fruit trees of unknown traveling agents. Send for the catalogues of those whose announcements appear in our advertising columns, compare them and order accordingly. . . It is time to set hot-beds and to prepare for cold-frames. (For detailed instructions, see the catalogues offered in our advertising columns). . . Increase the value of your time by providing all tools and implements that will be needed for spring work—Whitewash the cellar—Select seed potatoes—Clean up the barn, the carriage-house, the granary, remove every old barrel, box and all rubbish; sweep away the dirt and the insects that winter in corners—Collect all rubbish from every source and burn it, saving the ashes for early vegetables—Repair fences, paint out-buildings, white-wash the henneries—Plow, if the ground is dry enough to crumble—Prepare for early planting of potatoes and especially for the early sowing of spring wheat—Sow clover seed—Keep pig-pens warm, dry and clean; filth, wet pens and little change of food are, no doubt, fruitful causes of disease—Study catalogues and determine what seeds and plants will be needed, and order them early—The present warm spell is favorable for pruning. Attend to the currant bushes—Cut out all old and scraggly stems and those which run crosswise—Get things in order—Hire the best help—Lay out your plans for the busy season. . . It may be a little early, but we like to be prompt when it helps trade. There is every prospect of a short peach crop this year.—Boston Post. . . We know a worthy citizen who is so upright that even the hair of his Sunday wig stands on end.—N. Y. News. . . An idiot in America is proposing to allow the original growers of new varieties of plants to patent them.—Mark Lane Express. . . The Germantown Telegraph answers the question "How to rid our premises of rats" thus: Cats, eats—nothing but *cats!* . . The dairyman who does not feed his cows well through the winter, is not only unmindful of the comfort of his cows, but is cheating himself out of the profits of the next season. . . Says Pres. Clark (Rural Home): "Unlike the farmers of the Old World, the American farmer is a sovereign, a power in the nation, the owner of the soil he works. His social and political status is inferior to that of no other class of citizens. How this fact exalts and ennobles the occupation of the farmer!" . . We should like to hear more from our readers with regard to their poultry experience. Many a valuable hint or bit of useful practice may be written in a few lines, and it is just such short *practical* items we most prize . . First-rate Lady apples sold during the holidays as high as $18.00 per bbl.



A PROTECTOR.

Tommy (on a visit to his grandmamma in the country).—"No fear of tramps now, Aunt Mary, with a man's hat and coat hanging in the hall!"

A Ruinous Loss.

A loss of bodily tissue, greatly in excess of the natural daily waste which takes place in the healthiest physical and mental structure, and but for which waste life and youth might be indefinitely prolonged, is entailed upon those whose vital powers are weak, and nervous system fragile. To arrest this ruinous loss and brace the system, a course of Hostetter's Stomach Bitters is the proper agent. Tone to the nerves, vigor and regularity to the digestive organs and liver are among the boons conferred upon the debilitated and sick of both sexes by this inestimable medicine, which more than any known tonic tends to check the progress of unnatural and premature decay. Sleep, renewed relish for food, are both obtained by the nervous and dyspeptic through its use, which is also the means of inuring the system to encounter safely malarious atmospheric influences.

Biographical.

OUR PORTRAIT GALLERY.

LEVI STOCKBRIDGE.

In every calling there are some men the simple record of whose lives is at once a lesson and encouragement to their co-workers. To farmers of the country a man of this sort is briefly presented in the following sketch.

Levi Stockbridge was born at Hadley, Massachusetts, in 1820, and continued to live there on the ancestral farm with his father until the latter's death in 1860. His was a busy life, however, though a home-staying one. When old enough he attended the common school of the town in winter and worked hard on the farm all the summer long. From his seventeenth to his twenty-first year his summer labors were as unremitting as before, but he had outgrown the common school, and attended the academy either at Hadley or Amherst, in winter. Here among more useful studies, he wasted considerable time on Latin and Greek. Like hundreds of other bright, young men raised on the farm, his ambition at this time looked to another career, and fired him with the desire to go to college and become a lawyer. This project, however, his father would not listen to, and the ardent youth was told he might have a good education, but that he must stay at home, carry on the farm, and in due time inherit it. Bitterly disappointed, he submitted to the paternal wishes, but vowed that even if he never entered college walls, he would have a college education, and to acquire this, after toiling in the field all day, he sat up in his room half the night foolishly poring over Latin and Greek books, but in other ways wisely preparing so that if any chance turned up, he would be fitted to hie away at once to college.

No chance, however, did turn up, and the conviction in time forced itself upon him that such a course of study as that he was then engaged in, would be of little advantage in the career before him, and that as he must stick to the farm, it would be far wiser to learn something more about farming than his father could teach him. To be convinced of the advantage of this, was, in his case, to set about doing it with energy and without delay. Straightway, therefore, he applied himself earnestly to the study of Natural Sciences as a private pupil under Dr. Edward Hitchcock, Professor of Natural Science at Amherst College, which was only three miles away. Just then the Prof. was preparing his report on his geological survey of Mass., and out of the fullness of the heart his mouth spoke from morning till night of rocks and soils and soil analysis, and little else, so that a much duller pupil must have been thoroughly crammed in this important branch of agricultural knowledge.

Already young Stockbridge was thoroughly versed in farm practice—could do anything in that line from castrating a pig or lamb to mowing two acres of heavy grass with a scythe by moonlight just for the fun of it. With a fair share of scientific knowledge ere long added to his practical craft, he soon felt a keener interest in his occupation and brighter hopes for the future. He could analyze the soil of the farm, tell what elements of fertility it was deficient in, and what would supply these, just as well as any professional chemist—a knowledge which those who are well acquainted with him, know he has forgotten nothing of until to-day. During the later years of this studious period, he taught school in the neighboring district, boarding at home and attending to the barn chores as well as to the business of the farm generally.

Gradually, however, as the years went by, wife and children, aged parents, the farm and its constantly increasing crops and business drove him away from his study and drew him into the whirl and strain of active life. Little time now for poring over abstruse books when 225 acres of land had to be cared for; hired men to be seen to; and a world of outside business demanded attention. The years of earnest study and earnest work, however, were bearing fruit. The excellent condition of the home farm, and the mental and physical culture that had produced it, inevitably attracted the attention of neighbors on all sides. The owner was consulted here, there and everywhere. He filled acceptably all the offices of his native town; had charge of the schools; was elected assessor and selectman; was chosen representative to the State Legislature four times and to the State Senate twice. Meanwhile, he kept the farm in tip-top condition; had a first-rate farmers' club in the neighborhood and did all he could for the county Agricultural Society, which sent him as its delegate to the Mass. State Board of Agriculture for 12 consecutive years.

In 1865, when he was thinking that he had lived long enough in public life, and worked hard enough, and that a smaller farm and less work would be a paradise, he had an offer for the old farm at war prices, sold and left it, taking a small place of four acres until a more suitable one could be found. There, though far from idle, he had comparative rest for a time, when a fresh duty once more put him reluctantly into harness.

In 1858 he had made an attempt in the Board of Agriculture to have that body inaugurate a movement for the establishment of an agricultural school in Massachusetts, and urged the project until 1860; and later on, in 1863, he did all he could to induce the State to accept the Congressional land grant for an agricultural college, with all its responsibilities and duties. This having been done, he fought valorously in the Board of Agriculture and elsewhere, to prevent the existing colleges from stealing that fund and devoting it to their own purposes. He insisted that it should be used to support an independent agricultural college, for the special benefit of the farmers of the State. His efforts in this direction having been crowned with success, he waited patiently as a spectator to see the work begun. For two years, however, the undertaking advanced only slowly, with many a hitch and jerk, and then "stuck". In the fall of 1866 a new president was chosen, who visited Mr. Stockbridge privately, and said that he would accept the presidency only on condition that the latter would take the position of farm superintendent and business manager.

Pres. Chadbourne was a good man, and Mr. Stockbridge thought he would make the new institution a success, and consequently, to serve him, agreed to go to Amherst and undertake the duties of the offered position for two years, and no longer. Accordingly he began work in April, 1867. Chadbourne did not come. The very week he intended to move he was attacked by hemorrhage, and the whole burden of the new institution fell upon Mr. Stockbridge's shoulders. That was a laborious year. All the plans had been laid out the previous winter, and the manager exerted himself to the utmost to carry them into effect. The college and other buildings were erected; the farm, fences, old lots and land marks were obliterated, and all laid out anew. A busy year truly was it until August, when, for the first time, the trustees met to see what had been done, and to elect Mr. Clark as President. He commenced his duties at once, and, as the buildings were ready, the school was opened on September 1, with 50 pupils. But, although the charter said it was an agricultural school, no provision had been made for agricultural instruction. In this emergency President Clark appealed to the over-burdened farm manager to go into the school about three times a week and lecture on agriculture. As that was something never thought of on his going there, he at first flatly refused on the ground that he had already as much business as he could properly attend to. But what will not steady persistence accomplish! Day after day he was told that there was nobody else to undertake this essential duty, and at length, finding the reiterated assertion true, he yielded his own wishes and ease to the well-being of the institution he had done so much to establish, and until the close of his two years' engagement, in 1869, labored with his customary earnestness in school and out, to impart sound agricultural instruction to all committed to his charge.

LEVI STOCKBRIDGE.—From a late Photograph.—Fig. 44.

In the spring of 1879, his two year's engagement having come to an end, he bought a farm and sent in his resignation. Much discussion followed this step, Mr. Stockbridge insisting on retiring to the rest he had well deserved by a laborious life during the last couple of years of which he had been doing the full work of two men. The college was not yet in a position, however, to dispense with his services, and once more yielding to pressure in its behalf he consented to remain but as Professor of Agriculture with school duties only.

From that day to this, putting his own wishes for a quiet life aside, he has labored devotedly through evil and good report of the institution whose welfare he has so close at heart, to fit young men who have come under his care for success in life, and to advance the best interests of the farmers of his native State in the first place, and then of agriculture everywhere. Lately he has once more sent in his resignation to take effect next spring, but it has not yet been accepted, nor is it likely the college will submit to this loss of his services if they can still be retained by earnest persuasion.

From early childhood to the present day, his life has been assiduously devoted to agriculture, and surely this is a man whom the farmers not of New England only, but of the country at large may justly feel proud of having among their number.

Farm Topics.

THE RECLAMATION OF BOG-LAND BY THE GERMAN METHOD OF BURYING WITH GRAVEL.

PROFESSOR F. H. STORER.

For a dozen years or more, a good deal of attention has been given in Europe to a peculiar method of cultivating bog-land, which seems to have originated upon the great moors of North Germany, but which is manifestly applicable in many other localities, particularly in cold or temperate climates. This process has been occasionally referred to in American publications, and a brief account of it suggested by Prof. Playfair of Edinburg, was printed in the report of the U. S. Commissioner of Agriculture for 1877. In the same year some highly interesting chemical examinations of old fields that had been cultivated in the manner now in question were made by a chemist named Osswald, whose results deserve the careful attention of every intelligent farmer.

The fundamental idea of the German method is to cover the bog-earth with a deep layer of gravel—after means have been provided for draining the land—and to leave this gravel permanently as a surface layer which is never to be mixed with the bog-earth which lies beneath it. Upon this gravel the crops are grown, as will be explained directly. The gravel surface shields the young crops from destruction by night frosts in the spring; it lessens the evaporation of water from the soil, and the radiation of heat, also, and so keeps the land comparatively warm. Moreover, as practical experience has shown, the buried humus can still supply the crops with food.

The layer of gravel might, of course, be

brought to the bog in carts or sleds from hills or pits, in case that plan should happen to be convenient. But upon the great level moors of Europe, where the process originated, there was no alternative but to get the gravel from beneath the moor-earth. It happened, withal, that the excavations made for gravel could readily be put to use as ditches to drain the land.

As explained by Rimpau, to whom the original description of the processes is commonly accredited, there are two general methods of lifting the gravel, one of them applicable to cases where the beds of humus are deep, and the other to the case of shallow beds. Where the layer of black earth is from a foot-and-a-half to three feet thick, or more, the operations consist in digging large, deep ditches, at stated intervals, and spreading upon the surface of the moor the sandy or gravelly subsoil which is taken from the bottoms of the ditches. In Rimpau's practice, the ditches are dug at distances of about 75 feet, one from another; they are 16 feet wide at the top, 11 feet wide at the bottom, and four or five feet deep. The black earth from the ditch, is spread upon the surface of the moor, and then the sand or gravel or clay taken from the bottom of the ditch is spread, in its turn, so that a layer of it about four inches thick shall everywhere cover the moor-earth. A gravelly sand is held to be best; and, in general, the more gravelly the material is, the better, though it is well to have a small proportion of clay in it. Pure, fine-grained quartz sand does not answer nearly so good a purpose as gravel. Oats may be sown at once upon the gravel and afterwards potatoes, roots, grain, and all kinds of forage crops.

The gravel layer is left permanently upon the surface of the land. It is never plowed under or mixed with the moor-earth. But from time to time when the surface land becomes hard or encrusted it is worked with a subsoil plow in such wise that the soil may be loosened without mixing one layer of it with another. It is well, however, in preparing the field, at the beginning, to plow a little of the sand or gravel into the upper layer of black earth so that there may be good capillary connection between the moor-earth and the final layer of gravel. Some writers have argued, also, that it is well to sweeten the moor somewhat, by burning, before proceeding to spread the gravel upon it. The objection to fine sand, just mentioned, is not only that it is liable to be blown away by the wind, but that it dries out too rapidly and chills off too quickly by night. Indeed, one advantage of the method is that the gravel layer compresses the drained moor-earth which would be apt to become too light and dry if it were cultivated in the ordinary way and exposed directly to sun and wind. Another objection to pure sand is that its particles lie too close together, so that a thick layer of it would, when moist, hinder the proper access of air to the humus.

It is still an open question, perhaps, whether this burying process is the most economical method of reclaiming moor-land, but there is no longer any room for doubt that it is a method of very great merit. It has been found in practice that the effects of the reclamation are sure and lasting, and that better crops can be got from the moors in this way than by any other known process.

The most interesting feature of this system of husbandry is the readiness with which crops get their nitrogenous food from the buried humus. Analysis of plants grown on the gravel layer has shown, all along, that the crops taken from moor-land thus reclaimed are particularly rich in nitrogen; and after some years' experience it began to be noticed by the farmers that grain crops are apt to lodge badly on reclaimed fields that are eight or ten years old. On critical examination it appears that the trouble is due to the extreme fertility of the soil, which had not been properly appreciated.

In the beginning, Rimpau's practice was to manure the gravel layer, much in the same way that he would have manured an upland field. But it appears that in so doing he made a grave mistake, for by using stable manure he got too much humus and too much nitrogen into the gravel layer. Osswald's examinations of the soil from reclaimed fields of various ages, from two to twelve years, have shown that the gravel of the older fields had become very much charged with organic matter. Not that the gravel had become mixed with moor-earth from below; on the contrary, the line of demarkation between the moor-earth and the gravel was surprisingly sharp, considering that twelve years had elapsed, in some instances, since the gravel was spread, and that arable crops had been grown upon the land continually. The only trouble was that the continued application of stable manure, and the accumulation of plant-roots, through injudicious shifts in the rotation of crops, had led to an accumulation of humus in the gravel. No very great quantity of nitrates was detected in these old fields. But there was an abundance of ammonia; and it was plain that there was present in the soil a far larger quantity of active nitrogenous manure than there was any need of; or, indeed, than was good for some kinds of crops, as the lodging had already shown.

Instead of being exhausted by cropping, the reclaimed fields had actually become too fertile. They were no longer competent to grow so great a variety of crops, at any given moment, as they had been at first; they still did very well for grass, however. Some of the twelve-year-old fields yielded the best crops of ray-grass, cut over and over again for green fodder, they had ever given; though they had previously been well manured with dung, with superphosphate, bone-meal, and Stassfurt potash-salts.

Speaking in general terms, the continued use of dung upon these fields was a great error. Here, assuredly, if anywhere, the exclusive use of mineral fertilizers will be in order. Here, if anywhere, the farmer may put his trust almost exclusively in the great store of nitrogen which the humus can supply. It has, indeed, been found best, in practice, to use a little nitrate of soda, in conjunction with the mineral manures, at the beginning of the process of reclamation, before the moor-earth has fairly begun to decompose. But there is little or no need of this nitrogenous adjunct subsequently, since the mere oxidation and decay of the humus supply enough nitrogen for the support of most kinds of crops.

It remains to be seen whether after very long-continued cultivation the accumulation of humus in the gravel layer will be large enough to preclude the growing of grain crops, or to necessitate the laying-down of another gravel layer, at enormous expense. But for the present it is plain that pains must be taken to work against the accumulation of humus, both by avoiding the use of organic manures and by growing a proper proportion of exhaustive crops, fit to bring down the exuberant fertility and to promote the destruction of the unwished-for humus.

The other method of lifting gravel, alluded to at the beginning of this article, is with plows. It is used upon moors which have only a thin layer of black earth. When the moor-earth is no thicker than from eight to sixteen inches, Rimpau gets his top layer of gravel or sand by throwing up the subsoil from below by a system of trench plowing. He runs three plows, specially adapted to the purpose, one after the other. The first plow turns a flat slice, three inches or so deep; the second plow stirs the sole of the first furrow to a depth of 12 or 16 inches; and the third plow throws up at least six inches of the loosened subsoil, to cover the inverted sod. These plowing operations are carried on in summer and autumn. Next spring the furrows are leveled with a heavy harrow, and oats are sown. As was said before, it is to be understood that the moor must be well drained before it can be cultivated in this manner.

Farm Economy.

A MUCK BED—WILL IT PAY TO HAUL IT OUT FOR MANURE?

J. B., Union. N. Y., having a large muck-bed, asks which is likely to be the more profitable—to haul it out on his land or to invest the time and money this would cost in superphosphate or some other fertilizer. He can buy yard manure for one dollar a load 1½ mile away; it is coarse, however, and contains a great deal of unrotted straw. He inquires whether Dana's Muck Manual is a trustworthy guide on the muck question. He cuts out the muck or peat at present in August, allows it to dry and uses it as fuel, for which purpose it lasts as long as well-seasoned hard wood, and makes a much hotter fire. It makes a large amount of ashes, but they are lighter than dust, and he asks whether these ashes are anywhere nearly as good as wood ashes for fertilizing purposes.

ANSWER BY PROF. G. C. CALDWELL.

Two objects are generally supposed to be accomplished by the use of stable manure, viz., feeding the plant with nitrogen, potash and phosphoric acid, and, secondly, the improvement of the physical qualities of the soil by keeping up or perhaps even increasing the quantity of humus, or decaying remains of plants. This humus, mixed in with the clay of a heavy soil, makes it lighter, or with a too sandy soil gives it body, and makes it less leachy and hungry, so that manures do not run through it like water through a strainer; and there are good reasons for the belief that humus serves other useful purposes besides this. Now, if muck is to replace stable manure it should contain the same substances and in about the same proportions; but in attempting to compare the two materials as to the quantity of nitrogen, phosphoric acid and potash that they contain, we are met at the outset by a serious difficulty in the great variability in the composition of the former. Prof. Johnson, in analysing 33 samples of air-dried muck, found the nitrogen to vary from nearly five pounds to 29 pounds in 1,000, or an average of 15 pounds. Stable manure in its ordinary condition as spread on the field, contains about 4½ pounds of nitrogen in 1,000. Therefore, as far as mere quantity of nitrogen is concerned, we shall be likely to have in a load of swamp muck of fair quality, which has been exposed to the air for a considerable time till its surplus water is dried out, more, and perhaps a good deal more, nitrogen than in a load of stable manure.

But the same quantity of nitrogen in one case may not make as much of a crop as in the other; a small part of the nitrogen in stable manure is all ready for the use of the plant, while a larger part, before it can serve as food, has to undergo a change in respect to its forms of combination, which requires time. In muck a part of the nitrogen may be, as in stable manure, ready for the plant, but, on the other hand, pretty much all of it may happen to be in this inert and, for the present, useless condition. As to phosphoric acid and potash, the other two substances which are fed to plants in stable manure, muck is usually so poor in them as compared with the manure that they may well be left out of account. This view of the case is supported by the results of some experiments by Prof. Johnson, which showed that by simply adding wood ashes, containing much phosphoric acid and potash, to muck, eight times as much plant growth was obtained as with pure muck. As to the quantity of humus-forming material in muck, that also varies widely; nine-tenths of it may be combustible matter, capable of making humus, and generally over one-half of it is of this character: but where it contains a large proportion of sand, not over a fourth of it may be combustible: it contains the more humus-forming material the smaller the quantity of ash that it leaves when burned. Ordinary stable manure contains about one fifth of its weight of combustible matter; therefore, well air-dried muck may make more humus in the soil than an equal weight of stable manure, with its much larger proportion of water.

It is plain that, without making a chemical analysis of the muck which our inquiring friend has in such abundance, we cannot give him any reliable advice as to its use. He may have a mine of considerable value in his swamp, or, on the other hand, it may not pay to dig it out and carry it even to the nearest field. That it may be valuable is shown by the results of many trials recorded in Johnson's "Peat and its Uses," which, by the way, we recommend to our friend rather than Dana's Muck Manual. It is there stated that some farmers have compared the muck obtained from their own swamps with their stable manure, and have found it to be capable of yielding quite as large crops, at least for a time. In these cases the muck was applied by itself, and sometimes almost in the fresh state. Such a favorable result could, however, be expected only with a muck of unusually good quality, and a kind of soil that needed just such treatment—perhaps a heavy soil, naturally well stocked with potash and phosphoric acid, and specially needing the loosening effects of the muck. In other and more common cases the best results have been obtained by composting the muck with the manure of the yard, thus using it as an absorbent of the valuable liquids which might otherwise run to waste, and as a check on losses which might result from too rapid rotting of the manure. We find in the book above mentioned such reports as these: "A compost of equal parts of muck and stable manure is equal to the same quantity of unmixed stable manure;" or, "Eight loads of muck and four of manure in compost, when properly forked over, are equal to twelve loads of barnyard manure;" or, "One load of stable manure and three loads of muck equal in value four loads of good manure." Such statements made by men who are well known in their respective localities, and whose names are given with them, are worthy of careful consideration.

Our friend may therefore really possess a valuable piece of property in his muck bed; the chemist might help him to decide how valuable it is; but we would not by any means advise him to call in the services of the chemist, for it would cost too much; nor can we show him how to make even a reliable guess as to the quality of his muck from its appearance, whether snuff-colored or black, fine or coarse, or what not; Prof. Johnson could not find anything in the appearance of the muck that could be taken as a sure indication of good quality. There is, then, nothing for him to do but to try it on his fields, and we advise him by all means to do this, but in such a way that he can tell whether it pays or not; if it does not pay he cannot afford to be handling the heavy stuff year after year. He might try some of it by itself on one of his fields, but not with much expectation of profit; he should also try it in his yard, hauling in, if the beds are not too far off, perhaps as many loads as he expects to have of manure. This can often be done in winter when his team and himself would otherwise be idle many days, and the experiment would cost him comparatively little. Then if he is an experienced farmer and knows about what to expect from a load of good stable manure when put on the land, he can soon tell whether or not the addition of his muck to it is profitable. If he does not know from experience what return his yard manure should give him, he ought by all means to go to work at once and get a reliable answer to this question, and especially before he invests in superphosphate or any other commercial fertilizers. Fortified with this information he may the more confidently strike out into new paths, with the feeling that he is in far less danger of losing his hard-earned gains by unprofitable investments in this direction. Positively, in no better way than this can he learn whether his muck is of any value to him, and we insist that its possible value is great enough to make a careful trial of it well worth while. In using it we would suggest that exposure to the air and to frosts always improves it, and that it is well therefore to dig it out some considerable time before it is wanted.

As to the use of peat for fuel, he will find a full account of this matter in the book above referred to. In regard to peat ashes, they also are exceedingly variable in composition, but at their best they are much poorer than wood ashes in potash—the most valuable constituent of these ashes. They are, however, on the average, about as rich as wood ashes in phosphoric acid, so that they are not by any means worthless, and in the compost pile of muck and manure they serve a good purpose as far as they go. They will be likely to be the better in quality, the smaller the quantity yielded by a given quantity of the peat.

Horticultural.

FRUIT GROWERS IN COUNCIL.

Twenty-Fifth Annual Meeting of the Western New York Horticultural Society.

[Rural Special Report.]

THE twenty-fifth annual meeting of the Western New York Horticultural Society was held in the City Hall, Rochester, commencing January 28th, and continuing two days. It was largely attended, and the proceedings were of great interest. The exhibition of fruit was large and the specimens were fine.

The morning of the first day was devoted to the routine business of organizing, appointing committees and hearing the report of the Treasurer.

The AFTERNOON SESSION was opened by the address of the President, Mr. Barry, followed by the report of the Committee upon Native Fruits, Mr. J. J. Thomas, Chairman. He mentioned the fact that in Monroe County the Swaar, Yellow Belleflower, Pound Sweet, Gloria Mundi and Black Detroit had been found to be regular yearly bearers. He found the Brighton Grape to be a superb fruit for the gardener, and recommended the Jones's Seedling pear, both for market and home use. It is a most delicious fruit, being uniformly good and productive.

Following this, Mr. Jones read the report of the Committee upon Ornithology, in which he noted the shy habits of many birds, which render a study of their habits a difficult task. He had known of the canker-worm being destroyed by the cuckoo, and the pea-vine bugs to be the food of the barn swallow. The butcher-bird, he thought, did good service in ridding our fields of the mice. Mr. Green said that the thrush destroyed many insects serviceable in the garden. Mr. Fowler thought the wood-peckers did great service in the winter by ridding our trees of the pupæ of many injurious insects. Mr. Hubbard, of Erie, had known the English sparrow to eat the fruit buds of the Currant, and to destroy the crop. Mr. Harrison said the sparrow was a grain-eating bird. Mr. Woodward said he had seen the sparrows searching for insects, and would not destroy them until he could prove something against them. We have grain enough in this country to feed both birds and men.

Next came the reports of the Committee upon Visiting Orchards. Mr. Moody, of Niagara County, made a few remarks upon the fruit in that county the past year, which was not a favorable one, the orchards near the lake shore not doing so well as those inland, on account of the severe storms early in the season, which destroyed many blooms. He mentioned an orchard of six acres on heavy land, from which 2,100 barrels of apples were taken.

Mr. Hoag gave the statistics of the amount of fruit grown and sold in the county: Of apples there were 300,000 barrels, at $1.60 per bbl.; dried apples, 120,000 bushels, at 20c. per bush.; apples used for cider, 200,000 bushels, at 10c. per bush.; peaches, 250,000 bushels, at 40c. per bush.; cherries, 458,000 pounds, at 3c. per lb.; pears, quinces, plums and berries sold for $25,000, making a total of $662,740, for the total fruit crop of the county. Mr. Gray, of Orleans County, thought farmers made a mis-

take in barreling their second quality of apples. He urged the destruction of the codling moth, and noticed at some length the evaporators for drying fruit, of which there are several in his county. Mr. Jones, of Monroe County, urged the necessity of thorough culture, and the grading of fruit for shipment to a higher and a more uniform grade. Mr. Wing had dried the past season, 20,000 bushels of apples, and was shipping to all parts of the world. He sent apples, dried whole, to Hamburg for apple dumplings. He utilizes the cores and parings by drying them and selling to jelly makers, who pay four cents a pound for them. Mr. Willard, of Ontario County, regarded plum culture as very profitable. Mr. Hubbard, of Erie County, reported the largest crop of apples they had ever had.

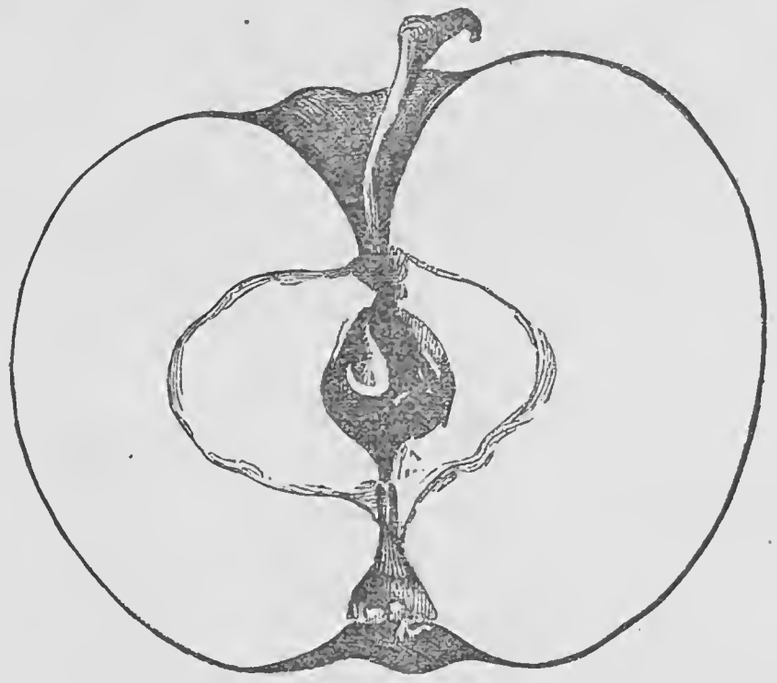
Mr. Thomas read a paper upon the Outlook of Fruit Culture. For success he regarded three things as essential:—1st, locality; 2d, selection of varieties of each kind; 3d, care of the trees. Mr. Handy had practised winter pruning of apple trees and did not approve of it. He preferred summer pruning. Mr. Brooks would prune before the growth started, if it was growth that was not desired. Mr. Thomas thought under certain circumstances plowing orchards was very beneficial. He knew of a young, thrifty orchard that was plowed deeply, and large roots were cut off by it. It bore well the succeeding season and continued to do so. If the trees had been less thrifty they would probably have given different results. Mr. Barry said that in winter light pruning may be done; would prefer to do the heavy pruning in the dormant season, but not in frosty weather. Mr. Moody preferred keeping orchards under the plow.

THE EVENING SESSION was opened by the discussion upon the first question:—"Was there a large crop of apples the past season anywhere outside the area of deep snow last winter? Was the heavy crop partly due to the snow acting as a mulch?" It was thought that the snow had no material effect upon the crop.

Question No. 2 was then taken up:—"What varieties of apples according to the latest experience, give the most satisfactory results both as to bearing and marketing?" Mr. Spence regarded the Bottle Greening as a valuable sort. Mr. Reed regarded it as a fair bearer and a desirable fruit. Mr. W. C. Barry thought it was valuable mainly for its solidity. He had wondered why it was not more popular. Mr. Moody regarded the King of Tompkins Co. as one of the most valuable market fruits. Mr. Bronson had known the King to be injured by the winter and did not regard it as entirely hardy. Mr. Rathbone regarded the Bottle Greening as a better apple than the R. I. Greening. Mr. Hooker had found the N. Spy to be a good bearer but a poor keeper. Mr. Woodward recommended it for Niagara Co., especially for the heavy loam soils having a strong, dry sub soil. Mr. Reynolds had seen the Spy doing excellently well in Wyoming Co.

Mr. Barry opened the next question:—"Have there been any recent improvements in the methods of packing and shipping fruit?" by asking "What is the best method of packing fruit for foreign shipment?" He used paper for wrapping the fruit in, but knew of others using chaff in addition. Mr. Vick had tried several ways, but preferred using strong manilla paper in which to wrap the fruit. In packing in the barrel he placed a layer of buckwheat chaff between each layer of apples, and in the ends put a deeper layer of chaff. He had shipped several kinds with success in this manner. Mr. Hooker objected to the use of the chaff, as it would be liable to impart a flavor to the fruit. He thought that good fruit, packed solidly, would stand shipment to a foreign market. He would advise picking the fruit as soon as matured. Mr. Moody thought well of the plan of having fruit-houses, where the fruit could pass through the sweating process before being barreled. Mr. Hoag had a ventilated fruit-house in which he allowed his fruit to cool, and where he kept it till November. Mr. Moody thought the thorough assorting of apples a necessity; they should be handled quickly and very carefully, and be left in the sun no longer than necessary. Mr. W. C. Barry left his apples in the orchard till they had passed the sweating process. He thought they should not be placed in barrels till after that — nor should they be shipped abroad till cool weather commenced. Mr. Woodward said apples should be picked early and handled but little. When they snapped easily from the stem, it was time to pick them. They should not be barreled till ready for sale. Mr. Clark picked some apples the last week in October, and had but just opened them. He found them to be in good condition.

THE MORNING SESSION, next day, was opened by a paper from Prof. Caldwell, of Cornell University, which was followed by a short discussion upon the question:—"What is the most profitable strawberry for a nearby market?" Mr. Green recommended the Col. Cheney, which was too soft for distant shipment, also the Monarch of the West and the Sharpless. Mr. Jones had found the Champion to be of good size and reasonably productive. Mr. Ellwanger would name the Sharpless and Cumberland Triumph. Mr. Vick recommended for home use, which he thought to be a "near-by," the Triomphe de Gand. Mr. Munson had found nothing equal to the Wilson. Mr. Brooks proposed to send



THE BETHEL APPLE.—FIG. 45.

missionaries to those localities where they grow and eat the Wilson.

Mr. Vick then read a very interesting paper upon flowers and plants—showing the progress made in the history of the Society, which was followed by Mr. Ruhlman's report upon garden vegetables. He regarded the endive as worthy a prominent place in the garden.

Mr. Woodward followed with a paper upon fruit—its influence upon the family and its value as a commercial product. If like produced like, he thought the less pork and the more fruit eaten the better.

The Society then adjourned till afternoon.

THE AFTERNOON SESSION opened with the question "Does it pay the orchardist to grade his fruit according to quality." Mr. Mitchell thought it depended upon the market. Mr. Willard said, it is a question admitting of no argument—you can't afford not to do it. Mr. Younglove said: Keep it up and it will pay. A tasty package is also necessary. Mr. Thomas cited John Morse who had sold one crop of his Bartletts for $9,000. He graded his fruit. Mr. Lazenby had experimented in a small way and found it profitable. Mr. Rumsey wished information in reference to pruning standard pear trees. Mr. Barry recommended but little trimming—the less the better. Mr. Lay would not cut off a limb unless it were necessary. In dwarfs he would shorten in the limbs till they commenced bearing.

Question No. 10 was then called for: "Cultivation of Dwarf Pears.—Can their cultivation be recommended for profit, and if so, what varieties?" Mr. Woodward was not prepared to speak of the profits. His trees were young and growing finely. He fertilized with bone dust, ashes and salt. Would not recommend planting closer than nine by twelve feet. Mr. Willard would say dwarf Pears are profitable if properly handled. Their roots lie near the surface and they need more feed than standards. Mr. Bogue said that on light, sandy soil they would fail, but on good land would prove profitable. He regarded the Duchesse, Beurré Clairgeau and Beurré d'Anjou as the best. Mr. Bogue remarked that the Duchesse did well universally. It wants good rich soil, ripens at the right time for profit and will be planted more than any other. It is remarkably free from blight and is the pear for the million. Mr. Barry regarded the Beurré d'Anjou as a profitable dwarf variety.

"Why will not the standard trees of Duchesse d'Angouleme give as good results as the dwarf?" To this question Mr. Barry replied that he thought the Duchesse as a standard needs age and will do as well as the dwarf when it reaches age.

To the question: "Has any one had experience in thinning the blossoms of fruit trees; if so, how is it best performed, and what has been the result?" Mr. Thomas said that removing the blossoms from old trees was expensive, and did but little good; but if practiced on young trees the bearing year could be permanently changed.

"Are any of the so-called hybrid Grapes worthy of being recommended for cultivation for vineyard purposes?" In answer to this question, Mr. Green thought that no hybrid could be recommended for ordinary planting. Mr. Stace said his experience was that the hybrids did well a few years, then became diseased and were good for nothing. Mr. Merrell had vines of Rogers's Nos. 4, 15, 19 and Salem planted fifteen years and still healthy and doing well. Mr. Hubbard said that generally the Rogers's did not seem to deteriorate. Mr. Younglove had found Rogers's Nos. 15, 4, 43, 14 and Salem for fifteen years to be uniform bearers, good growers and first-class vineyard Grapes. Mr. Clark had an acre and a half of Rogers's No. 4, which for five years had yielded an average of $200 per acre. Mr. Farley had fruited the Rogers's Grapes ten years. He found Nos. 4, 33, 15 and 19 to be profitable. Had had but little experience with other hybrids.

EVENING SESSION.—The first question was: "What can we do to prevent the premature dropping of the quince leaf?" Mr. Green thought it was occasioned by the slug. Mr. Woodward thought it to be caused by plowing away from the tree. Soil seemed to make no difference. It was to be avoided by cultivating up to the tree. Mr. Hoag thought cultivation had nothing to do with it. On low ground the disease was prevalent; but not on high ground. Mr. Bogue stated that last year leaves dropped in June. Mr. Jones had noticed it in nursery rows. The Rea's Mammoth was especially liable to it. The Augers next and the Orange free from its attacks. Mr. Bronson had found that trees in low places held their foliage while those on high ground did not. Mr. Dorman had 1,500 trees mostly on low land. They dropped their leaves but slightly; whereas those on upland dropped their leaves badly.

The next question was: "What are the six best plums for market?" Mr. Hooker named the Monroe Egg, a light-colored plum of moderate size. Mr. Woodward said the Lombard was badly infected with the black-knot in Niagara Co. Mr. Hoag liked the Washington and Yellow Egg. Mr. Barry named the McLoughlin as being of the very best quality. Mr. Jones mentioned the Reine Claude de Bavay as being very popular upon the Hudson River.

Mr. Root regarded the Lombard as the most profitable. Mr. Beadle, of Ontario, said the Lombard was the freest from black-knot with him. Mr. Barry named the Coe's Golden Drop as a valuable sort. Mr. Barry said the Prunes all do well and are profitable. Mr. Zimmermann found that the Italian held its leaves better than the German Prune.

In answer to the question, "What are the best four varieties of grapes for the family use?" the Society names the Delaware, Brighton, Concord and Martha.

The question:—"What sized apples pay best to ship to Europe?" was then discussed. Mr. Ellwanger found the King of Tompkins Co., to be a favorite. Mr. Vick said, the larger the better; the brighter the better. Large Baldwins go well—Northern Spy is best. Mr. Salter asked if the King of Tompkins Co. was generally considered hardy. He had not found it to be. Mr. Allis, of Orleans Co., had found it to be perfectly hardy. It bears yearly with him. Mr. Woodward said that on some soils it twig-blights badly. Mr. Zimmerman had found it to be a shy bearer and sickly in Erie Co. Mr. Root thought it liked high altitude the best. It sells well and does well in Onondaga Co. Mr. Lazenby said it did well in Tompkins Co. The Farmers' Club there, two years ago, by a unanimous vote placed it at the head of the six most profitable apples, and it was the only one of the six which received a unanimous vote. Mr. Hooker had found it apt to blow off; but the good apples sell well.

The society then discussed "New Fruits.—What has been the experience of the past year with new varieties of fruits?" Peaches were first taken up. Mr. Woodward said the Amsden June was worth nothing as an orchard fruit. It rots as badly as the Hale's Early. Mr. Younglove wanted a better market peach than the Early Crawford. He had heard of the Wheatland and wanted to know something about it. Mr. Rogers, the originator of the Wheatland, said that it ripened directly after the Early Crawford. It is handsome in appearance and sells well. He liked the Foster—it pleases every one. Mr. Green liked the Foster better than the Early Crawford. It is more even in size. Mr. Younglove had found both Foster and Early Crawford to be lacking in vigor of constitution. Mr. Hooker did not feel disposed to recommend any of the class of early peaches. They are punctured badly by insects, and can not be grown with profit. Mr. Barry said the Amsden June, the past season, was smooth and fine in appearance, and not at all infested by insects. Mr. Younglove regarded the Early Rivers as the only early one really profitable. Mr. Boyne called the attention of the members to the Lulu, which fruited this year for the first time, at Batavia, where it ripened Aug. 1st, being two weeks ahead of the Amsden.

The new Grapes were then taken up. Mr. Craine regarded the Niagara and Prentiss as being desirable acquisitions. Mr. Farley spoke of the Duchess. It had fruited for ten years in various localities, and, so far as he knew, there had never been a report to its prejudice from those who had tested it. He had never heard of mildew, leaf-blight, or any other disease affecting it which he had not seen on the Concord. Mr. Hubbard did not regard the Moore's Early as of very good quality. Mr. Farley thought the Worden had been overlooked. It was earlier and better than the Concord, larger and finer in growth. The skin is a little thin and it is not adapted for market. Mr. Hubbard had not found it to be much earlier than the Concord.

New Strawberries were then enumerated. Mr. Green found the Brilliant, sent out by Storer of Ohio, to be handsome in appearance. The Marvin is showy and productive. The Pres't. Lincoln is one of the finest large berries we have. The Glendale is valuable as a late bearer. Mr. Hubbard did not regard the New Dominion as of any value upon gravelly loam. Mr. Green also spoke favorably of the Reliance and Gregg Raspberries.

Currants were discussed next. Mr. Hooker asked for information about the Black Currants. He found the Black English to be an upright grower and a small cropper. The Black Naples was not so rapid a grower, but a better cropper. Mr. Barry said the Lee's Prolific had a longer bunch than either of the others. Mr. Hooker had found the Lee's Prolific an abundant cropper. Mr. Fish said that the Naples leafs out earlier than the English. Mr. Jones had found the Lee's Prolific to be of upright growth, the fruit to be of large size, and the plant a very abundant yielder.

The Society then adjourned *sine die*.

Pomological.

THE BETHEL APPLE OF VERMONT.

T. H. HOSKINS.

THIS variety is a favorite one in the orchards of the White River Valley of Vermont, comprising a part of Orange, Windsor and Washington counties. The original tree in the town of Bethel is still living, and is reported to me as having produced "two barrels of splendid apples in 1876." The Bethel has caused some confusion by its similarity to other apples, and was a few years ago pronounced by C. M. Hovey and other Massachusetts experts, as being "undoubtedly" the Murphy. On the other hand, Mr. Downing thought it might be identical with an apple of St. Lawrence Co., N. Y., known as the Stone Apple, but he now writes me that he is satisfied that it is not the same; though, singularly, the Stone, has as a synonym, the name of Bethel given to it. But this may have been done by some Vermonter, who noticed their similarity. I have been favored with a specimen of the fruit of the Stone, and also with the wood, and recognize distinct differences between that variety and the Bethel of Vermont.

In rich lands the Bethel is regarded as the best substitute for the Baldwin north of the line where that variety is found unable to endure the severity of our winters. The Bethel is hardy, even to the Canada line; of good size, fine color and excellent quality. It keeps well through the winter, but not long into the spring. However, there is a "but" in everything, and the "but" in the Bethel is that it requires a good soil, preferably a river valley soil, to bring it up to profitable productiveness. On the hills, unless well cared for and manured, it is complained of for lack of productiveness.

The Bethel of Vermont is in size large; in form roundish-conical: basin shallow, slightly corrugated; calyx closed; cavity deep and narrow; stem short and slim; color a rich yellow, with bright crimson stripes over nearly all the surface, much exposed specimens being sometimes almost solid in color and dark red; flesh, yellow; core medium; seeds very long and pointed; flavor rich mild subacid; quality very good. Season January to March. A very constant characteristic of the fruit is that it appears laterally compressed, and a transverse section is therefore oval or ovate, generally the latter. [The above engraving is from an apple sent in by Dr. Hoskins.—EDS.]

Orleans Co., Vt.

Sheep Husbandry.

WHAT BREED OF SHEEP PRODUCES THE BEST MUTTON?

This is a question that may be well asked, now that a great demand for mutton sheep to ship alive and in the carcass, has sprung up for the British and other foreign markets, and that the consumption, also, is rapidly increasing at home.

Of all breeds in England, the South-Down has, from time immemorial, taken precedence. This, however, is beginning to be shared at the present day with other Downs, under the name of Oxford, Hampshire, Sussex, Shropshire, etc., the prefix being taken from the county in which the native sheep possesses the make-up and family likeness of the South-Down. All these are of quicker sale and command a considerably higher price per pound than any other breeds.

The reason of this preference is, that they are encumbered with less offal and the bones are finer. The flesh is better marbled than with others, and more lean, tender and juicy throughout the carcass. It is these qualities which recommend it so highly to the lovers of good mutton, and render it the most palatable and economical of all for consumption; no messes of uneatable, coarse meat, or lumps of fat here to be thrown aside, fit only for mutton tallow. In addition to the meat being more palatable when cooked, the hams and shoulders, after moderate salting, can be smoked and eaten shaved into thin slices, like dried beef. They are then scarcely inferior in quality to venison hams, and may easily pass for such, thus making them a cheap luxury for the tea table.

Down sheep are unquestionably the best sort for our farmers to breed most numerously among their flocks for exportation, as, in addition to the superior quality of their mutton, they are extra hardy and prolific, mature early, are quite easily kept and fatten quickly. They shear large fleeces for their size, of a middle quality of wool, which commands a good price in our markets. It works freely with the manufacturer, and makes strong, excellent cloth.

Of the various breeds of Down sheep, it is getting to be the opinion of many, that the Oxford, on account of its greater size, will prove to be the most profitable to rear for the English market, as, other things being equal, the larger takes precedence there, more especially for the production of early lambs. From information recently received from England, I learn that the average weight of Oxford-Down lambs bred there with good farmer's keep, after being dressed and the head taken off, is 32 to 40 pounds at three months old; 48 to 56 pounds at six months; 64 to 72 pounds at nine months; and 80 to 96 pounds at 12 months.

These are great weights, and as early lambs bring an extra price, the profit in breeding and rearing them must be considerable. Moreover, their sale is sure, and the price not subject to fluctuation. Older ones are of corresponding weights, and when properly fed and cared for, fully mature at 18 to 24 months old, which enables the farmer to turn his capital so much more quickly. This gives him an additional profit over and above later-maturing and slower-growing breeds.

Rams can be put to moderate service at six months of age, though it may be better, as a general rule, to keep them back a few months longer. Ewes may be served to drop their lambs without stunting their growth, at 18 to 24 months' age, according to their size and constitution, and these first lambs do as well as any subsequently dropped, provided good care is given to both dam and offspring. The ewes often drop twins and occasionally triplets. From this it is seen how rapidly a flock can be increased, and how precociously this sort of sheep safely breeds.

In order that the reader may better judge of the merits of Oxford-Downs, a group of these noble animals, bred by Mr. Cooper, of Coopersburg, Pa., is here introduced as an illustration of their form and character; and I am assured by impartial judges, that the portraits are not at all flattering.

I have given the dressed weights above of different ages bred by the ordinary farmers of England. Mr. Cooper informs me that the live weights of a pick of his largest at two months old, is 60 pounds each; at four months 80 pounds; at six months, 115 to 120 pounds; and he is confident if pushed on to 12 or 13 months, they might weigh from 150 to 170 pounds. I have seen the weights of full-grown prize Oxford-Downs, reported at English agricultural shows, repeatedly reaching from 250 to 275 pounds, and in one instance it was over 300 pounds. This shows what can be done in the way of single specimens by long, high training, and enormous fattening when particularly desired by breeders. I am of opinion, however, that such large specimens of the Oxfords would not be so profitable to rear and feed as those of medium weights, like the dressed which I have given above; and I doubt whether the flesh would be of so high a quality. But these things can only be proved after a fair trial.

My advice to those who have light soils, or stony or hilly land, is to choose sheep of medium size; but those who possess rich lands yielding abundant crops of grass, roots, and grain, may as profitably, perhaps, rear those of the larger size.

A. B. Allen.

New York.

Various.

DIRECTIONS FOR PUTTING UP FRUIT TO BE SENT BY MAIL OR EXPRESS.

Mr. Charles Downing favors us with the following instructions: Select a characteristic specimen, viz., one of average size, color, form, etc.—perfect or one that will give a fair representation of the variety; put it in a tin, or thin wooden box (paper boxes, unless very stout or double get broken or mashed in the mail bags); fill the spaces around the fruit closely with paper, cotton, or some light material to keep the fruit in its place; put a paper wrapper over the box; do not seal or paste it (contrary to law); but tie it firmly with strong twine on each side of the box; put postage stamps on the wrapper to the amount of one cent for each ounce of weight; also put the name of the fruit in the box, so that the person receiving it may know what the variety is.

When to be sent by express, put each variety separately in a paper wrapper or paper bag, with the name on a slip of paper or card; then pack each parcel closely in the box, and if not quite full, add paper, shavings or something of the kind, so as to hold the fruit firmly and prevent bruising. Put the address in full on the lid of the box. Always select fruit of average size, color and form, avoiding alike the largest as well as the inferior specimens.

Rise in Prices of Ag'l. Implements.

It is doubtful whether there has ever been so much activity in the iron business as at the present time in this country. Blast furnaces that for the last decade almost, have been cold and useless, are now making pig metal to their fullest capacity; rolling mills are working in some cases day and night; but the home supply is still much less than the demand, and the iron works of England and Belgium are working hard to supply the deficiency. During the past week two vessels were loaded with 5,000 tons of steel rails in Liverpool, and it is reported that 13 other vessels are waiting to be loaded entirely with iron for this country.

The farmer is greatly interested in this briskness in the iron trade, inasmuch as all goods into whose make-up iron enters are rising in price. A week or two ago all the plow-makers of the Northwest met at Chicago, formed a combination to regulate the prices of their wares, and began at once with an average rise of about 10 per-cent. Nail makers, stove makers, in fact, all branches of iron manufacture are also advancing prices. Mowing machines will go up probably at least $10 each, next season, hay rakes about $4, and other implements in proportion. Wood, wages, all things are advancing in price, and those who intend to buy, must look forward to pay high figures for their purchases.

To Subdue the Craving for Alcoholic Drinks.—Dr. Norman Kerr recommends a decoction prepared as follows:—

Powdered cinchona bark	1 ounce.
Water	1 pint.
Dilute hydrochloric acid	100 minims.

Boil for ten minutes, and strain when cold; pour boiling water on the contents of the strainer till the product measures one pint. Of this give a wineglassful every three hours, gradually diminishing the frequency and quantity of the dose after the first day, till in six or seven days it is reduced to a teaspoonful three times a day.—Boston Journal of Chemistry.

Dairy Husbandry.

MILK AND BUTTER.

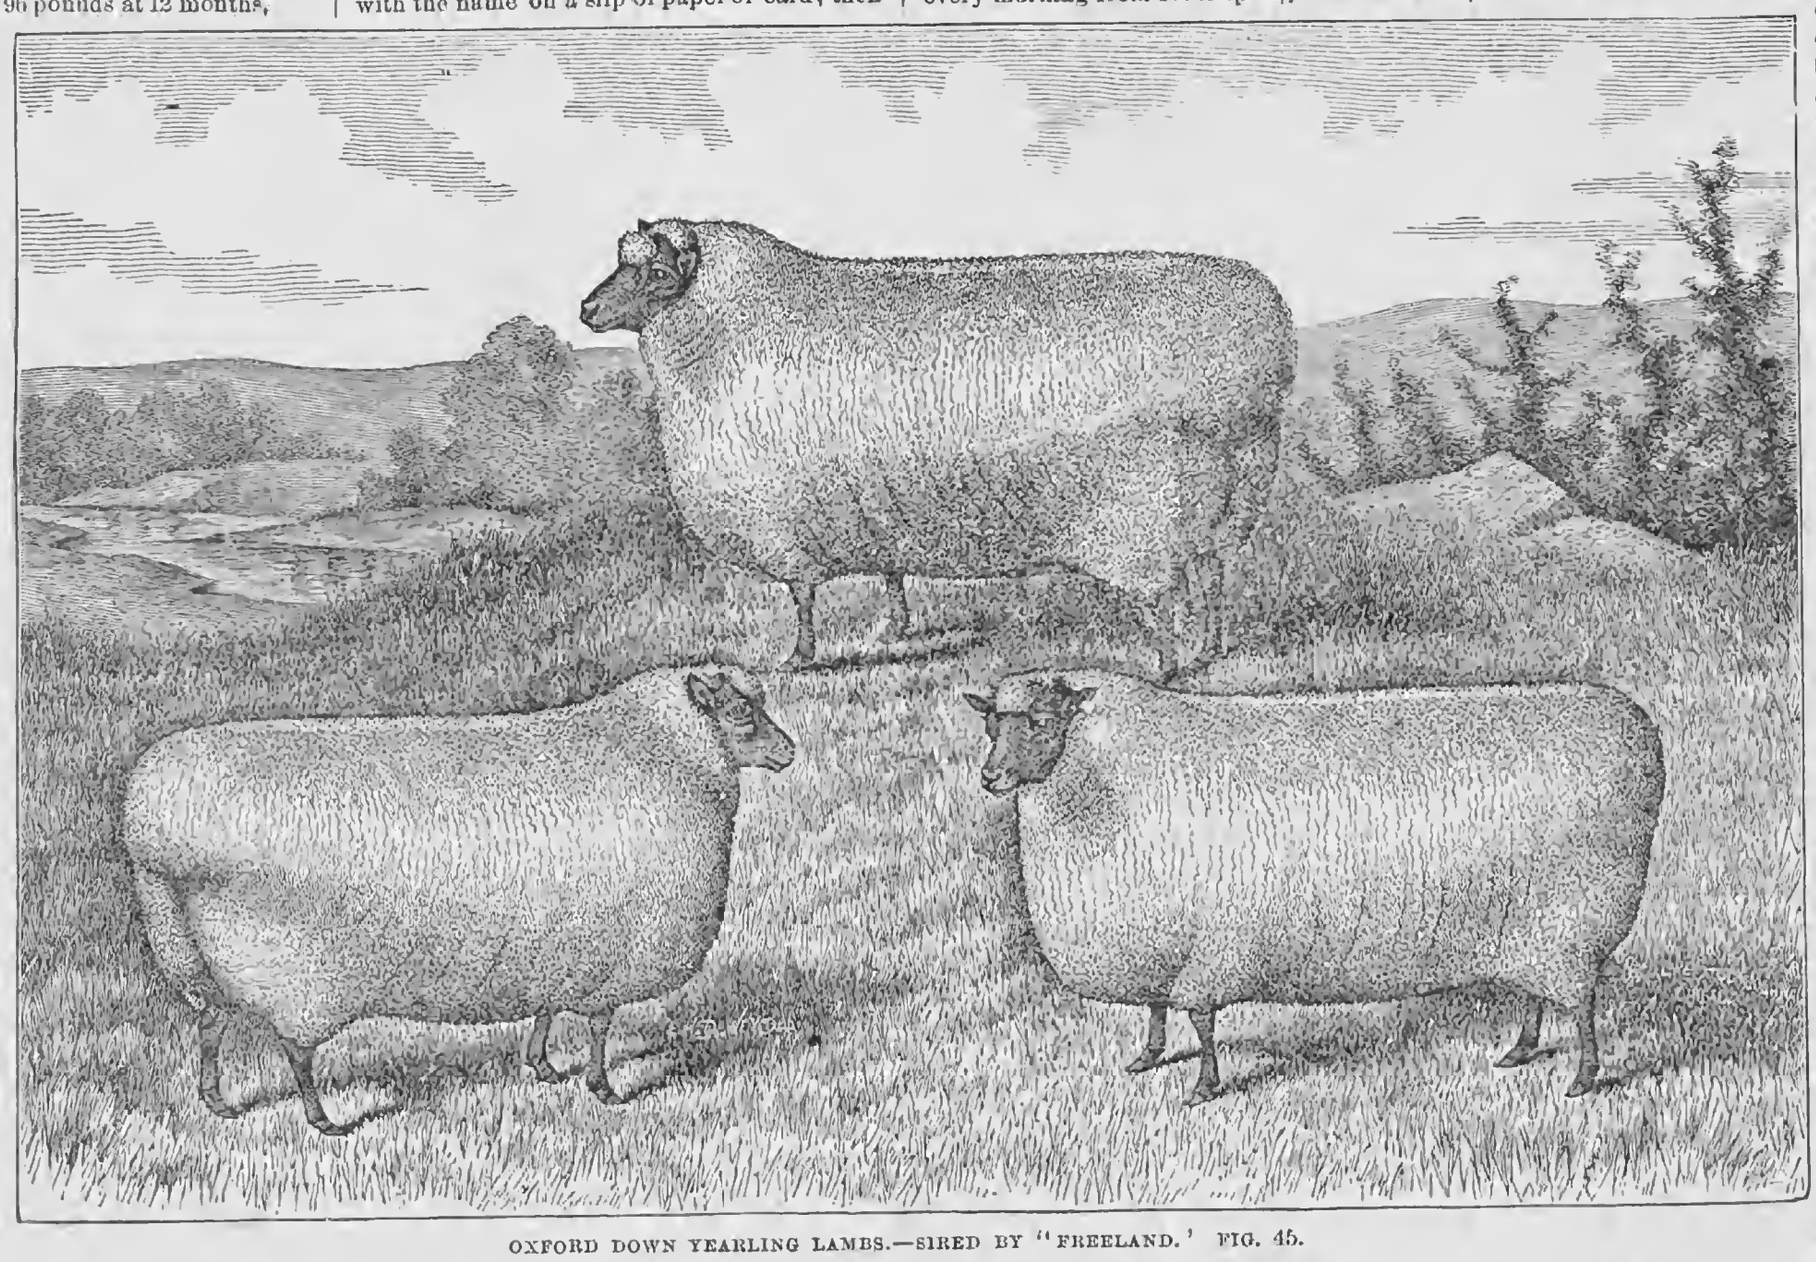
RICHARD GOODMAN.

As society gets more civilized, its tastes become more refined, its appetites more delicate and discriminating, and those who provide for its necessities and pleasures have to take into consideration these important factors and advance the quality of their products accordingly. It is not such a very great number of years since the citizens of New York got their drinking water contentedly from the corner pumps, or had it as an extra luxury brought every morning from some spring. Their milk was generally purchased at the corner grocery from a penny's worth to a pint or quart; they went directly to Fulton and Washington Markets for their meat and vegetables. Water-closets and other now prime necessities were unknown; omnibuses alone carried the comparatively few who were unable to walk; ladies did their shopping on foot, and men of business took their dinners at chop-houses down town instead of, as now, going home and dining comfortably and socially with their families. If a young man wanted to play billiards, he had to go into some saloon where he was tempted to drink and smoke for clubs where gentlemen could indulge in innocent amusements, were rare, and that family which allowed a billiard table in its house was ostracized by all *good* people. The only butter to be had was that put down in early summer or fall for the ensuing winter, excepting that freshly made during the spring and exposed for sale in the market. Now all those who can afford it, desire fresh butter all the year round, and are beginning to realize the value of pure, unwatered milk, and nearly ready to pay a fair price for each of these articles, if they can be obtained.

Most of the instructions in the agricultural papers are for the benefit of the farmers who are taught by scientists and specialists how to produce pure and rich milk and manufacture and market superior butter. The immediate effects of adulterated milk and the tests, however imperfect, of the lactometer and kindred guages, have made the well-to do citizens realize that the most effective measures should be taken to secure the purest article, and such efforts as are being made by the Westchester Association, and the introduction of milk in glass bottles sealed up and delivered directly to the consumer, together with the rigid enforcement of the laws which inhibit "distillery milk" and any adulterations of the lacteal fluid, will protect the people as far as possible against impurity. But they need to be instructed also that to have either milk or butter of the best quality, they must be willing to pay a fair price so that the farmer shall receive a living profit. They are about brought up to the point of believing that pure, rich milk is worth eight to ten cents a quart and that the farmer only receives one quarter of this sum, the remainder being consumed by the charges of the middlemen, transportation, etc.

Now, if milk is worth from six to eight and ten cents a quart, how can the consumer expect to get good butter for 25 to 30 cents a pound, when it takes, on the average, 12 quarts of milk to make a pound of butter: from ordinary cows 12 to 20 quarts of milk are required to make a pound of butter. The milk of some of the thoroughbreds is much richer, and that of the Jersey cow, noted for her special butter-making qualities, is capable of occasionally producing a pound of butter from five quarts, but a fair average is about eight quarts. At six cents a quart such butter would be worth 48 cents at the minimum cost, and, as a matter of fact, *good* fresh butter cannot be put into the market, except, perhaps, for a short season in the early summer, at less than 50 cents a pound, and give the careful and cleanly farmer a living profit. I know the towns and cities are full of cheaper butter; but we find that at our annual exhibitions, cattle shows, fairs and even those, where dairy products are entered for special premiums, not over one-quarter of the butter shown is fit for the table, and a somewhat extended acquaintance with the business and with the farming community in New England, convinces me that the good *clean* butter-makers are few and far between.

For these reasons creameries which *compel* attention to neatness and purity of production, and combine capital and labor in great part, can afford to sell an excellent article of butter at about 40 cents a pound; but the enterprising, industrious dairyman who possesses cows of a uniform richness of product, and carries out his processes from stabling and milking to the final "patting" and covering, can, if he or his wife *knows how*, make butter which, for color, flavor, grain and hardness, will surpass that of the creamery and be worth 50 cents a pound. When our rich and well-to-do people who love good butter, are sufficiently instructed



OXFORD DOWN YEARLING LAMBS.—SIRED BY "FREELAND." FIG. 45.

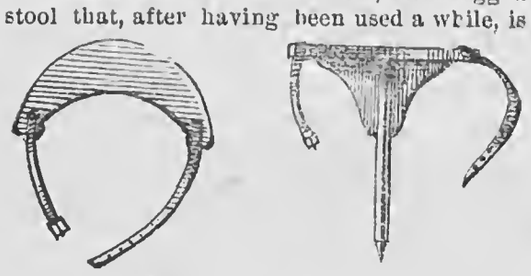
to realize that it is more profitable and more wholesome to purchase such butter for *all* the uses of their families, instead of buying a pound or two a week of butter no better for a dollar a pound, and using very inferior quality for cooking, thus injuring their food and stomachs, it will come into the market in sufficient quantities. As it is, the customers who will buy *cheap* butter are so numerous that it is no wonder the markets are flooded with that country-store mixture called "Irish butter," and that "oleomargarine," which if properly made is far more healthful and less nauseous to smell and taste, largely usurps its place in public estimation.

Whilst the farmers are being taught in public prints, and at International, State and county dairy associations and fairs, how to make good butter, and all the secrets of science and the ingenuity of man are disclosed and employed for their benefit, and they are deluged with pamphlets and prospectuses enforcing upon their attention the new projects, creameries, implements and processes, it is but fair that the much larger number of people who consume their products, should be made to realize that butter-makers, as well as milk-producers, have to live by their calling, and that they cannot work day after day to produce a uniform, cleanly and superior article, without a corresponding return for their labor. The art and processes for superior butter-making are the possession of a limited number, and those that do put on the market an article which commends itself to all who test it, are deserving of at least a pecuniary reward which will enable them to continue to make and sell what all want but few are willing to pay for.

Yokun Farm, Lenox, Mass.

A GOOD MILKING-STOOL.

THERE is nothing about the dairy barn harder to keep in order than the milking-stool. The common form in use is a low, three-legged stool that, after having been used a while, is



MILK STOOL.—FIG. 47.

sure to have the legs dry up so that they will not stay in the sockets. The consequence is that the stool about one-half the time has but two legs, and consequently is perfectly useless. The common substitute is a small box, and this has to be picked up and set down several times while milking one cow and disposing of her milk. All this trouble is avoided by a device of the Swiss milk-men. They use a stool with but one leg properly braced to keep it from dropping out of the seat. This is cut in the shape of a quarter moon; at each end of the seat holes are cut, and a strong leather strap passes through them. When the milk-man enters the stable, he takes this stool down

MILK STOOL IN USE.—FIG. 48.

from a nail where it has been hanging, fits it to his seat and buckles it firmly around his legs. With this he walks about, or sits down at pleasure, with no further thought or trouble about his milking stool. The bucket he holds between his knees when milking, and there is a spike in the one leg to keep it from slipping.

L. S. HARDIN.

WARM COWS.

I WANT to give my experience in trying to carry out an adage which has crept from agricultural journals to journals of agriculture for about a year past, and which has brought me to grief. The adage says, "The warmer stables are kept, the less food is required for the stock." I at once got out my multiplication table, and having found that the average temperature of stables in winter was 32 deg. (according to the number and size of the cracks), I tried to solve the question:—If an uncertain degree of cold caused a cow to eat her head off in six months, what positive degree of heat, according to the aforesaid "adage," would enable her to live without eating altogether, and thus keep her head in proper place, "agin grass come?" Experiment only could decide this question; so I first tried pulse warmers, with no perceptible effect; then I had made a red flannel sack embroidered with green silk to represent *Graminia gracilis*, but her appetite only increased. A neighbor proposed a self-heating rotary grate furnace, which at once showed signs of doing some good; she soon got into a profuse perspiration and refused food altogether. We kept up the fire, and she lolled out her tongue, which shed a copious stream of water, proving that she was not thirsty. Continued this course for a week, when she laid quietly down and made no sign. Sent for a vet. M.D., who thought we had been too sparing of fuel, and by his advice, put some of her flesh on to boil, and at 212 deg. Far. solved the problem. Cows kept in stables warmed up to that degree require no food. Q. E. D.—Now, who wants to pay me for that cow? Stamps taken.

S. RUFUS MASON.

Field Crops.

THE COW-PEA IN NORTH CAROLINA.

THOUGH this southern Cow-pea requires and also receives less cultivation than any other crop, it is grateful for any extra attention in the way of fertilizers or stirring of the soil. The practice of Mr. G. Twisdale, one of the most successful growers in this county, is, first, plow the land in April; then, about June, first run off the rows with a plow, about 2 to 2½ feet apart; drop five to seven peas, 15 inches apart, in the row; cover with a cotton coverer; work once with a horse. Except a few saved for seed, the whole crop is fed by hogs. In answer to inquiries, Mr. T. says: "I plant less than one bushel per acre. Have tried many varieties, and prefer the blacks. I consider 30 bushels per acre a good crop. Can make more pork from peas than from the same field in corn, with one half the labor, besides leaving the land in much better condition. I feed them to my horses without any ill effect." The writer, from experience, agrees with Mr. T. in regard to peas as food for horses, though the popular notion is that they are prolific of colic.

As probably many Ruralists will try the Cow-pea this year for the first time, a few hints as to the cultivation may not be amiss:—Early planting is to be avoided, the usual time of planting beans is a fair time for planting Cow-peas also. Plant them in poor soil; if light and sandy, so much better. If growth of vines is desired, the soil cannot be too highly fertilized. Like English peas, they can hardly be planted too deep, especially in light soil. They germinate very soon. With the soil in proper condition as to heat and moisture we sometimes have them showing their vinelets above ground in three days. With suitable soil and climate there is no more desirable crop. Give them half a chance, and they will look out for number one. There are almost numberless varieties, the chief distinction being in the size, form and color of the ripe grain. The growth of the vine is more dependent on the soil than on variety.

M. B. P.

Warren Co., N. C.

"And Now Comes California."

In "Brevities" for January 3, the RURAL states that a premium was awarded by the Territorial Fair Association of Montana for the best acre of wheat, to a yield of 102 bushels, and inquires whether any one ever heard of a larger yield—outside of Munchausen Land. It says it hasn't.

On page 235 of the Report of the Commissioner of Agriculture, for the year 1871, is the following:—"Wheat in California.—Mr. Rafael Pinto, of Watsonville, California, states that in 1871 he raised 800 centals of wheat on 14½ acres—an average of 93 bushels per acre—and that many acres in Pajaro Valley gave a much larger yield. Two acres, cultivated by Mr. Daniel Tuttle, of Watsonville, produced 12,360 pounds of English club wheat, or 103 bushels per acre, which was sold on the ground, without sacks, at two and a half cents per pound, returning $154.50 per acre."

Who can beat this in the way of a wheat story?

H. L. W.

THE BLOOMSDALE SWEDE TURNIP.—In 1878 I received from the RURAL, a package of the Bloomsdale Swede turnip seed, but neglected to sow them until the past season, when the result was an agreeable surprise. Myself and family unhesitatingly pronounce it the best turnip for cooking that has ever come under our observation. The flesh is a rich yellow, the flavor fine, and, besides, it yields well. N. R.

The Vineyard.

THE EUMELAN GRAPE.

THIS Grape was found in a private garden at Fishkill, N. Y., where it had been grown a number of years, without attracting much attention, by Dr. Grant, of Iona and Israella fame, and introduced by him and his successors, Hasbrouck & Bushnell, with the same high encomiums that attended those varieties, and it has come about as near realizing the position claimed for it as they have. Where it does succeed, it ripens before the Hartford, a black grape of full, medium size, of excellent quality. Belonging to one of our native species (Æstivalis) it ought to be hardy and healthy generally, but proves so only in isolated localities, like its predecessors, Iona and Israella. Some reliable authorities give it a character for strong growth with thick, firm foliage, but with us it is a feeble grower and as subject to mildew as fully as, or more than, the Iona, Israella or Delaware. Whether this is due to an impaired constitution induced by excessive or doubtful methods of propagation, or to an inherent lack of vigor in the variety, I am not prepared to say; I only know that we have never yet been able to make a respectable vine.

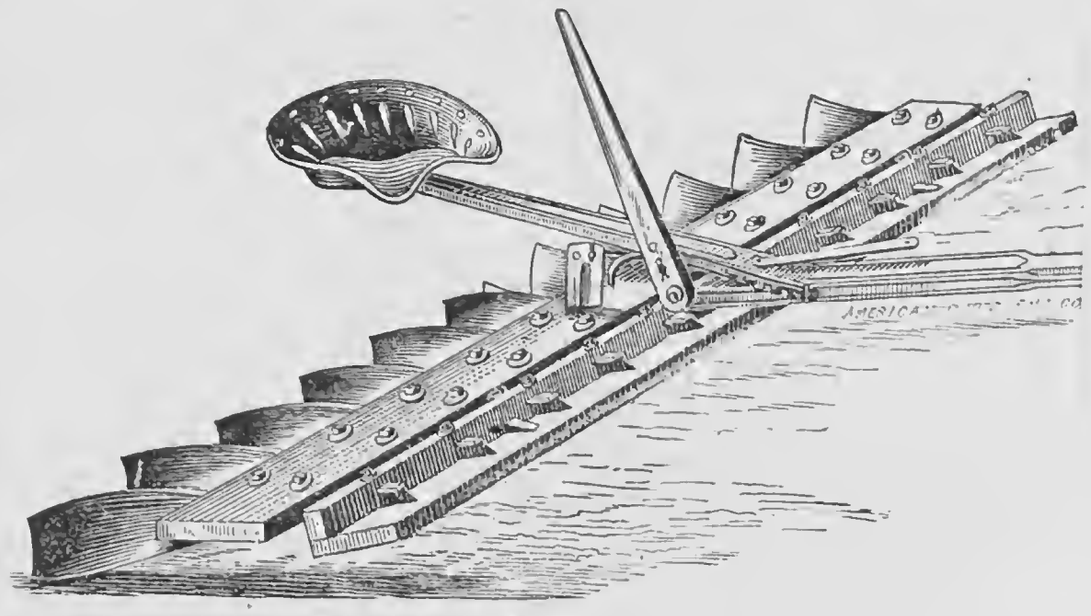
Mr. Bush, of Mo., says: "Perhaps with no other variety is it *so* important to set out only *good* and *strong* plants in the first place, as with this one, and I think that the great diversity of opinion now existing in regard to this Grape is due to the fact that a large number of the vines of this variety sent out have been poor and feeble plants, which have never come to any good thereafter, and never will."

E. W.

Industrial Implements.

THE ACME STEEL PULVERIZING HARROW.

THIS excellent implement, the invention of a man who is himself a practical farmer as well as a mechanic who had previously invented the revolving disk or wheel harrow, seems destined to win a wide popularity once its many merits become known. On its behalf it is claimed that it will crush clods completely, level rough land, thoroughly pulverize inverted sod without turning it, as well as soil that has become baked after plowing, save cross plowing, cover the seed to a uniform depth, and do its work without packing the under soil. Moreover, as it is a pulverizer, clod crusher and leveler combined, it is very economical of labor, and as it is made entirely of wrought iron, steel and wood, it is strong, durable and light, weighing only 126 pounds. Broad as are these claims, they are strongly indorsed by a large number of practical farmers who have tested it under various conditions of soil in N. Y., Mass., N. J., Pa., Va., and other States. Among the long list of testimonials to its efficiency the names of Levi Stockbridge and J. J. Thomas, inventor of the Thomas smoothing harrow, will justly have great weight with farmers everywhere.

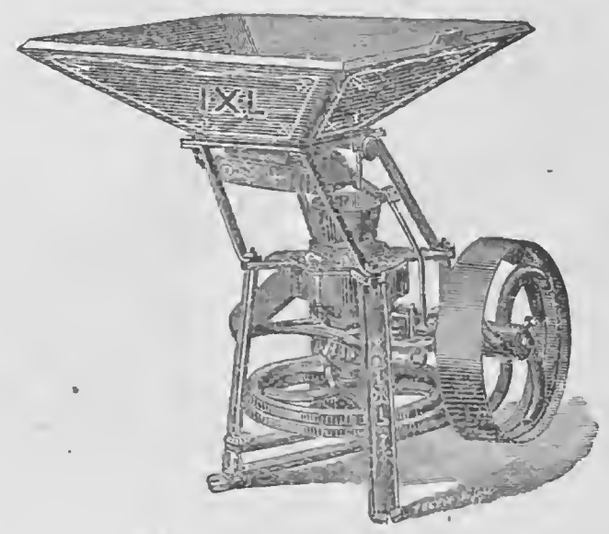


ACME STEEL PULVERIZING HARROW.—FIG. 49.

As seen in the accompanying cut, it consists of a clod crusher and leveling bar or beam permanently secured to the tongue or draft pole, having under its rear a series of steel spurs. This crusher which is provided with ten steel cutting teeth, serves to grind down and force the clods under the coulter teeth which are bolted to a separate beam, or tooth bar, hinged to the rear of the crusher. The tooth bar is provided with 12 curved steel coulter teeth which throughly cut, lift and turn the soil, so that it is successively subjected to the operation of the leveler, the breaking spurs, and the steel coulters. A lever within reach of the driver enables him to control the position of the crusher and at the same time to raise or depress the coulters to regulate the depth of work, which varies from a light surface working to a complete pulverization to a depth of three or four inches In view of its durable construction, its completeness and efficiency this is certainly a cheap implement at $22. In a brief notice like this, its salient points only can be glanced at; but full information will be furnished by its manufacturers, Nash & Brother, 22 College Place this city.

THE I-X-L MILL.

OF the advantages of grinding grain for stock so many proofs have already been made public that to speak of the matter here would be superfluous. Up to the present time, however, by far too little attention has been given to the great importance of grinding the cob of corn with the grain for feeding purposes. The great advantage of this measure has been strongly set forth by some recent experiments in hog-feeding, made by a committee appointed by a couple of Conn. Farmer's Clubs, the results of whose experiments were given in full by Professor E. W. Stewart in the RURAL of Feb. 7. From these it appears that very nearly as much gain was made in fattening hogs on corn-and-cob meal, as on clear meal. While it required 4 34 pounds of clear meal to gain one pound in live weight and 5 68 pounds for one pound dressed weight, it required only 4 63 pounds of corn-and-cob meal to make one pound of live weight and 5 93 pounds for one of dressed pork; or, reducing the quantity of corn-and-cob meal to clear meal, it will be found that 3 70 pounds make one of live weight, and 4.75 pounds one of dressed pork. The same saving must, doubtless, be made in feeding other stock, and the money saved in this way alone, would very soon pay for a mill on any farm where even a comparatively few head of stock are kept. Of the numerous excellent farm mills offered to the public we know of none more cheap, durable, simple, and efficient than that whose phonetic title expresses its claims—the I-X-L. Two sizes are made: No. 2 weighs 150 pounds; grinds eight bushels of feed per hour and costs $50 No. 3 weighs 175 pounds; grinds 10 bushels per hour and costs $60. Both, it is claimed, will turn out double the above quantity of cracked corn, and from half to two-thirds of the quantity fine enough for family use. The mill is entirely of iron of the best quality, and so simple in construction that a man with ordinary gumption can put it together. It can be driven by horse-power, lever power or by an engine or a wind mill, and occupies about a yard square of barn floor. This is the second year since this mill was introduced to the public; it claims therefore to have the latest improvements, and its efficiency is amply indorsed by numerous trustworthy farmers who have used it in different parts of the country. Full particulars as to prices of repairs, mode of operating, etc., etc., will be promptly furnished on application to the manufacturers, the United States Wind Engine and Pump Co., Batavia, Ill., or by their Eastern agents, S. L. Allen & Co., 229 Market St., Philadelphia.



THE I, X. L. FEED MILL.

MESSRS. GREGG & CO. bring out this season their new Gregg Self Dump Rake. The principle on which this rake works (the torsion clutch) has been thoroughly tested, and their new rake bids fair to prove a great success. It will be placed on the market strictly on its merits, backed by the old reputation of its manufacturers.

Everywhere.

RURAL SPECIAL REPORTS.

ILL., Highland, Madison Co., Jan. 31.—We are having warm weather since the first of January, except for a light frost every now and then; we have had light rains every few days. Roads are in a fair condition. Crops for '79 were about as follows: wheat a large crop, in many places averaging 30 to 40 bushels to the acre, worth now $1.15, nearly all sold: oats, a light yield from 20 to 30 bushels to the acre; worth 31 cts.; corn, a large yield, worth 30 cts.; hay, good in quality, but a very light yield, on account of dry weather; worth from $10 to $15 the ton. C. L. R.

KANSAS, Washington, Washington Co., Jan, 27.—We are having fine weather here at this time. We had very cold weather about Christmas; but since that it has been warm and pleasant. It was quite dry here last season. Our wheat crop was light—about two-thirds of a crop; oats light; corn pretty fair; potatoes light. Wheat sells for 85c; corn, 20c; oats 20c; potatoes, 40c. to 50c; hogs, live, $3.50 to 3.65 per 100 pounds. Fall wheat looks fine and everything prospering at present. B.

KAN., La Cygne, Linn Co., Jan. 30.—Wheat sells here for $1@1.10; corn, 20c.; oats, 25c.; potatoes, 80c.@$1; cattle, $2@$4; hogs, $3.70 @3.75; butter, 15c.; eggs, 8@10c. M. C. B.

MO., Rockville, Bates Co., Jan. 30.—We are having a dry, mild and very pleasant winter. Considerable plowing is being done. Wages are now about $13.00 per month, with board and washing. Wheat is worth 90c.; corn, 18c. Corn has been 20c. until it dropped yesterday. Potatoes, 75c.; hogs, $3.50@3.65 per 100 lbs. Crops of all kinds were good last year, except Irish potatoes and the fruit crop. Fruits of all kinds were nearly a total failure. There were a few apples and grapes. J. N. C.

PA., Menno, Mifflin Co., Jan. 30.—We have had a very open winter so far, but two days' sleighing and then not very good. We had a very dry fall—drier than I have ever seen; but since some time in December, we have had wet weather, plenty of mud and bad roads. Wheat is looking very well—I think a little over the average acreage has been sowed. Wheat sells for $1.15; corn, 45 cts.; oats, 35 cts.; cattle, from $3 to $3.50; hogs $5, dressed; butter, 19 cts.; eggs, 15 cts.; potatoes, 40 cts.; horses and cows, no demand. The thermometer has not been down to zero this winter yet. D. A. H.

VT., Randolph, Orange Co., Jan. 30.—The winter, so far, has been uncommonly mild in Vermont. There have been some severe cold snaps, but they did not continue over 36 hours; very little snow has fallen, but a great amount of rain; and there is a firm pavement of ice all over the surface of the ground, that renders traveling neither safe nor agreeable. Market prices have made a slight advance from fall rates. Tramps have disappeared almost entirely, and a man who is willing to work for a fair price is not compelled to starve, or be idle. Contractors for lumber are more plentiful than for years past, and a large amount of lumber, both soft and hard wood, has been cut and piled, ready to be drawn to market stations when there is sufficient snow to make safe sledding. Farmers are more hopeful than in three years past, and are looking for better days. S. H. R.

The Querist.

ANSWERS TO CORRESPONDENTS.

Veterinary Study.

J. L. L. B., Palmyra, N. Y., presents the case of a young man with a family and with but a limited income, who would like to study veterinary surgery, for which he has a natural taste. We are asked what course we would recommend for him to pursue under the circumstances; if he can study to advantage at home, and what books would he need.

ANS.—Veterinary surgery is fast growing in importance, and any young man who is master of the profession may reasonably expect as good an income and as good social standing as can be reached by a doctor of medicine; so if other circumstances permit, our advice would be to take up the study in good earnest. To complete the study without attending some veterinary institution will not be possible, but considerable progress can be made at home. We would call the attention of this young man to the American Veterinary College, in West 54th St., N. Y., as being one of the best institutions of the kind, and the only one in the Union, so far as we know, solely devoted to veterinary science. An able corps of professors under the leadership of the dean of the college, Dr. Liautard, who is well and favorably known as a veterinary surgeon, give instruction in all the branches of the profession. The curriculum provides for a thorough theoretical and practical education, comprehending the fundamental medical sciences. The regular winter session opens October 1st and closes the latter part of April, in which time about 450 lectures and clinics are delivered. The course of study is at present completed in two winter sessions, for which all expenses connected with the tuition are $110 and $135 respectively. A free scholarship is offered to the State Agricultural Society of each State in the Union, the applications to be made to Dr. Liautard, by the Societies, before the 1st of September of each year. The young man in question can ascertain through the officers of the N. Y. State Ag'l Soc., or by addressing a letter to Dr. Liautard, if the scholarship for New York is now occupied, and when it will be vacated. Meanwhile he should study all he can at home, especially anatomy and physiology. For the latter Foster's and Dalton's are recommended, and Liautard's Vade-Mecum for the former. Percival's Practice, Bryant's Surgery and Frey's Histology should next be studied in their order. He should also study chemical physics, of which Miller's and Pynchon's are both good, and Attfield's General Chemistry. This, with a good general education, which every surgeon should have, will form a good foundation for a collegiate course.

Jersey Red and Small Yorkshire Hogs, etc.

J. E. P., Well Co., Ill., asks, 1, what are the leading characteristics as regards weight and qualities, of the Jersey Red and Small White Yorkshire hogs, and their merits or demerits generally; 2, what are the practical merits of the centrifugal creamer.

ANS.—1, There is a great deal of difference between the Small White Yorkshires and the Jersey Reds. The former are much finer in the bone and in the flesh. They are fatter, and have a much thinner skin. Their average weight is one-half less, or perhaps it will be nearer correct to say, one-third less. Two or two-and-a-half Small Yorkshires can be kept and fatted on the same amount of food required for an average Jersey Red. The Jersey Reds are probably the most growthy breed of hogs we have, and require a longer time than the Yorkshires to mature. They have more lean mingled with their fat than the Yorkshires. The objections to both these breeds, or the "demerits," as our correspondent puts it, are that the Yorkshires are too fat and, the Jersey Reds too coarse. The advantages are that the former will keep easily, mature quickly and fatten young, while the latter grow fast and large and have a long body which makes a large proportion of pork. They have strong appetites and are greedy eaters. A recent number of the RURAL gives a full description of Yorkshires, and a future number will give the history and characteristics of the Jersey Reds. We will refer our correspondent to these articles for further particulars. 2. Messrs. Whitman and Burrel write us that this creamer has been tested with very satisfactory results. We have already given all ascertained information about it, and will soon give our readers the results of the practical tests now being made. Messrs. W. and B. expect to be able to sell all that can be manufactured the coming season.

Potash.

H. J., Salisbury, Md., asks, 1, what is the relative value of sulphate of ammonia and No. 1 Peruvian guano; 2, which is the cheaper for ammoniating phosphate; 3, a good formula for a good phosphate; 4, which is the cheaper for potash—sulphate of potash, muriate of potash or S. C. rock; 5, what is the cheapest way to secure potash for the soil.

ANS.—Sulphate of ammonia contains 25 per cent of ammonia and costs $100 per ton. Peruvian guano contains 10 per cent. and costs $60 per ton. 2. The ammonia in the former costs 20 cents a pound, and in the latter 30 cents a pound. 3. You cannot make a good phosphate so cheaply as you can purchase it. The best is prepared by reducing bones with sulphuric acid; this is a troublesome and dangerous business. 4. Sulphate of potash has 40 per cent of potash and costs four cents a pound; muriate has 50 per cent and costs two and a half to three cents a pound, so that the latter is the cheaper of the two. South Carolina rock has no potash; it is a mineral phosphate of lime. 5. The cheapest source of potash is the muriate in which the potash costs five or six cents a pound. This is cheaper than it can be obtained from wood ashes.

The Twig-Borer.

W. H. B., Covington, Neb., sends us a twig of an apple tree, into which holes had been bored by an insect, and asks what insect it was and the remedy.

ANS.—The insect that does this havoc is a small beetle, the Apple Twig Borer, (Bostrichus bicandatus). In the case of most other beetles it is the larva that bores into the wood, but in this case it is the imago, or perfect insect that does the damage. It bores into the twigs just above a bud or small branch, and goes downwards to the depth of an inch or an inch and a half, the hole being about one-tenth of an inch in diameter. Small twigs thus hollowed out lose their vitality and speedily wither. The beetle is narrow, almost cylindrical, and about three-eighths of an inch long. The head is small, bent downwards and partly covered by the large thorax. The only successful remedy that has as yet been applied, so far as we know, is to cut off the twigs and burn them. To make this effectual, the search should be thorough from the start, and the twigs, cut off as soon as there are symptoms of the borer's presence.

Miscellaneous.

B. G., Arkona, Ont., is about to build an all-purpose greenhouse, and asks, 1, what is the best, cheapest and most efficient way of erecting it; 2, if a boiler is needed, what boiler and by what maker; 3, what is the nearest approximate cost of furnishing and heating a house, say 12 by 20 feet; 4, would we recommend sinking it three or four feet in the earth?

ANS.—1, This is a comprehensive question, and will require too much space to answer it fully. The best way to go to work, we should think, would be to make arrangements with a builder whose experience in building greenhouses would assure you that he knows what he is about. From his knowledge of the cost of materials and cost of labor he can make a very accurate estimate. As for the dimensions and shape of the house and its arrangement inside, the fancy can be allowed considerable scope, certain fixed principles being, of course, complied with. A house of the dimensions given can be heated with a fire without trouble. A hot-water apparatus, however, is much to be preferred, if the extra cost will be of no great moment. For manufacturers of boilers we would refer to Hitchings & Co., 233 Mercer St., N. Y. city.; they will furnish all desired information. 3, A greenhouse 12 by 20 feet can be built very substantially for $300 to $350. 4, If the site is much exposed to the wind we recommend to sink it about two feet in the ground, or three feet at the most. When thus sunk it need not be so high above ground and will therefore not be so much exposed to the wind. If the situation is sheltered, the house can be built entirely above ground, and it will be somewhat more convenient and look better.

J. P. P., Utica, Mich., asks 1, whether the Tulip tree would do well in that State, and where can it be had; 2, whether the Cow-peas would be likely to ripen in Mich. and where they can be obtained.

ANS.—We suppose that the Tulip tree grows in your forests, although Michigan is stated by Gray as its northwestern limit. By sending for the catalogues announced in the advertising columns of agricultural journals, it will be seen that most nurserymen offer it for sale. We would again call attention to the fact that success in transplanting this beautiful tree will depend greatly upon cutting it back just above the roots, so that the roots and a few inches of stem only remain. We do not know whether Cow-peas will ripen in Michigan or not. Probably they will ripen in the Southern part of the State. They are advertised in our columns.

R. C. J., Meadville, Pa., asks where he can purchase Cow-peas; if we have decided whether we would offer them free to our subscribers; whether they will ripen with him and whether we recommend them as a means of restoring fertility to poor soils.

ANS.—We find them advertised in our columns; send for catalogue. We *have* decided to send them to our subscribers, but only in trial quantities of half a gill of mixed varieties. We hope that all of our subscribers will give them a careful trial. In this way trustworthy results may be arrived at. They will ripen seeds in Pa., having ripened at the Rural Farm which is situated on Long Island. We *do* recommend them as a means of restoring fertility to poor soils.

P. W., Seattle, W. T., 1, asks how to cultivate sorghum, and where can seeds be obtained; 2, where can seed of Bermuda grass be got, 3, how to save cabbage in winter.

ANS.—1, Sorghum may be cultivated exactly like corn. Seeds can be had in any large seed store, such as D. M. Ferry & Co., Detroit, Mich. 2. Bermuda grass does not seed in this country. It is propagated from root cuttings which can be had of Southern nurserymen. Apply to Dr. W. B. Jones, Herndon Ga., or to P. J. Berckmans, Augusta Ga., or to Mark W. Johnson & Co., Atlanta, Ga. 3. Cabbage may be kept in a dry, frost-proof but not warm cellar, or the heads may be placed on the ground and covered with earth and litter sufficient to keep frost out.

A. K., Address mislaid, asks, 1, how to germinate the hardy shrub seeds sent out by the RURAL last spring; 2, which would be the better plan—to pay $60 per ton of 2,000 pounds for ground bone, or to get livery-stable manure for 50 cents per load, to be hauled three miles, for wheat or corn on clay or gravelly land.

ANS.—We must refer our correspondent to back numbers of the RURAL NEW-YORKER for instructions as to the hardy perennial seeds sent in last years' seed distribution. We shall soon give instructions as to the present distribution which will answer his other request. 2, We should prefer the stable-manure.

W. R. W., Muskegan, Mich., asks whether coal ashes and refuse lime from gas-works are good to put around fruit trees.

ANS.—Coal ashes are of little value, except as they change the mechanical condition of the soil—make it looser and lighter. Gas lime in its fresh state is injurious to vegetation. After exposure for a considerable time to the influence of the air, it is valuable for the same cause as gypsum or sulphate of lime. In that condition it is worth about half as much as freshly burned lime.

A. B. B., Chelsea, Mass., has for a long time searched in vain to find out the name of a plant in his possession, and sends us a leaf for identification, with the request that we tell him how to make the plant blossom.

ANS.—The leaf looks like that of Pereskia, a group of plants closely related to the Cacti. It has no great value as an ornamental plant; but is used as a stock on which to graft the Epiphyllum. It isn't worth while to try to make the thing bloom.

J. B., St. Catherine, Ont., asks where he can get Mexican Sweet Corn.

ANS.—Apply to any seedsman advertising in the RURAL.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, FEB. 7th.

Miscellaneous.

WHAT OTHERS SAY.

"WEALTH" says Horatio Seymour, "cannot grow in this way in Europe. There prices at which lands are bought and sold vary but little in the course of a lifetime, and all that the owner gains is the value of what he raises. He has no estate growing up under him. He cannot, as is frequently the case with us, spend each year all he earns and then leave to his family land which has increased fifty or a hundred fold in value since he became its owner. It is this fact which gives our country its swift increase of wealth. . . When the Pacific States get rid of their gold, there will be another development of agriculture more enriching and beneficial than all that can be dug from mines. God's blessings do not go with the gambling chances of finding lucre in the bowels of the earth, as it does with the industry which works with Him in bringing forth the fruits of the soil. This system improves not only farming, but the farmers as well. . . If all the statements I have made are correct, still the facts remain that the people of Europe have heretofore been able to raise most of the food they need. Why can they not hereafter, with the same labor, on the same soil, raise enough to supply their wants, except for the small amount which they have heretofore imported? These questions bring into view some facts of great interests in many respects. In the first place, where farmers own their lands, as they do with us, all that they can get for what they sell goes to those who labor upon the soil. But as a rule in Europe, and particularly in Great Britain, what is made upon farms must support at least two and sometimes four classes of persons—the tenant, who does the work, the landlords, and usually some agents or middlemen, who hire and sublet to tenants. Church rates and many other charges must also be paid. When our cheap grains reach their markets, as they will hereafter, and govern the price of produce, they disturb the existing arrangements. The tenant must have enough to live upon then as now, taxes and tithes must be paid, and only what is left will go to the owners. This class are to suffer. The conflict is not between American and British farmers, but American and British landlords. If the cost of produce falls, rents must come down, for tenants can pay no more and landlords will get no more than prices will give. The tenants' share cannot be less than it now is, and the loss must fall upon the owners.

A BIG INCUBATOR is to be exhibited at the Poultry show at Springfield, Mass., this month. Last week it was charged with 1 500 eggs, which it is now changing into chickens. The Springfield Republican says the operation is so timed that they will hatch during the show, right before the eyes of the visitors. When the eggs have been under the heat of the in-

cubator for three or four days, they are carefully examined one by one in the light which enters a dark room through an opening about as large as an egg, to show those which contain no living germ, that they may be replaced by others. The egg at that stage has a very interesting appearance. The chicken is a small spot of condensed matter on the upper side of the egg, in whatever position it is placed, the pulsation of the heart being plainly visible. The embryonic chicken has little form, the beating heart being the most noticeable thing. From it radiate in all directions half way down the sides of the egg, red veins through which the nutriment of the egg is drawn to the chicken. At a later period these veins extend all around the egg and a plainly marked umbilical cord connects them and the chick. Before hatching, the material of the egg is all passed through the chick's heart and becomes vital tissue, and one-third of the egg is left an open space, which allows of movement of the head sufficient to chip the shell. The chick always breaks the shell with its head under the right wing. Examination of the process of incubation shows that unless the eggs are turned, not all the substance is taken up, and the chicken is small and weak. A natural instead of an artificial hen turns them in the nest.

A GOOD VERMIFUGE.—Dr. A. S. Sweet, of Southold, L. I., in a communication to the Medical Brief, recommends the following mixture:

Santonin	15 grains.
Fluid extract of pink root	160 drops.
Simple sirup to complete	2 ounces.

Mix. Sig. A teaspoontul morning and night.

It was given about equally between four children of one family and one of the neighbor's children. The result was the expulsion of sixty-seven long worms. He adds: "As having a possible bearing upon the question whether worms cause any special symptoms by their presence in the intestines, allow me to say that the child for which the vermifuge was particularly desired, had, previous to taking it, several attacks of convulsions. They ceased with the expulsion of the worms." [We have tried essentially the same recipe for worms in young setters and pointers, always successfully. No doubt it would prove beneficial if administered to other animals so affected, increasing the dose to suit the size and age. Eds.]

GLUCOSE.—The Confectioners' Journal says that confectioners are using great quantities of glucose sugar, because from its uncrystallizable quality it tends greatly to keep certain classes of goods soft for a greater length of time, and retards granulation in other kinds, and because it saves greatly in the cost of all articles with which it is combined.

It was proved before the Congressional Investigating Committees that vast quantities of glucose, or corn-starch sugar, were sold to sugar refiners; also, that it is sold in great quantities to confectioners. Glucose is now largely used in mixing with California honey, one gallon of glucose to one of honey. It is also used largely in the Eastern States in the manufacture of all sweet wines, lager beer, and all liquors requiring sirups. In fact, corn sugar is now used for all the various purposes for which any sugar is used, except for first-class confectionery. Glucose is also shipped in large quantities to Europe, where it in great demand.

GRASS VS. SWEDES FOR SHEEP.—Grass has 70 per cent. of water and swedes 90 per cent.; consequently the former has 30 per cent. of solid matter, while the latter has 10 per cent., there being thus three times as much solid matter in 100 pounds of grass as there is in the same weight of turnips. Therefore when a sheep eats 20 pounds of grass it swallows only 14 pounds of water, as compared with 18 pounds in a similar weight of swedes, and it partakes of as much as six pounds of solid matter with that weight of the former vegetable as against only two pounds in the latter. The difference may be stated in this form. When a sheep consumes 10 pounds of solid matter in the form of grass it swallows in the process only 30 pounds of water, whereas in eating only 10 pounds of solid matter in the shape of turnips it is under the necessity of swallowing no less than 90 pounds of that cold liquid.—N. Y. Tribune.

A GOOD HARVEST in England, a good harvest in France, a good harvest in America—of these prospects the first two are hardly likely to again fail us at one and the same time, says the London Farmer. As regards the third prospect, it may in some sort be regarded as assured, seeing that a largely increased wheat acreage in North America should give next summer an equal surplus to last year's abundance, even in the case of the yield per acre being 10 to 15 per cent. under the average. As regards what prices will be nine months hence, opinion is, of course, to a very great degree speculative merely; but, inasmuch as wheat harvest has to be prepared for nine months in advance, farmers to-day must take some view on the subject. And without simply saying "ditto" to Lord Thurlow, we ventnre to offer them the opinion that the wheat sown now is more likely to be sold at a loss than at a profit before the year is out.

OUR DAIRY INTERESTS.—"From returns received from the United States," says Mr. Pye, (England), in an address; "it appears the dairy interest has grown into one of a great magnitude, the number of cows actually being over 11,000,000, whilst in England we have only some 2,250,000, a fraction more than one-fourth of those in the United States.

The importation of fresh meat to this country has greatly increased; the enormous quantity of from 25,000 to 30,000 tons having been imported during the last twelve months, and the senders seem to think this only the beginning of the trade.

At one time the 3,000 miles of ocean, and the great expense of inland carriage, formed a very formidable protective duty, which, no doubt, was nearly equivalent to our extra expenses. During the last few years, owing to the increase of railways and the use of large ocean steamers, this protective duty is in a great measure done away with."

THERE IS A STORY on record, somewhere, of a London cigar seller, who was prosecuted by the authorities for defrauding the revenue. The tax on tobacco, imported into England, is excessive, nearly a thousand per cent. In his defense, the cigar-maker maintained, and proved so conclusively to the authorities that he used no tobacco in the manufacture of his wares, that he was discharged. They were made entirely of oak leaves, cabbage leaves and similar materials.

To like effect, the makers of all kinds of intoxicating drinks could easily plead, if any confidence can be placed in the numerous hand-books, openly advertised and sold, which profess to teach the mystery of compounding liquors with such skill as to deceive even the most practiced judges.—Thoughts and Events.

AGE OF COWS IN RELATION TO THE YIELD OF MILK.—The age of cows has a great influence on their yield of milk. After her first calf, a cow does not give as much as after her second or third. At the fifth or sixth calf, the average yield begins to decrease steadily. It may be seen from this, that one ought only exceptionally have older cows than eight or nine years, as after these years the milking qualities are generally on a rapid decline, and, besides, the cows are harder to fatten. As young animals produce more from the same quantity of food because their assimilation is better, there is every reason for not keeping the cows too long. A good dairy cow is (on the Continent) expected to yield not less than 2000 quarts of milk a year; a very good one, 2300 to 2500 quarts; but higher numbers are not rare in almost all breeds.—Agricultural Gazette.

IS MILK FEVER CAUSED OR PREVENTED BY MILKING DRY AFTER CALVING?—Although the practice of some parts of the country appears to discountenance the clean milking of newly-calved cows, says the Ag. Gazette, the nature of milk fever justifies the conclusion that the cow liable to this disease should have her bag drawn dry as soon as she calves, and that the operation, if needful, should be repeated several times daily. No harm, we believe, results from milking thoroughly three times a day, or oftener; much harm, on the other hand, may ensue from allowing the milk to accumulate, as it is apt to do in a good cow in the prime of life in high condition, and milked only night and morning.

NEW MODE OF ADMINISTERING CASTOR OIL.—To the oil add sufficient pulverized sugar, flavored with cinnamon or lemon, to convert the whole into a plastic dough: then form into boluses. Compound licorice powder may be substituted for the sugar. Children, says the Boston Journal of Chemistry, quarrel over this confection. For grown people the boluses may, in some instance, be enveloped in wafer-paper.

BARLEY FOR YOUNG LAMBS.—Reverting again to the subject of barley, it may be as well to mention that, good and wholesome as we have found it to be for ewes and grown sheep, it is a very dangerous food for young lambs. It affects them with a scour which very often ends fatally.—Ag. Gazette, Eng.

CERTAIN FACTS appear to be perfectly clear, says the journal above quoted, America will steadily and rapidly develop as a producer of grain and flesh. Production is there incomparably cheaper than it is in England. Transit will tend to become easier, cheaper, quicker; and we, with our high rents, high living, and high expenses in general, will find ourselves handicapped to a serious degree. Even as to quality there is no doubt they can in many cases outvie us, as, for example, both in wheat and fruit.

CATALOGUES, ETC., RECEIVED.

JAMES J. H. GREGORY, Marblehead, Mass. Catalogue of Warranted Vegetable and Flower Seeds, free to all—and all should apply for it. There is no other catalogue which we look over with more pleasure and instruction.

This catalogue is profusely illustrated and especial attention is called to many new or excellent kinds of seeds, among which we may note Egyptian Sweet Corn, Longfellow's Field Corn, Early Amber Sugar Cane, White Russian Spring wheat, the Turk's Turban and Alpha Tomatoes, Defiance Asparagus, (which is deemed far superior to Conover's Colossal), the newer sorts of Potatoes, &c., &c.

E. P. ROE'S New Descriptive Catalogue and price-list of Strawberry, Raspberry, Currant, Gooseberry plants and Grape vines; Cornwall-on-the-Hudson, N. Y. While looking through this interesting catalogue, it is very gratifying to the RURAL to see that Mr. Roe gives the best praise to those new varieties of small fruits which the RURAL NEW-YORKER from its own tests has spoken most highly of, because it affords excellent evidence that our reports have been the results of unbiased observation. We presume that all of our readers who are interested in small fruits will be glad to send for this catalogue, as Mr. Roe has earned a wide reputation as one of our most intelligent and experienced small-fruit growers.

B. K. BLISS & SONS, 34 Barclay St., N. Y. Illustrated Hand-book for the Farm and Garden, and catalogue of garden, field and flower seeds. This book cannot be described in a few words. It is one of the most complete of any works of the kind published in this country or elsewhere. It is illustrated from beginning to end with wood-cuts of all sorts of plants and also by a really beautiful colored plate of New German pansies painted from life. If this firm is distinguished more for one thing than for another, it is for the introduction of novelties, many of which, especially among new potatoes, are well and favorably known both at home and abroad.

JOHN SAUL, Washington, D. C. Catalogue of rare and beautiful flowers and garden seeds, &c. Mr. Saul issues eight catalogues, (the present is No. 2.) all of which are sent free to applicants in their seasons. Thus special consideration is given to fruit and ornamental trees, evergreens, shrubs, roses, bulbs, orchids, etc., etc. Mr. Saul is among our most enterprising nurserymen and is quick to procure the latest novelties. The Rural Grounds are indebted to him for several fine plants, some of which have already been, and others of which will be, referred to in these columns.

THE NATIVE FLOWERS AND FERNS of the United States, by Thomas Meehan. The American Natural History Publishing Co, Philadelphia, Pa., Publishers. We are now in receipt of Parts 13, 14, 15 and 16, of Vol. II, Second series. Each Part contains, as heretofore, four beautiful colored plates of the plants described in the text. Among them we are glad to see that grand old vine, the Trumpet-Flower, Tecoma radicans, and the brilliant Cardinal Flower, Lobelia cardinalis.

THE DINGEE AND CONARD CO., West Grove, Chester Co., Pa. "The New Guide to Rose Culture." Probably the largest Rose nursery in the world. All lovers of the "Queen of Flowers" should send for this "guide." We can assure our readers that all orders will be liberally and promptly filled. The D. & C. Co. have well earned their high reputation and unparalleled success. Catalogue sent free to subscribers.

SYRACUSE NURSERIES, Smith & Powell, Proprietors, Syracuse, N. Y. No. 1 is a descriptive catalogue of the fruit department; No. 2, descriptive catalogue of ornamental trees, shrubs, vines, roses, green-house, bedding plants, &c. This is one of the oldest and largest establishments of the kind in this country, the area occupied under cultivation being about 500 acres.

ALFRED BRIDGEMAN, 876 Broadway, New York. This is a large, bright, descriptive catalogue, accurately illustrated, that one can read without spectacles. The lists of vegetable, grass, herb and flower seeds, garden tools and horticultural books are very complete, and the establishment is one of the oldest and best. The Catalogue will be sent free to all.

RESULTS of soil tests of fertilizers for 1879, conducted under the direction of the Com. of Agr. of Ga., with comments on the results of experiments—a very useful work for all about to buy commercial fertilizers, especially in the South, as it shows their worth in actual field tests.

WHOLESALE PRICE-LIST of small fruits, &c., grown and for sale at the Pleasant Valley Small Fruit Nursery, Moorestown, New Jersey. John S. Collins, Proprietor. Engraving of the "Kieffer Hybrid Seedling Pear," twelve inches around and weighing 18 ounces.

COLE & BROTHERS, Pella, Iowa. Illustrated Catalogue and Guide to the Flower and Vegetable Garden, free to all. We see that this enterprising concern offers the Golden Rural Tomato.

THE Record Almanac, issued by that marvel of journalism, the Philadelphia Record, a paper that sells for six cents a week, and, as compared with the cheapest of other papers, is worth double that money.

LUTHER BURBANK, Santa Rosa, Sonoma Co., Cal. Catalogue and price-list of Santa Rosa nurseries. Trees, plants, seeds. Australian seeds—Native Californian tree, shrub and flower seeds.

REPORT of the Connecticut Board of Agriculture and Experiment Station for 1878. An excellent work, well gotten up.

C. M. SILVA & SON, Newcastle, Placer Co., Cal. Descriptive circular and price list of trees and plants.

The Poultry Yard.

DORKINGS FOR EGGS AND MEAT.

IN the RURAL NEW-YORKER for Jan. 31, Nelson Ritter gives a plain and practical account of his hens' doings for the last 13 years. Such letters are valuable to those who read them and wish to profit by them, while not a few readers will glance at the account and then forget it forever. Mr. Ritter says, "In looking back over these years I discover many mistakes made, that lessened the profits. They can certainly be avoided hereafter; but whether others equally detrimental will not be made, is not so certain." It seems by the above quotation that Mr. Ritter will be benefited whether the readers of his paper will be or not. That is the true way; in all our experiments, we should have an eye open to improvements, and also watch our failures, so as to avoid them in the future. A few years since I bought a pair of Cayuga ducks for my son, a lad of 10 or 12 years of age at the time, the pair costing $5. In two years' time he had paid me back the purchase money and had saved for himself $50. They were sold for breeding purposes. He bred some that took first premium at our State poultry show. They were selected by poultry fanciers and breeders who had not as good of their own as my son had; still they get the credit, but my son sold his ducks and that was what he wanted.

About the same time, having the poultry fever in its mild stages, I purchased some fancy fowls; in the course of eight or ten years I tried a number of breeds without much success on my part. One trio of Light Brahmas, from a breeder who advertised quite extensively, we were so disgusted with that we fattened and sent them to pot without ever breeding from them at all, although they cost us a good round price. After going the round of six or eight of the so-called best breeds, we got a trio of Silver Gray Dorkings and from them we have now a flock of 30 birds that please us better than any other sort we have ever had. From those we have bred, we have frequently let fancy-poultry men have birds that took first and second premiums at our State fairs, and poultry shows. Last fall at Utica we helped in that way to furnish a prize coop; so that our fowls are not only useful, but fit to show as well. We sell neither fowls nor eggs except on such occasions. We use all our eggs in our family, and the chickens we raise—except an occasional basket of eggs to some friend, or a chicken for some sick person, or to a friend for a holiday treat. Usually Dorking eggs will weigh a pound to seven eggs. The hens are very quiet, good mothers; the chicks feather out early, and with me are hardy. That they are the best breed for all purposes, I am not prepared to say; but, as we treat fowls, they are certainly the best, we think, of any breed we ever had for eggs and chickens to use in a farmer's family, which is what we keep hens for, usually keeping about 25 for that purpose. I carried to a friend in town a few years since a basket of four dozen eggs; afterwards he said he never before knew there was any difference in eggs, but after using those I brought him, he said he would almost as soon have one dozen such eggs, as to have two dozen he could buy in the market.

Mr. Ritter gives good advice when he tells RURAL readers to take good care of the hens they have, and if they are doing well, they had better not change, nor be misled by glowing advertisements. Probably for most farmers an exchange of cocks, however, from some other yard would be of great benefit, whether of the same breed or not. Farmers who raise hens for their own use, both in eggs and chickens, will usually want a fair-sized bird, so that when one is killed for the table there will be something to show when dressed for that purpose. One thing is certain—good care and liberal feeding will pay best in the end with fowls, as well as other farm stock.

Rome, N. Y. J. TALCOTT.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, FEB. 14, 1880.

SHORTLY TO APPEAR.

On The Kinver and an entirely new French Yellow Globe Mangel as sweet as a sugar beet and as productive as other mangels—illustrated.

Leguminous Plants—grasses and valuable fodder plants, by Professor W. J. Beal—illustrated.

Stock Notes by Professor E. W. Stewart, L. S. Hardin, Richard Goodman, M. C. Weld, Col. F. D. Curtis, A. B. Allen and others.

Important Addition to the Rural's Seed Distribution.

Special Articles from Professor S. W. Johnson, Professor F. H. Storer, Professor G. C. Caldwell, Dr. A. R. Ledoux.

A Series of short articles upon the cultivation of our choicest vegetables—illustrated.

Dairy Specialties by Henry Stewart, L. S. Hardin, Professor L. B. Arnold.

Fruit Notes by Pres. T. T. Lyon, Gov. Furnas, Dr. T. H. Hoskins, Sec. Garfield and others.

Poultry Notes by Forrest K. Moreland. Henry Hales and others.

Life Engravings of the Chinese Yam (Dioscorea batatas) "Cinnamon" vine; the Tulip tree and fruit &c., &c., &c.

TO NEW SUBSCRIBERS.

We find that many of our new subscribers have not seen our Free Plant and Seed Distribution supplement and consequently know nothing as to its terms. We will therefore send this supplement free to all who apply until further notice.

As announced in our late issue, we can no longer supply back numbers of the Rural New-Yorker. Papers will be sent for one year from the date of the receipt of all subscriptions.

The increase in the business of the Rural New Yorker has made a change of location necessary. We have leased for a term of years, one of the most central and prominent buildings in this city, of which we shall take possession the first of May.

It gratifies the editors of the Rural New-Yorker very much indeed that the new catalogues of 1880 give praise and prominence to the many kinds of plants as well for the vegetable, small fruit and flower garden as for the field that have been tested at the Rural Experiment Grounds and favorably reported upon in these columns. Such references from many of our best seedsmen and nurserymen are proofs that our tests have been made impartially, and that our reports are worthy of the confidence of the public.

Our formidable seed distribution was begun last week. We have never before, in any subscription season, received so many undecipherable addresses and we have consequently never before received so many complaints that "the Rural don't come!" As we are obliged to direct our seed and plant wrappers as applications are received, no doubt there will be a correspondingly great number of miscarriages. As soon, however, as the distribution is completed, we shall inform our readers, so that they may have the opportunity of making a second application by postal or otherwise.

Many of our readers request that we will give instructions as to sowing the seeds of the Rural's distribution. As we cannot very well repeat such instructions, we shall wait yet a week or so, and then give them once for all. We have yet to announce the addition of one valuable kind of seed to the list—a new golden mangel-wurzel, which we have imported from France, and which has never (so far as we know) been tried in this country. In connection with this, it has been suggested that we offer our subscribers a prize for the heaviest specimen produced from the seed we send. But this has not been settled as yet.

The leading varieties of pear hawked for sale in the streets of London, according to the Gardener's Chronicle, are the Windsor, (Summer Bell, a coarse astringent pear), Summer Doyenné d'Eté, William's Bon Chretien (our Bartlett), Hessel, Beurré Bosc, Louise Bonne of Jersey, Beurré de Capiaumont, Beurré d'Amanlis, and Beurré Diel. The model pear of the Londoner is the Bartlett. It is a criterion by which he judges of the value of every pear he is called upon to partake of. In Edinburgh the modern Athenians swear by the Jargonelle, which, though pretty, is of poor quality.

It is to be wondered at that farmers never, or rarely ever, raise potatoes from seed, by which we mean the true seed found in the potato "ball" or proper fruit of the potato plant. Seeds germinate as readily as those of lettuce or radish. A small patch of seedling potatoes could be cultivated at a small expense and a trifle of labor, while each farmer might, in this way, produce varieties of potatoes more valuable and productive for his particular soil and climate than any that could be purchased. At any rate, the chances of such results would be worth the trouble of striving for them. We have, at present, not less than 100 little potato plants growing in our conservatory. These will be set out in the spring, and the little tubers which form during the growing season will be preserved in sand for another year. The second year these little tubers form large tubers, when their quality may be tested—the good kept for "seed"—the inferior eaten. Save the potato balls and try the experiment.

HELP FOR IRELAND.

Ireland's wailing cry for food should no longer be heard unheeded. Her distress is actual and terrible. With outstretched, emaciated arms she implores the civilized world in the name of God and humanity to give food to her starving people. Not less than 300,000 souls are at present without daily bread, and the distress is increasing day-by-day. It seems, indeed, strange that a province of the most prosperous nation in Europe, situated at the very hearthstone of the sovereign, should thus be wanting a scant livelihood.

Her most Gracious Majesty, the Queen, and all members of the royal family live in the most pompous style. English aristocracy lounge in luxury. Irish landlords yearly squander enormous sums, the proceeds of the toil of Irish people, in Paris and other places. Yet the people who so labor to support this royalty, this aristocracy, the subjects of the British crown, die for want of food. Is there nothing wrong in this? Are the people insubordinate rebels if they dare whisper a protest against this state of things, and refuse to die with laudations of landlords and English rule upon their lips? True, they are ignorant and unthrifty, but whose is the fault?
